One of these factions of Americans, led by the Japanese-American Relations Committee of the San Francisco Chamber of Commerce, believes that the problem of this Asiatic empire in America can be met best at a council table, around which are to be seated representatives of all the nations surrounding the Pacific, or whose interests in this coming center of world-commerce and political activity are vital. The head of this faction in California, and, it might be said, on the Pacific Coast, is Robert Newton Lynch, vice-president and manager of the San Francisco Chamber of Commerce. The head of the parallel, national faction in Japan is the Viscount E. Shibusawa, who arrived in San Francisco late in October, and, at this writing, was still in the United States, with his party, returning the visit to Japan last year of the American-Japanese Relations Committee, of which Frank A. Vanderlip was the head.

This faction believes that the problem of the Japanese in California is a part of the greater problem of Japan at home and in international affairs, and that all the nations of the world should assist—not oppose—Japan in settling for all time the question of allocation of her surplus population. As best explaining this somewhat international point of view in trying to reach a settlement of what the majority of white people in the affected states regard as a national problem, I cannot do better than quote directly from Mr. Lynch, who says:

"The Pacific problem is the problem of the world. A solution of Japan's relation to that problem is the prime consideration of the thinking force of the other nations. The whole Pacific problem circulates around Japan. Her character and her ambitions and her internal development must affect this in a most profound manner. The problem is primarily one of expansion. Japan has 70,000,000 people on the main island of Japan, Korea, Formosa and the other possessions she now occupies. She has an area less than that of Texas. She is growing at the rate of a million a year, and she is facing the necessity of providing food or emigration, or an industrial development, for all those 70,000,000 and for the increase in numbers of her people. While it may be said that mere breeding does not involve obligations on the part of the remainder of the world, yet Japan, as a great unified force, developing at the rate she is, must find some way out. As she struggles for a way, of course, she comes against the inevitable feeling of the white race that there is no practical assimilation. She finds that she is unacceptable, because the very fairest minds, and those who have no prejudices on the subject, do not favor for a moment the problem that is involved in the attempt to add to our population a large number of unassimilable people, backed by a very powerful and sensitive government. . . .

Above—Pupils of one of the public schools in Sacramento County, California, showing the preponderance of Japanese. At the grammar school in Florin, of the total enrollment of 147 children, 101 are Japanese. In the afternoon and evening, these Asiatics attend a school in their own language, held in the Buddhist temple of the town in which they live. Center—Typical Japanese retail stores in a California town. This is a scene in Penryn, California, showing the manner in which these aliens depreciate the appearance and value of property as soon as they acquire it. Below—A block of a once exclusive residence street in Berkeley, California, invaded by a Japanese tenement house, shown at the left, directly back of the automobile. Houses along this street, which, prior to the coming of the Japanese, changed hands at $10,000 to $12,000 are now offered at $7,500 with no buyers. Twelve of the fourteen American houses in the block are for sale.

"The New Japan"

THE three Pacific Coast states, the buffers of Occidental civilization, and of American ideas and ideals against the yellow tide of the Orient, are generally designated by the Japanese as the "New Japan." Every utterance and every act of the Japanese points to their determination to develop the Japanese race in the United States, and to create for them a position from which they cannot be ousted—in short, to make of this country a province of Japan. The Japanese in the United States never discuss or consider the development of themselves or their children as American citizens who have severed all connections with Japan, but only as Japanese who are establishing their race in a particularly favored land. It is to this end that they are openly urged by their speakers and writers, in district meetings and in newspapers published within the United States, to obtain land and to beget children.

Japanese "Expansion"

IT IS urged in reply to the effort of the Pacific Slope to cut from her side the malignant growth of an Asiatic empire that Japan has the right to expand; that she must find an outlet for her annual increase of nearly 1,000,000 in population; that that outlet must be to other countries. To this defense, John S. Chambers, former controller of California, and now president of the Japanese Exclusion League, replies:

"This statement is flatly untrue. Japan has plenty of room within her own borders. Let her people settle on the 5,000,000 acres of land which her own government admits can be reclaimed. Let them spread to the northern and almost uninhabited islands, where there is room and land for millions, with opportunities for wheat and other grain and cattle production. Let them go to the island of Formosa, or to the great peninsula of Korea, with ample room for not less than 10,000,000 additional population."

"Then, Japan has an enormous industrial problem; those who visit Japan and see the efforts which she is making to translate herself from a nation of workers in homes to a factory system, will appreciate what an enormous problem that is. Then, of course, Japan has the problem of education, and the problem of government, for there is a feeling abroad that Japan has a form of government that is unadaptable to the ideals and to the modern situation among the other nations with which she must co-operate. But the things that we have met in the past 25 years, must come upon Japan, if necessary, within five years. Her leaders and her thinkers must meet those conditions which exist in the rapid transition of her country into a great industrial nation, essential to the care for and the feeding of her people . . . .

"Temperamentally, Japan has tremendous problems of adaptation, because, as she goes out among other peoples, she has to adapt herself, with perhaps not the genius for that particular adaptation. Clever as she is in her superficial adaptation, it is felt profoundly and fundamentally by other nations that Japan remains thoroughly Japanese and cannot mix upon terms of equality. One of the greatest difficulties we have in California with the presence of a large number of Japanese is and will be that inevitable conflict which arises from the fact that the Anglo-Saxon race never will consent to dwell with any other people unless they dominate them. But Japan has precisely the same ideals, and the same stiff-necked and stiff-backed attitude of us Anglo-Saxons is present in Japan, with her lack of adaptivity. And we have not desired that problem, because of the inevitable conflict. . . .

"These, in outline, are some of the problems Japan must face. But they are not only Japan's problems; they are the world's problems. They must be solved, not only in the interests of the Japanese, but they must be solved in the interests of the world. If we beg the question in advance, and say these problems have no solution, then we can only look to certain conflict between an organized Orient and the rest of the world. If we, on the other hand, could sit at a conference table around the Pacific, and if we could help Japan, and if Japan could see that the suggestions are made in a friendly attitude, because of inevitable circumstances, there might be a possibility of working out a pacific development of this great Pacific problem. There might thus be worked out some co-operation in regard to the conduct of the tremendous commerce which is going to be borne on this ocean of mystery."

This point of view, this proffered solution, is commonly regarded in California as a purely commercial offering, a sort of sop thrown, unintentionally perhaps, to the Asiatic Cerberus. It is generally considered fortunate, in Washington, Oregon, California, Idaho and other states which have come into close and unpleasant contact with the Oriental colonists, that this solution is not generally accepted.

California, through its legislature, both houses, jointly concurring, has spoken, no later than last year, its majority opinion as to the solution of the problem of the Japanese Empire within the United States, and has forwarded that solution to the President of the United States, to the Secretary of State of the United States, and to the Congress, through the California senators and representatives in that body. This document, which is likely to become historic, appears as Senate Joint Resolution No. 26, by Senator Will R. Sharkey, and reads:

Whereas, The Japanese Exclusion League of California, representing officially such organizations as the American Legion, War Veterans, Native Sons and Native Daughters of the Golden West, State Federation of Women's Clubs, State Federation of Labor, and various other patriotic, civic and fraternal bodies, have adopted a statement of policy recommended for adoption by the Government of the United States as urgently required in protection of the nation's interest against the growing menace of Japanese immigration and colonization; and

Whereas, Said declaration of principles has been approved by the organizations affiliated with the League—The Los Angeles County Anti-Asiatic Association and the Japanese Exclusion League of Washington; and

Whereas, Said declaration of principles is in words and figures as follows, to-wit:

First—Absolute exclusion for the future of all

Propagandists Impose on the American People

A Study of the Amazing Network of Influences Which Flavors or Poisons the American's Daily Thought

By LEWIS HARPER

A LARGE number of the bills in Congress are introduced for no other purpose than to get stories about them on the press association wires. Certain Senators and Representatives are eager to fall in with "stunts" of this kind to get the incidental publicity involved. Many of them are induced to foster bills the significance of which they do not understand.

Washington is honeycombed with propagandists and publicity engineers calling themselves "liberal," "radical" or what not. They occupy scores of offices. The corporation lobbyist is outnumbered five to one by these new agents of "special interests." There is good money in the business, too. It would be interesting to know how many men have been making a good living out of the well press-agented campaign waged ostensibly to liberate Tom Mooney from the penitentiary. Debs' imprisonment was a wonderful revenue producer. Workingmen are not the only sources of this easy money. The hat is passed freely among them, but there are large numbers of opulent citizens, some poseurs, some smitten with socialism, who can be relied upon to contribute to any sort of organization that promises to stir things up.

Some of these have to be baited by being made vice-presidents of organizations with high-sounding names indicating the uplift. Others contribute more indiscriminately. Among the shining marks on this sucker list are a number of dowagers and maiden ladies of old American families which have transmitted heritable wealth to them but seem to have failed to transmit the qualities that made the fortunes originally.

Spreading Soviet Propaganda

WHAT is true of Washington is true of New York and other cities in lesser degree. The country is dotted with "news" mills where pinkish news is manufactured. Sympathetic hands are at the helm in many press association bureaus to accept and forward this "news" without much deletion and without enlightening statements indicating its origin.

One of the press bureaus at Washington after the Armistice was dominated by parlor communists. One of the correspondents who accompanied President Wilson on his first journey to Paris told the writer on his return that the President was the greatest Bolshevist in the world, and that he and Lenin would join hands to make the world over after the President had demolished the existing European governments. He believed it. It was in the air. The country was drenched with Soviet propaganda in the early part of 1919 and most of it came through the regular news channels.

Much of this stuff "gets by" because of the time limitations and the other pressure under which news is handled both at the sending and receiving ends. If the story looks good, neither the correspondent who sends it nor the editor who receives it has time to analyze its origin or to edit the propaganda out of it.

In Washington especially, the war brought on an era of official "hand outs," prepared stories, and "statements" which almost superseded the old-time, first-hand, personally investigated stories by competent and critical reporters. In fact, the war weakened the whole news handling personnel because so many of the best men entered the army or went oversea as correspondents. Others went to big industrial concerns as publicity men and were replaced by less capable men.

Among the standard press agent "stunts" to get publicity for communist propaganda is the formation of "leagues," "councils" or the launching of "movements." Scores of these alleged organizations have been formed for no other purpose. Examination of their rosters and the lists of their directors, delegates or vice-presidents discloses the same old names used over and over again. Men like the Rev. Dr. John Haynes Holmes, Amos Pinchot or Scott Nearing would have to hire a truck if these organizations required their members to carry membership cards.

College Women at the Meetings

OF COURSE, every new "league" or "movement" promptly sponsors a mass meeting or a series of them all over the country. The same crowd turns out to them all—*90 per cent from the cloak and suit trades and 10 per cent from the alumnae of the colleges for the higher education of women,* which are producing a huge crop of socialist spinsters from the American stock, which seems to prefer to do social work among the children of strangers rather than to have babies of its own.

The mass meeting produces some good copy—plenty of paprika in the speeches and usually a word battle with the police which can easily be written into a riot by a sympathetic or news-hungry reporter. This gets on the wires, and out in the distant smaller cities of the country it reads like a real popular upheaval in the big cities. Even smart politicians are deceived by this sort of thing. Two or three mid-western Senators who got off on the wrong foot at the beginning of the war mistook meetings of this sort in New York and Philadelphia for the pulse of the American people.

Most newspaper men are aware of all this, but they still feel constrained to print this stuff because it is news after all—technically at any rate.

It is not balanced and neutralized by news of the sentiments of the saner elements, because they are mostly inarticulate. They are at work or at home, while the other crowd is mass-meeting and passing resolutions. Their temperament makes it impossible for them to originate the same quantity of "news" as the frothy sort. Most of them have no time for it. Those who are doing the world's work must keep on working to feed, clothe and house the nation, including those who are seeking to tear down the industrial system which makes the existence of large masses of mankind possible.

The real "leisure class" in America are the shouters and babblers who spend their time telling the actual workers how the world ought to be run.

The psychological reason why so many busy molly-coddles—male and female—are engaged in the work of socialist propaganda is that they are unfit to excel in the game of life, know this inwardly, and seek to conceal it both from themselves and the world by posing as "bold, bad radicals."

The work of these propagandists is helped *by the economic and mechanical* conditions limiting the handling of news. Wire space is limited. Paper is costly. The length of stories is limited, and the expressiveness of headlines is curtailed by the fact that only a limited number of words can be made to fit the width of a page or column. This works out in this way. Any propagandist organization which pretends to represent, say, "Women," "Farmers" or "Labor" will get its stories printed as the utterances or acts of "Women," "Farmers" or "Labor" rather than as the performance of a crew of communist press agents, because it takes too much space to tell who they really are.

Some of the organizations which appear in the wire news, especially from Washington, as voicing the opinions of American women, do not number one normal American woman in their membership.

Many of these organizations are composed of neurotic types, some of them psychopathic. At one time in 1917 several women who had escaped from sanitariums were participating in feminist demonstrations in Washington and giving the police much trouble. These activities were "hitting the front page" every day. Eventually their physicians rounded them up and separated them from the rest of the flock.

Among the Washington lobbyists and press agents who frequently figure in the press dispatches as a "representative of the farmers" is a former Greenwich Villager who made a living for some years as a single tax and municipal ownership "expert" in New York. Maybe he lived on a farm once upon a time, but it was a long time ago. His advanced ideas on matrimony, which included the doctrine that husbands should not support their wives, once earned his bride considerable newspaper publicity.

Newspapers Help Very Little

THE genuine representatives of organized labor—the real leaders of American workingmen who have come up from the shop, mine or railroad, get scant consideration in the news dispatches compared to the "intellectual" poseurs.

It is a strange fact that the only really effective exposures of parlor sovietism in America, the only real fight waged on pinkism has been made by the leaders of the real American labor movement. They have received scarcely any help from the newspapers. The most masterly exposure of the betrayal of labor and the reinstitution of slavery in Russia was made by the American Federation of Labor in a report of its executive council. This historic document got scarcely any publicity in the newspapers. The same newspapers have been victimized by practically every propaganda scheme hatched here for the benefit of Moscow, beginning with Ludwig Martens' efforts and continuing to the present day. The livid hatred of these pseudo-laborites and their intellectual allies for the genuine American labor movement exceeds their ferocity toward "capitalism." The manner in which the syndicalist movement and Bolshevism have been encouraged by some large capitalists and helped by some publishers suggests that they may be using the pinks and reds to destroy legitimate unionism.

The hue and cry, for example, against the railroad workers' groups—American to the core—has been raised by newspapers which have had not one word to say against the needle workers' unions, which in collusion with their employers have skinned the American people out of billions of dollars and clothed our nation in shoddy.

No survey of the propagandizing of the press can be complete without noting the extent to which politicians and office holders, especially Senators and Congressmen, pick up and disseminate radical propaganda. Some of it is foisted upon them. Some of it they use deliberately in their search for votes or the limelight. A whole lot of this stuff "makes" the newspapers because of the official position of the man who utters it, which gives it a quasi news value. Here's an instance:

"For every American soldier who died in battle, the war gave us a new millionaire," quoth or rather shouted, the more or less distinguished United States Senator who represents a large number of abandoned mining camps. Into the Congressional Record it went.

For some reason it did not make the press association wires that day. The boys in the press gallery for some days past had been "fed up" with this kind of stuff and had sent out thousands of words in the same strain. The press association men passed it up as old stuff. Not so the feature services which "interpret the news" by mail. They sent it out and it lost no fat in the retelling and "interpretation." It was good stuff—the people like to be told they are robbed. The yarn about the 23,000 new millionaires appears to have originated with one of the weird statisticians who flourish in Washington. Some of them are able men and know their business, some are pipe dreamers and can concoct Arabian Nights out of the census returns and the Interstate Commerce reports.

The 23,000 new millionaires are now a rock-ribbed article of faith with millions of people, many of whom scoff at the story of George Washington and the cherry tree, but the income tax returns for 1919, the year after the war, failed to disclose them.

Those disappointing tables tell us that there were considerably less than 23,000 individuals in 1919, who received the interest on a million dollars as their annual income. The Senator's 23,000 *new* millionaires are strangers to the Internal Revenue Bureau. Indeed, a study of the income tax reports for the war period seems to reveal that the big incomes decreased both in numbers and amount. The "yellow rich" are not getting richer, and did not get richer during the war. In fact, if their taxes are deducted from their incomes, it appears that they received about half their annual spending money during the war.

Muckrakers at the Helm

BUT nothing will ever get the 23,000 new millionaires made by the war out of the public mind. They are there to stay. They have been the subject of many editorials, soap-box speeches and sermons by advanced ministers.

The editorial personnel of the newspapers is peculiarly receptive to the sort of propaganda which flows to it because so many of the executives and writers got their training in the muckraking era.

Many of the ablest men now in the business were ardent muckrakers a few years ago. This was natural. It appealed to the virile and the adventurous. It was something new then, it had thrills and an element of risk. It enlisted men of generous impulses and sporting instincts. It looked like the dawn of a new era in American democracy, and approached the fervor of a crusade by the time it got to Armageddon in 1912.

The old war horses of the muck rake and the Rooseveltian uplift have not got over their education. They are still suspicious of the tyranny of "big business" and most of them have not yet sensed the full perils of the sort of tyranny that the socialist cult implies. They were generally college men.

They went to school when state socialism was a ruling cult in the universities. In the first years of this century the hard economic truths worked out, when the modern industrial system was getting under way, were in temporary eclipse. The teachings of the Manchester economists were in disrepute because of discrepancies in their system which had become apparent as the capitalist system of production had come to full flower. Even the teachings of the Neo-Darwinians and the results of the study of human heredity by Francis Galton were smothered by a wave of social sentimentalism. The work of Mendel with its crushing proof of the inequality of organisms including men and the supreme importance of the better-endowed individual was then practically unknown.

The German System Myth

SHALLOW optimism ruled in the schools. Teachers of economics were discounting the importance of individual initiative. Teachers of literature were daft about Ruskin, Carlyle and William Morris with their appeal to medievalism, the guild system and primitive village life and communal agriculture. German state socialism was held up as a model to backward Anglo-Saxondom. The public libraries are today stocked with books which told Americans in those days that the German municipality was the highest type of political organism that the human race had achieved.

Men assumed that institutions and laws were all that was wrong with the world. It was a backwash of the unscientific equalitarianism of the eighteenth century utopists and theorists of natural rights, who tried to start history all over again in the French Revolution and failed as signally as their Russian and East Side imitators have failed in our own time.

Malthus had vanished from the minds of men, banished by the marvelous increase in the productive power of industry conjured forth by free individualism and the rewards that nascent capitalism offered to brains. For a time his law seemed to have been repealed. Prices were low, interest rates were going down and the little wars were afar off on the edges of the pretty world. The limitations of human nature and the law of diminishing returns were alike forgotten.

The whole world rushed into a scramble of legisla-

Bringing New Light to the Blind

The Mission of a Unique Magazine

By R. P. CRAWFORD

THE strangest magazine in America is printed without ink, carries no advertising, costs the subscribers nothing, and has its postage refunded by the government. No ordinary person can read it, since instead of the customary black letters, there is only a system of little raised dots on the sheets of paper. Every number of the magazine is three times the bulk of an ordinary publication. This remarkable monthly is the *Matilda Ziegler Magazine for the Blind* printed (or should one say punched?) in a factory building in New York.

This is primarily a story of the blind, a story of those people who have lost their sight and are trying to make a measure of success in life. About one person in 1,200 in the United States is blind, and there are perhaps 90,000 blind persons in the country. The soldiers who were blinded in the war form but a very small fraction of the total, and they are provided for by the government. It is of the other blind that I write, many of them living in homes almost too poor to be called homes. What of their future, their livelihood, and their enjoyment of life?

One way they can be helped is by publications, but because of the cost of making books for the blind, there are very few. Another way is through lectures and the handling of objects, such as the American Museum of Natural History offers the blind. A third way—which is open to all—is by giving the blind an opportunity to get out into the open, to attend a concert or anything that will take their minds off themselves.

Years ago Mrs. Ziegler caught an idea of what a unique magazine for the blind would mean. For several years she gave enough money each year to publish it and later arranged an endowment so that it could be published perpetually. Today this is practically the only magazine for the blind in America that is supplied with standard reading matter. There are a few religious and school publications, but they are somewhat limited as to their contents. The cost of such publishing is evident from the fact that the Bible published for the blind costs $50 and an ordinary novel $10 to $15. The *Ziegler Magazine* introduced an innovation in America when it began to print on both sides of the paper, which had not been done before on this side the Atlantic. This effects a tremendous saving in paper.

Many may wonder how those deprived of sight can read a magazine. Sightless persons have a wonderful sense of touch. Walter G. Holmes, the editor of the *Ziegler Magazine*, mentioned a woman who can tell the denominations of paper money by feeling the ink in which the figures are printed. This is the principle of publications for the blind. They are read by touch.

There are little rows of raised dots across the manila paper and each group of dots represents a letter. Formerly, raised letters were used, but it was found that the blind could learn to read by the dot system more readily, and also use the same system themselves in writing to other sightless persons. There are two systems of dot letters in use among the blind of the country, and the *Ziegler Magazine* prints an edition in each system. A little space two dots wide and three deep in the Braille system is sufficient in which to form any letter of the alphabet. Here, for instance, is the word "cat," spelled out in the Revised Braille system of dots:

c a t

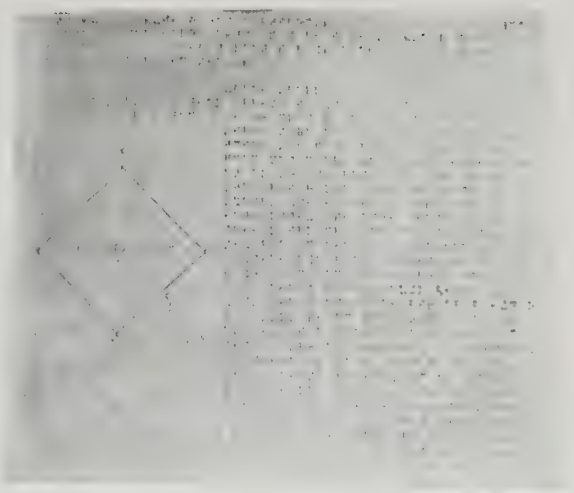
The blind can easily read by this system, once they have learned the system of dots, grasping the significance of the raised dots with their finger tips almost as easily as one reads printed letters with the eye.

A publishing house for the blind is really a unique institution. Type, of course, is not used to print the magazine. First, the respective dot letters are cut into large metal plates. A sort of "typesetting" machine is used for this purpose, having only a half dozen or so keys, which by combination form any letter of the blind alphabet. This machine simply punches the tiny dot-like depressions in the metal plate. A blind girl reads the proof of the page. When a plate is finished it is fastened on the cylinder press. The heavy manila paper on which the magazine is printed runs through the press between two sets of such plates, receiving an embossing on each side. To a person who sees the pages of the magazine with the eye, they appear to be afflicted with a sort of typographical smallpox, but the blind person feels only the upraised dots and does not notice the depressions that make the dots on the other side of the sheet. In fact, this plan of printing on both sides of the paper was one of the best things ever introduced in publication work for the blind.

Even as it is, the magazine is heavy enough, with some 56 pages of very heavy manila wrapping paper of about 11 by 14 inches in each issue. It formerly was the theory that blind persons could be expected to be interested only in the future life, since they were supposed to have nothing to live for here, and consequently numerous publications were of a religious nature.

"It reminds me of the time I took my blind brother to visit an old friend of the family," Mr. Holmes explained. "This lady thought she had to say something consoling, and so she exclaimed, 'Oh, James, you ought to be so thankful that you are blind; there are so many wicked things in this world that you cannot see.' And James at once replied, 'Well, Cousin Sarah, there are a lot of them that I would at least like to chance one eye on.' We have tried to get away from the mournful idea and publish a magazine just like any other."

A glimpse at one number of the magazine discloses among other things a "Publisher's Chat," a discussion of current events, an article on the Japanese question, a fiction story, a number of poems, an inspirational article, an editorial by Dr. Frank Crane, a list of recent deaths of blind persons, a liberal amount of humor, and most important of all, a page of "Experience and Suggestions." This is perhaps the most important feature in the magazine, since blind persons themselves write the material, telling how they are making a success of life. This page is to them what the stories of big business are to the average inspirational magazine reader. There are now several hundred blind in this country who learned to make a living through reading on this page what others were doing.



(C) American Museum of Natural History

Above—The American Museum of Natural History has a large supply of models illustrating various phases of the world's life. Here the children are studying methods of transportation. Below—Blind children study the world's geography by means of these globes, which have been specially designed for the purpose by the American Museum of Natural History.

There are, of course, no illustrations, as the average reader knows illustrations, since they can scarcely be reproduced in a raised form that a blind person could comprehend, but there are numerous diagrams and maps. For instance, there have been maps of the new European countries, and diagrams showing how baseball is played. During the war there were diagrams showing how the Big Bertha shelled Paris, diagrams of submarines, airplanes, and the like. These diagrams have to be very carefully executed on the metal plates, the design usually being traced first, before the dots are punched into the plate.

The *Ziegler Magazine* goes to any blind person who asks for it and who can read either the Revised Braille or New York Point system of dot letters, in which the paper is printed. Many copies of the magazine are read and then mailed to blind persons in foreign countries, a special postage rate having been procured for that purpose. The government transports publications for the blind free of charge within the United States.

(C) American Photo Service

A page of Braille from Ziegler Magazine telling how the game of baseball is played. Many blind enjoy baseball, their friends telling them of the hits, home runs, and so on, as they are made.

Blind persons today often write letters to each other in the raised letter system. There are small typewriters provided for this purpose; and there are also little slates, as they are called, by which a blind person may preserve notes or write to other blind persons. These are about the size of a ruler, composed of two strips of metal, and with little spaces cut in the metal. A sheet of paper is slipped in between the two strips of metal. The blind person simply takes a little metal punch and punches out the dot system of letters in the spaces provided. Of course, there are many blind persons who operate ordinary typewriters in splendid fashion, since their touch is so accurate. There are some business concerns who employ sightless persons at this work, using dictaphone for dictation.

The fact is that blind persons want to be treated just like others. It is idleness rather than blindness that is their despair in most cases. Anything that can relieve the great inky blackness of perpetual night is a blessing.

"People often come to me and want to know what they can do to help the blinded soldiers," said Mr. Holmes. "I told one woman a good way to begin would be to hunt up some blind persons, the names of some of whom I would be glad to give her, and take them out for a walk. 'Why, what good would that do them?' the woman asked. Most persons do not realize that with the loss of their sight, the other senses of the blind are marvelously quickened. There is one girl working for us who is both deaf and blind. Her touch is developed to an unusually high degree. I can write in ordinary script with the end of my finger in her hand and she can comprehend it at once. My brother's hearing and perception are so acute that he can detect telephone poles when we are 6 to 10 feet away. Nearly all sightless persons sooner or later are able to detect obstacles in front of them. I have wondered if this came from an echo or a pressure of the atmosphere. I think it is the former, for I have often heard blind persons making a slight whistling sound when walking in unfamiliar places. They were 'sounding' to ascertain if anything was in front of them. I know a girl who is both deaf and blind who does not have this power."

"People seem to think that because a person cannot see he cannot enjoy anything. Let him touch the growing grass and the flowers and his sense of smell, being quickened, he will get a deeper fragrance from the flowers than you do. A blind person may never have seen, but he creates in his own mind his notions of color. My brother told me that red came to him as a shrill whistle and that green was like soft music."

One of the biggest undertakings to aid the blind has recently been engineered by the American Museum of Natural History. There is a regular course of lectures for adults and classes for children. Free car fare is supplied to those who are unable to pay it, and Boy Scouts accompany the blind to and from the museum. Instruction for the blind must of necessity be given mainly in lecture form, with models of various kinds for the blind to handle. The museum recently had made to order 15 globes of the world for use in teaching geography to the blind in the New York schools. These huge globes were made in heavy relief, so that a blind person can easily determine the different mountain ranges and rivers of the world.

Even the animals of the wilderness are studied. Small models are used, so that children may first get a general idea of the main characteristics of the animal and then they are permitted to feel the real stuffed animals in the museum. There are models of canoes, steam cars, sail and steam boats, and airplanes, so that a blind person with a minimum amount of effort may receive a correct idea of the larger objects themselves.

The most effective way by which persons of means can aid the blind, Mr. Holmes thinks, is by supplying money with which to make a set of plates of a book. That costs about $500, and then an unlimited number of copies can be run off. These books are read and then passed on to other blind persons.

Paid for Before First Service

By VEDA GROUP

EVEN if a congregation is neither large nor rich, it can build a commodious and modern church and pay for everything as it goes. The Walnut Street Church of Christ, at Sherman, in North Texas, has proved it. And the building illustrated herewith is the proof.

Costing $40,000, it was completely financed in one year by a congregation of less than 600—a congregation that had thought itself too poor even to provide a needed Sunday school room or two when the matter was first proposed.

Something had to be done about the Sunday school. It was entirely too cramped in the old quarters. Nothing was done, however, just then. But as the weeks sped along dissatisfaction grew with the location, as well as the cramped quarters, for the church occupied had been encroached on by industrial interests until its corner was one of the noisiest in town.

Then came the opportunity to buy a good lot, well located in a quieter section, for $4,000. The lot the congregation had, now commercially more valuable, would bring $6,500. So, disposing of the old church building for about $400, the congregation found itself possessed of a desirable lot and approximately $3,000 as a nucleus for its building fund.

Walnut Street Church of Christ, Sherman, Texas, entirely paid for before the first service was held within its walls.

A committee of seven was appointed to visit various towns and churches and see what sort of edifice it would choose if the congregation *did* have the money to back up its choice. The committee decided on a building that met requirements, and an architect was even employed to draft plans and specifications.

Then, because of economic conditions, the congregation let the matter drop for a time, arranging to meet in one of the public school buildings meanwhile. This arrangement lasted for a year. By that time an edifice of its own was more desired than ever. A subscription list was started. Several members headed it with as much as $3,000 each, and the remainder contributed according to their means. Enough money was in the treasury to start the work. The building was begun.

The structure was just one year in completion, but at each estimate furnished by those in charge, money was in the bank sufficient to meet it, and a little to spare.

Short-time subscriptions were called for, all pledges being on the basis of one year. The exact method adopted was akin to that of the Liberty bond campaigns, for a committee met and checked off the congregation into groups—those few who could pay $1,000 or more if necessity required; those who could pay $500 if necessary; those who could pay $100 within a year's time; those who might be looked to for less sums. But small sums total well in the aggregate, and this survey indicated a "capacity to pay" commensurate with the needed fund.

But the ultimate assessment was left entirely to the determination of the individual approached. Each shared, too, in planning as well as paying. The entire church membership was taken into all deliberations and had a voice in saying what should be done and how—and then in footing the bill for it; a bill of their own making.

And that new church building had become intensely desired. The proposed edifice as a finished whole was now constantly in their mind's eye. A man is rather apt to find that he can afford the things he wants very strongly; and this church that at first approach thought it could not even add Sunday school rooms in such hard times, determined that somehow it was going to afford even an entire new modern building.

Well begun was half done. The old lot advantageously exchanged for another and the old building disposed of, gave a nucleus for the new fund, and those with some ready money paid promptly on their assessments that the work might begin.

"We haven't any money right now," was the plea of others. "That's all right," responded the committee; "just tell us when you *will* have it and we'll be around." Usually an approximate date for payment could be promptly given.

A strict pay-as-you-go policy was adopted. When enough money was in hand to start operations, operations were begun. When one stage of the work was completed another call for funds was made. Collectors were courteously diligent in looking after contributions, and with the building steadily progressing before the eyes of the congregation the funds were forthcoming. There is an inspiration in growing things that stirs even the roots of the dollar. And when the last stone was laid, the last stroke given, and the doors were opened to the members of the congregation, they entered with not one cent of church debt overshadowing them. In fact, the final furnishings left $200 or $300 yet in the treasury.

It was with pardonable pride that the senior elder of the church, a man well past the allotted three score and ten, broke ground for this new structure. It was with pardonable pride that the edifice was dedicated, with money at that hour in the bank to fully complete its construction. And it was with most pardonable pride that the jubilant congregation filed into the pews for the first sermon in the new church, knowing that, small as they were in numbers, lacking as they had felt themselves to be in funds, they had adequately financed the project, with not one cent owing.

It was for more Sunday school room that the project was first begun. And in this neat brick building of two stories and basement, with main auditodium seating 800, steam-heated, provided with electric lights and fans, and furnished with convenient rest room, 14 Sunday school rooms are provided. This affords ample accommodations at present for more than 400 pupils. But with an increasing membership, an adult Bible class, numbering 100, and a church enrollment now 700 instead of 500, just how long the building will continue to be adequate is a question.

But all that was considered in the original plans—and when the question of addition comes up, doubtless the money will again be forthcoming.

Things in the Making

PERFUMERY

THIS is not a poetical age. The days of romance and verse have been supplanted by years of practical production along most unromantic lines.

And yet, perhaps, there is no occupation which is so poetical in its surroundings as that of the perfumer. Groves of oranges and lemons give him of their buds; acres of flowers bloom for him; fields of violets, roses, verbenas, lilies, the jasmine, tuberose, hyacinth, jonquil await his call.

These flowers are gathered, each in its season, always at nightfall, or at early dawn, while the dew is still on them.

They are brought in large hampers, and piled handful by handful on a frame, over which has previously been stretched a cloth which has been moistened with odorless olive or almond oil.

When this frame is filled with the flowers, heaped on it, another is fitted over it, and that in turn is heaped with the fragrant blossoms. This fitting and heaping is continued until frame after frame is used, and a ponderous pile is prepared.

This is left for two days, and then fresh flowers are used to replace the first. This process is repeated every two days for a fortnight.

At the end of this time, the last flowers are removed, the cloths taken from the frames, and the oil with which they were moistened is wrung from them under great pressure.

This is found to be heavily and deliciously charged with the aroma of the flowers used.

This oil forms the base of all perfumery, and is used in greater or less degree, as a certain strength is desired.

To make the finest extracts, the oil is used with double its weight of pure rectified spirit, in a vessel known among cooks as a digester. This digester is a porcelain or block tin kettle that fits inside another kettle, the outer one being filled with boiling water.

In this vessel the contents digest for three or four days, being frequently severely shaken. Then, having been set to cool, the spirit is decanted into another vessel holding the same quantity of the perfumed oil, and the process is repeated.

After a third repetition of the process, the spirit has taken up enough of the perfume, and it is then carefully decanted from the oil, for the last time, through a tube, one end of which has been filled with cotton wool.

The product thus obtained is pronounced to be the choicest extract known, usually called "triple-extract," possessing an exquisite delicacy that belongs to no other preparation.

The extract is now bottled, labeled and packed, and is ready to be shipped.

How Propagandists Impose on the American People

Concluded from page 8

tion and bureaucratic regimentation was to make over the race and inaugurate the Kingdom of Heaven right away.

Twenty years before, Herbert Spencer had predicted that orgy of state mania, but his was a voice crying in the wilderness while mankind was disporting in the rose gardens of Utopia.

We are paying rather dearly today for those cheerful hallucinations. It is not only the war that has produced our morning after. The state socialism that accompanied and followed it must be charged with no small part of the price of the jag. One reason why politicians bribed some men to work while they forced others to fight was the worship of the state fetish, which made their course seem the natural thing to do. Nowhere are we paying more dearly for the miseducation of those easy, credulous times than in our news output. The aftermath of the state socialist wave can be traced every day in news and editorials.

The younger men in the newspaper game—the cubs today who will be the editors and staff correspondents tomorrow—are not so much better off. The schools are still shot through and through with the virus of state socialism. The percentage of radicals, or the milkier type who pirate the grand old name of "liberal," in the staffs of the high and elementary schools is still very high. The apparently obvious and rule-of-thumb propositions of the socialist cult are peculiarly adapted to the pedagogue mind, which deals with abstractions and exactitudes rather than with life and the elusive factors of human nature and psychology.

The principal circulation of the parlor "pink" periodicals, outside the metropolitan centers, is among school teachers. This can be verified at any news stand, which sells those high-brow weeklies which are always so cocksure about the future, apparently because they have been mistaken about everything they predicted in the past.

To picture adequately the influences playing upon the daily news product it is necessary to take a brief glance at the more active propagandist elements.

Every city has its "little group of serious thinkers," to appropriate Don Marquis' inimitable characterization.

These include many newspaper men and women—not the more active type of workers it is true—but the hangers-on, the critics, the department editors—the high-brow esthetic fringe.

The "little groups" and their allies exercise pressure in divers ways. Their zeal for the cause is reinforced by an intense hunger for personal publicity.

Sometimes this pressure comes through the churches, despite the usual supercilious attitude of the "intelligentsia" toward those institutions. A great many ministers, and still more of the denominational officials and attachés of the mission boards seem to have interpreted their Christianity into a new cult with little left in it but nebulous ideals of "social service."

The tender regard manifested by some of these advanced clergymen and social workers for individuals of the Haywood and Mooney type, their continual attacks on "mammon"—meaning the hard-worked business executive who usually has to pay for the clerical socialist jazz parties—and their solicitude about the conscientious objectors and the "political prisoners" reveal pretty clearly their intimate kinship with the rest of the communist clan.

Nevertheless they do not scruple to employ the prestige of their clerical positions to secure publicity for their various "surveys" and reports on industrial conditions and strikes. Many of these "surveys" have been compiled in part by men who are to all intents and purposes opposed to every institution that the mass of church members cherish, but they are trumpeted forth as the judgment of the Christian community.

One of these reports prepared on a traction strike in a western city was so inaccurate that it was withdrawn after a part of the preliminary proofs had been printed by the newspapers. Its inaccuracy was admitted to a critical editor by the clerical sponsor of this "survey." No public admission was ever made by him, however.

The pressure of the clerical socialists is only one of many methods employed by the "little groups" and the other cohorts of "sweetness and light" to influence the newspaper worker. More often the social lure is used, and observers in Washington have asserted that instances are not unknown when the sex lure has been employed.

There is always a piquant and attractive attempt to create an atmosphere of Bohemia among the "little groupers." In Washington there are several of these little circles of the elect. A new correspondent arriving in the capital is very likely to be sought out. Unless he is unusually "hard boiled" or parochial he is very likely to fall in line eagerly and gracefully and begin sending the proper stuff back to the home-town papers.

The Commandments of the Bible on Interest

Jesus' Order That None Be Charged Ruled for 1,000 Years, But Command Is Suppressed in English Translation of Bible

By DU BOIS H. LOUX, D. D.

IT IS a matter of history, now kept in the background and never mentioned, that a single commandment from the lips of Jesus Christ ruled Christendom for more than one thousand years.

Some time before the English translation of the Bible, now in general use, was accomplished, a discreet silence began to be practiced with regard to this commandment.

The commanding word of Christ thus suppressed through the medium of the English tongue stands in three syllables in the Greek original of the New Testament—*daneizo*. It is the word translated "lend."

On coming to this word, you look it up in the *Greek and English Lexicon* of the New Testament prepared by Professor Edward Robinson, D. D., LL. D., of Union Theological Seminary, New York, a publication by Harper & Brothers, New York.

The lexicon tells you: *"dancizo,* future *eiso* (daneion) to lend money, *to loan,* in New Testament, *without interest."*

Jesus Christ gripped the conscience of Christendom with this word for more than a thousand years.

It is in the sixth chapter of Luke at the 35th verse, that his injunction stands: *"Lend without interest, never despairing."*

Paraphrased, as the word "despairing" requires, this commandment reads:

"Lend without interest, never taking away the hope of the world, and never doubting that God will reward your obedience."

"Hope of World" Statement Muddled

THIS paraphrase is due to Jesus' imperative, as it is expressed in the Greek, "never taking away hope."

The King James "authorized" version of the Bible, which we now use, for the most part, in our churches, completely muddles the Old Testament statement of *the hope of the world.* You will not find the Bible that we use in the churches giving *the hope of the world* with the simple grandeur of the thought with which it is clothed in the original. The American version preserves this grandeur:

"HOWBEIT, THERE SHALL BE NO POOR WITH THEE . . . . IF ONLY THOU DILIGENTLY HEARKEN UNTO THE VOICE OF JEHOVAH THY GOD, TO OBSERVE TO DO ALL THIS COMMANDMENT WHICH I COMMAND THEE THIS DAY." (Det. 15:4-6.)

Jesus, conscious that He spoke for all time for the claim of this hope upon the world, put Himself squarely on record as having come with the commission to enforce this hope:

"Think not that I came to destroy the law or the prophets; I came not to destroy but to fulfill. For verily I say unto you, Till heaven and earth pass away, one jot or one tittle shall in no wise pass from the law, till all things be accomplished. Whosoever therefore shall break one of these least commandments, and shall teach men so, shall be called least in the kingdom of heaven: but whosoever shall do and teach them, he shall be called great in the kingdom of heaven. For I say unto you, that except your righteousness shall exceed the righteousness of the Scribes and Pharisees, ye shall in no wise enter into the kingdom of heaven." (Mt. 5:17-20.)

In other words, Jesus authoritatively forbade interest, and forbade other injurious practices, on the ground that he was introducing no innovation, but was standing firmly on the commandments of the Old Testament, which expressed in His clear judgment, God's faithfulness to His creation.

It should be observed that Jesus took His stand against interest from the first. In this particular He is in contrast with Nehemiah, who, as governor of the Jews after the Exile, took the stand only after he had proof that the most well-meaning people could not prevent poverty in a society that exacts interest.

Nehemiah's Outcry Against Interest

NEHEMIAH'S story of his conversion as a leader of the people to God's commandments against interest, is even thrilling, if we keep in mind the thought of Christ's clear record from the outset of the "glad tidings" (i. e. *gospel*) which he proclaimed for the world. Nehemiah writes:

"There arose a great cry of the people and of their wives against their brethren the Jews . . . . We are mortgaging our fields, and our vineyards, and our houses. . . . We have borrowed money for the king's tribute, upon our fields and our vineyards. Yet now our flesh is as the flesh of our brethren, our children as their children: and lo, we bring into bondage our sons and our daughters to be servants, and some of our daughters are brought into bondage already; neither is it in our power to help it; for other men have our fields and our vineyards.

"And I was very angry, when I heard these words. Then I consulted with myself, and contended with the nobles and the rulers, and said unto them, *Ye exact interest* (original text), every man of his brother. And I held a great assemblage against them. And I said unto them, We after our ability have redeemed our brethren the Jews that were sold unto the nations; and ye would even sell your brethren, and should they be sold unto us? Then they held their peace, and found never a word. Also I said, The thing that ye do is not good *ought ye not to walk in the fear of our God,* because of the reproach of the nations our enemies? And I likewise, my brethren and my servants, *do exact of them money interest and interest of corn* (original text). *I pray you, let us leave off this interest.* Restore, I pray you to them, even this day, their fields, their vineyards, their oliveyards, and their houses, also the hundredth part of their money, and of the grain, the new wine, and the oil, that ye exact of them. Then said they, We will restore them, and will require nothing of them; so will we do, even as thou sayest. Then I called the priests, and took an oath of them, that they would do according to this promise. Also I shook out my lap, and said, So God shake out every man from his house, and from his labor, that performeth not this promise; even be he shaken out, and emptied. And all the assembly said, Amen, *and praised Jehovah.* And the people did according to this promise." (Neh. 5:1 ff.)

The Hebrew words for interest, as they are found in the Bible, are very illuminative. They convey to us the word-picture of the fact that interest is an *"exaction,"* a *"bite."*

I must repeat that this vivid portrayal by Nehemiah of the fact that interest makes for poverty, was within the clear grasp of Jesus from the beginning. His interdiction of interest, as paraphrased, *Lend without interest, never taking away the hope of the world, and never doubting that God will reward your obedience,* blazed its way through Christendom, until the "authorized version" of the Bible began to cloud the issue.

Just now it is our part to hold our breath, while we give audience to the word of God against interest, which, to preserve Jesus' figure of speech, has been systematically "hid in a napkin" from our intelligence. You will find that the American Revised Version, unless otherwise noted, faithfully records the exact words of the original text.

"Thou hast taken interest and increase, and thou hast greedily gained of thy neighbors by oppression, and hast forgotten me, saith the Lord Jehovah. Behold, therefore, I have smitten my hand at thy dishonest gain which thou hast made." (Ezek. 22:12 ff.)

"If a man be just, and do that which is lawful and right . . . . and hath not wronged any . . . . he that hath not given forth upon interest, neither hath taken any increase, that hath withdrawn his hand from iniquity, hath executed true justice between man and man, hath walked in my statutes, and hath kept mine ordinances, to deal truly; he is just, he shall surely live, saith the Lord Jehovah.

"If he beget a son that is a robber . . . .and that doeth any one of these things . . . .hath wronged the poor and needy. . . .hath given forth upon interest, and hath taken increase; shall he then live? He shall not live; he hath done all these abominations; he shall surely die; his blood shall be upon him.

An Old Testament Warning

"NOW, lo, if he beget a son . . . . that hath withdrawn his hand from the poor, that hath not received interest nor increase, hath executed mine ordinances, hath walked in my statutes; he shall not die for the iniquity of his father, he shall surely live.

"Yet saith the house of Israel, The way of the Lord is not equal. O house of Israel, are not my ways equal? are not your ways unequal? Therefore I will judge you, O house of Israel, every one according to his ways, saith the Lord Jehovah. Return ye, and turn yourselves from all your transgressions; so iniquity shall not be your ruin. Cast away from you all your transgressions, wherein ye have transgressed; and make you a new heart and a new spirit: for why will ye die, O house of Israel? For I have no pleasure in the death of him that dieth, saith the Lord Jehovah; wherefore turn yourselves and live." (Ezek. 18:5-32).

The word to Ezekiel himself concerning this message, that it be surely delivered, is not unimportant:

"Son of man, I have made thee a watchman unto the house of Israel: therefore hear the word at my mouth, and give them warning from me," is the prelude to the most signal warning in the Old Testament. The Bible closes with a similar warning. (Ezek. 3:17-21; Revelation 22:13-19.)

You will find that interest is invariably associated with "abominations," and with intimations that it is in no small part responsible for the sins and injustices of life.

The fifteenth psalm is an antiphonal exercise that comes to a climax in its note condemning interest:

> "Jehovah, who shall sojourn in thy tabernacle?
> Who shall dwell in thy holy hill?
> He that walketh uprightly, and worketh righteousness,
> And speaketh truth in his heart;
> He that slandereth not with his tongue,
> Nor doeth evil to his friend,
> Nor taketh up a reproach against his neighbor;
> In whose eyes a reprobate is despised.
> . . . . . .
> *He that putteth not out his money to interest,*
> Nor taketh reward against the innocent."

In another psalm, the sense is given by implication, that the interest exactor is a "son of wickedness."

> "I have laid help upon one that is mighty;
> I have exalted one chosen out of the people.
> . . . . . .
> The enemy shall not exact interest from him (original text),
> Nor the son of wickedness afflict him." (89:19-22.)

This is a prophecy, it has been thought, of the one who is destined to arise to do mighty service for relieving the world of the curse of interest.

There is a graphic picture of the opposite situation in the story of Elisha, the prophet: "Now there cried a certain woman of the wives of the sons of the prophets unto Elisha, saying, the interest exactor (original text, the word meaning the man who takes the interest *bite*) is come to take unto him my two children to be bondmen." (2 Kings 4:1-2)

The irony of God, if we may use the expression, is poured forth over the situation, when Israel, the transgressor of the law against interest, is pictured as having fallen into the hands of God's "interest exactors": "Thus, saith Jehovah, Where is the bill of your mother's divorcement, wherewith I have put her away? or which of my *interest exactors* is it to whom I have sold you? Behold, for your iniquities were ye sold, and for your transgressions was your mother put away." (Isa. 50:1-2.)

Interest as a Desolation Breeder

IN ANOTHER place, Isaiah brings in the interest-taker as central to the picture of desolation that is to befall Israel: "Behold, Jehovah maketh the earth empty, and maketh it waste, and turneth it upside down, and scattereth abroad the inhabitants thereof. And it shall be, as with the people, so with the priest; as with the servant, so with the master; as with the maid, so with her mistress; as with the buyer, so with the seller; as with the *interest-exactor,* so with the debtors, as with the *taker of interest,* so with the *giver of interest* to him. The earth shall be utterly emptied, and utterly laid waste; for Jehovah hath spoken this word. The earth mourneth and fadeth away, the lofty people of the earth do languish. The earth also is polluted under the inhabitants thereof; because they have transgressed the laws, violated the statutes, broken the everlasting covenant." (Isa. 24:1-5.)

Solomon's word was being fulfilled as concerned the presumptuous nation, "He that augmenteth his substance by *interest* and increase, gathereth it for him that hath pity on the poor." (Pro. 28:8-10.)

The law against interest reads: "If thou lend money to any of my people that is poor, thou shalt not be to him as an interest-exactor; neither shall ye lay upon him interest." (Ex. 23:25.)

It remains for us to see how Moses weaved the interest commandment into the basic law from which all commandments radiate. With a single inspired stroke, he is shown in the process of communicating, at once the basic law, and the very practical suggestions as to how to start a movement in an interest-cursed world to realize the ideal for society that is expressed in the basic law. Again elevating the fundamental law with capitals, the law and the suggested remedy stand in brilliant relief against the world custom:

It Was Against the Law

"AT THE end of every seven years thou shalt make a release. And this is the manner of the release: every interest-taker shall release that which he hath lent unto his neighbor: he shall not exact it of his neighbor and his brother; because Jehovah's release hath been proclaimed. Of a foreigner thou mayest exact it: but whatsoever of thine is with thy brother thy hand shall release. *Howbeit, there shall be no poor with thee (for Jehovah will surely bless thee in the land which Jehovah thy God giveth thee for an inheritance to possess it), if only thou diligently hearken unto the voice of Jehovah thy God, to observe to do all this commandment which I command thee this day."* (Det. 15:1-6.)

You have detected a new note in the statement of the interest law. This note is sounded once more in Deuteronomy (23:19-20): "Thou shalt not lend upon interest to thy brother; interest of money, interest of victuals, interest of anything that is lent upon interest. Unto a foreigner thou mayest lend upon interest; but unto thy brother thou shalt not lend upon interest, that Jehovah thy God may bless thee in all that thou puttest thy hand unto, in the land whither thou goest in to possess it."

There is no surrender of principle in the new note. The note is addressed to Israel as a nation. It is penal in character. The nation may do, for the protection of its people, what it is not lawful and neighborly for the people to do among themselves. The punishing hand of interest, when visited by a nation of the consummate business genius of the Jews on the people of any other nation in their entirety, would act to bring that nation to its senses. Foreign peoples would gather from the prosperity of Israel that it was due to what Nehemiah called "the leaving off" of interest. A nation with no poor within its borders would constitute a standing proclamation of the wisdom and the goodness of the Almighty.

A Historian of the West

William E. Connelley Writes True to Life

By FRANK M. CHASE

WILLIAM ELSEY CONNELLEY

THE West of America has a history as well as the East. Possibly there is not so much of it, and perhaps it doesn't figure quite so largely in the textbooks as it should, but it is no less romantic. And it is being written. One of the recorders of it is William Elsey Connelley, whose work in this field constitutes a valuable addition to historical literature.

Since boyhood he has assiduously gathered the lore of the early western life, preserving it and putting much of it into readable form. Throughout his writings, too, is an admirable lifelikeness. Real flesh-and-blood people are presented to the reader, instead of mere names. To read his books, or to talk with him about the remote days of which he writes, is to glimpse a succession of heroic figures stepping out of the past, and to learn of colorful incidents in the building of our nation that afford the ideas for a thousand tales; for, running deep in Mr. Connelley's make-up, is the spirit of the romanticist, with an eye ever alert to the picturesque in man's achievement. With the life of the pioneers his pen also deals sympathetically, due in no small part to his own rugged personality developed by a life not without its trials.

Mr. Connelley was born in a log cabin in Johnson County, Kentucky, March 15, 1855, and was the oldest of five children. When he was but seven years old, his mother died. This, of course, was in the second year of the Civil War, in which his father was serving with the Union Army. The family was poor and the children, with neither parent to look out for them, were left to the care of neighbors and relatives in a district that came often to feel the physical effects of its proximity to battle. More than once was the young William beaten by passing guerrillas, while the general disruption and poverty of the community made it anything but favorable to the welfare of childhood.

His Early Thirst for Knowledge

WOUNDED, the father came back to his children incapacitated for the labor of his farm, and turned to the making of shoes. To help out with the family expenses, William also learned the shoemaker's trade in his father's shop. This, like the other shops of its kind and time, was a gathering place for men, many of them being ex-soldiers, and here the impressionable boy heard much discussion of the affairs of state and nation. From this daily contact with maturer minds he came early to appreciate the value of knowledge, and the taste of it he was receiving whetted his desire for more.

But with filling a breadwinner's place, and with the meager school facilities at hand, there was little opportunity to acquire a formal education; altogether he never attended school more than one year. His zeal to learn, however, did not abate, and he so read and studied by himself that, beginning in 1872, or when only 17 years old, he taught school in Johnson County, continuing to teach eight years. That the obstacles in his path did not prevent him from obtaining an education is evidenced by the fact that in 1911, in recognition of his services as a historian, Baker University granted him the honorary degree of Master of Arts.

In 1881 he went to Kansas, this move having resulted from several early influences. His mother was a fervent believer in the cause of the North, even impelling her husband to support Lincoln for the presidency against his own inclinations and sympathies; and, though she died while William was still a child, her cloudless vision of right left its impress on the young mind. Doubtless the conversations which the boy, working at the last in his father's shop, heard about the strategic rôle of Kansas in bringing the slavery question to a head also had their effect. Coupled with these subtle influences was his own imaginative nature, which urged him to seek opportunity in a region thus tinged with adventure.

On his arrival at a small town in the eastern part of the state the rainy night of April 22, 1881, he had 60 cents. The bulk of this he spent for lodging for himself and his brother, who accompanied him. In the morning the two young men set out breakfastless to make their way in a strange land. With their few remaining pennies they bought a loaf of bread and a piece of bologna at the village grocery.

At Kansas City, on the payment of the required fee, they had been directed to a farmer living near the town where they left the train, who was said to be in need of help. Despite the mud and rain, the Connelleys set out afoot for this place, though on arriving there they were informed that he could use no more men. The proprietor, however, referred them to some of his neighbors, and before nightfall the two young adventurers were working on farms not far apart.

In the autumn, William took charge of a rural school at a salary of $45 a month, teaching for one year. Meanwhile he became acquainted with the county clerk who, ambitious to be re-elected, desired Connelley to look out for his interests at the county convention. Connelley accepted the task, doing it so well that his friend was again nominated and later re-elected. He was then taken into the county clerk's office as the deputy clerk, serving in this capacity two years. He himself was then elected county clerk, and served two terms. The wholesale lumber business at Springfield, Missouri, next received his attention for several years, after which he was connected with the banking interests of Kansas City, Kansas.

In August, 1903, he entered the business of oil production at Chanute, Kansas. Here he figured in a part of the nation's record which numbers of others have set down, for it was while engaged in this work, and largely due to his efforts, that the crusade against the Standard Oil Company for alleged unfair practices began and which resulted in the dissolution of that corporation by the United States Supreme Court.

Always a passion with him, the study of history held a new interest for Connelley on his arrival in Kansas, especially as he realized that much of the early record of the state would be lost unless immediate attention was given to preserving it. Accordingly he at once set about collecting material concerning it, a task from which he has never relaxed so long as a trail to reliable information was known to him.

He Hunted Long for Wyandot Lore

NOW, the Indians having most to do with the primitive history of this region were the remarkable Wyandot tribe. They were the originators of the Northwestern Confederacy, which came into existence in 1750, and which fought stubbornly for years to make the Ohio River a boundary between the United States and Canada. They also were the leaders and preservers of this league, the council fire of the Confederacy always burning in their chief village. In 1843 the Wyandots came westward from Upper Sandusky, Ohio, settling in the fork of the Missouri and Kansas rivers, at the point where Kansas City, Kansas, now stands. With them they brought a constitutional form of civil government, which they put in operation soon after their arrival, this being the first government under a constitution in what later became the state of Kansas. As a tribe these forward-looking Wyandots also favored the organization of the Nebraska (then known as Kansas) Territory; taking, indeed, by the establishment of a provisional government in 1853, the first effective step to this end.

To Connelley the story of this self-government by Indians had an irresistible appeal, and on learning of it he began to collect the original documents having to do with it. Many of these he obtained during his residence at Kansas City, Kansas, where he had the confidence of numerous prominent Wyandot families which, desirous of having the papers preserved, greatly aided him in the work. Family by family and person by person he sought information on the subject, going also to Indian Territory (now Oklahoma), where the bulk of the remaining Wyandots were then living, in his search. Several of the most desired documents turned up after a hunt of 15 years in both Wyandotte County and Indian Territory, while others, the quest revealed, had been destroyed. Finally, however, further search seeming of no avail, the Nebraska State Historical Society in 1899 published his first book, "The Provisional Government of Nebraska Territory." In it, besides the author's historical review, are all the early documents of value that he could obtain, including the charming journals of William Walker, the provisional governor, who, as Connelley wrote, was "a Wyandot Indian, a gentleman of education, refinement, and great strength of character."

Indians Make Him a Chief

CONNELLEY himself is an adopted Wyandot, raised up to fill the position of the famous chief known to history as the Half King. Half King was chief of the Wyandots during the Revolutionary War, and one of the founders of the Northwestern Confederacy. He was a member of the Deer Clan, and was the Sahr-stahr-rah-tseh of the tribe. His Indian name was Tooh-dah-reh-zhooh, meaning the greatest deer, or the Deer That Leads the Herd. He died in Detroit in July, 1788.

Mr. Connelley also bears the Wyandot name of Deh-hehn-yahn-teh, The Rainbow, and frequently has transacted business for this people. In the course of these duties, as well as while gathering the documents referred to previously, he became much interested in the Wyandot language, history, manners, customs and religious beliefs. This led him to write an account of the clan system and other features of tribal society, and his publishing of "Wyandot Folk Lore" in 1899.

"Twenty years ago, seeing that no collection of the folk lore of this interesting people had ever been attempted," he says in this volume, "I began to gather and record such of it as I could find. Most of it had then been lost by the tribe. This will not seem strange when it is known that Wyandots were even at that time of more than one-half white blood. There is not so much as a half blood Wyandot now living. The last full blood Wyandot died in Canada about 1820. I began the work at a most fortunate time. There were then living many very old Wyandots who remembered much of their tribal history and folk lore. These are now dead, with but a single exception. The generation now living could furnish no folk lore of value. Few of them speak their language. Not half a dozen can speak the pure Wyandot. Their reservation near Seneca, Missouri, is not different from the well-tilled portions of our country. They are good farmers, and have schools and churches. Stih-yeh-stah, or Captain Bull-Head, was the last pagan Wyandot; he died in Wyandotte County, Kansas, about the year 1860."

North America "The Great Island"

CONCERNING the legends of the Wyandots, he says: "The Wyandots had a beautiful mythology. The creation of the world and everything in it was accounted for in their myths. The Great Island, as North America was called by them, was supposed to be borne up by a great turtle. The island was peopled by the Twins born of the Woman who fell down from Heaven. These twins were gods; they went to war, and one slew the other. The Singing Maidens, Why the Autumnal Forests Are Many-Colored, and other myths of the Wyandots are very fine specimens of pagan poetry."

Mr. Connelley has a very extensive vocabulary of the Wyandot language, the only one to be prepared, and a collection of the songs which missionaries and others rendered into this tongue. His translation of the Lord's Prayer into Wyandot also is the only one known to exist. This was the work of years, as the original contained so many ideas alien to the ancient Wyandot mind that much patient study and research were required to find adequate expression of them in the Wyandot language.

The pivotal position of Kansas with reference to the slavery question has made the history of the state especially interesting from a national, as well as a local, point of view. Also, out of the division over this question and the events incident to this and the formation of the state, arose a number of striking figures. Among them were John Brown, of Osawatomie and Harper's Ferry note; James Henry Lane, the "grim chieftain of Kansas"; Preston B. Plumb, an illustrious United States Senator; and John J. Ingalls, the famous orator and author of the poem "Opportunity." Realizing the place of these men in national, as well as in Kansas history, Connelley has written the lives of each of them. He is also the author of "Kansas Territorial Governors," "Doniphan's Expedition," and "Quantril and the Border Wars."

Realizing a Boyhood Ambition

TO OBTAIN the material for these works, while getting much of it from original sources, Mr. Connelley naturally made much use of the facilities of the Kansas State Historical Society, of which he is a very active member. Meanwhile his abilities and services as a historian became so recognized that in 1914 he was chosen secretary of the society. In this position, which he still occupies, he has found time to continue his writing. In 1917 he published a five-volume "History of Kansas." A few years earlier he published "Eastern Kentucky Papers," dealing with his native region. He is now engaged in writing a history of Kentucky. To write this history has been his ambition since boyhood, having collected material for it during more than 40 years.

William Connelley is a man of strong personality and great determination to accomplish whatever he sets out to do. Though always cherishing an ambition to write history, to do so has meant a struggle for him; for this is a work that means long labors before there is even a meager return, and meanwhile a living had to be made at other occupations. Connelley, however, has managed to keep himself free from dictation and has written history impartially.

Through his work, he has made friends with many men of note, among them the statesmen and literary leaders of Kansas and other states. While engaged in some special investigational work in the office of the Indian Commissioner at Washington, during the Roosevelt Administration, he became acquainted with the President, whom he visited many times. Roosevelt expressed great interest in the people of Eastern Kentucky, about whom Connelley knows a great deal, and often remained up late at night to hear about them.

By the Connelley method of handling it, history is made human; becoming something not abstract and difficult, to be taken as a mental gymnastic, but a romantic record of life. He is deeply conscious, nevertheless, of the great purpose of history.

The Texas Rangers—a Picturesque Body of Fighters

Their History Replete With Daring Deeds

By ROBERT H. MOULTON

A Texas Ranger, showing equipment carried when on active duty.

CANADA has its Royal Northwest Mounted Police, whose fame is secure in English-speaking countries and most of the other civilized lands where stories of grit and daring and coolness in the face of great dangers are appreciated. There is another body of picturesque men, whose organization is older and whose history teems with brilliant exploits and daring achievements in the discharge of their duties, but whose fame is not so well known.

The organization referred to is the Texas Rangers. The exact date of the origin of the rangers is lost in the obscurity of early Texas history, but it was at least as early as 1835. When Texas revolted from Mexico, in 1835, a general council met, and, as a part of its work, authorized the first ranger force. This organization was to consist of three companies of 25 men each, one to range east of the Trinity River, one between the Trinity and Brazos rivers, and the third between the Brazos and the Colorado. The men were to serve solely as protection against the Indians, the remuneration being $1.25 a day. These early rangers were semi-military in character, varied in formation, ununiformed, and irregular in operations. They were, in a sense, indigenous to Texas, having sprung from the soil on which their kinsmen shed their blood, and they soon became the frontier fighting force par excellence of the world. They were the forerunners of such organizations as the Northwest Mounted Police, of Canada; the Cape, of South Africa, and the Pennsylvania State, though unlike any of them. They were the Anglo-American solution of the problem of the frontier. The true character of the rangers becomes clear only in the light of that knowledge which comes from an acquaintanceship with the nature and disposition of their foes, the Mexicans on the one hand and the Indians on the other.

From long experience with the Mexicans, the Texans had come to distrust every word and deed of the race. They doubted their honor, feared their mercy, and despised their valor—lessons dearly learned at the Alamo, Golidada and San Jacinto. From the Indians, whose position extended along the edge of the great prairie from the Rio Grande to the Red River, a distance of 500 miles, they also took hard lessons. The Comanche warrior was a terrible foe, courageous, cunning and cruel, an adept in all the practices and subterfuges of partisan warfare, and to meet him the ranger had to adopt his tactics. For example, the Comanches always came suddenly, mounted on the fleet prairie mustangs, which they managed with consummate skill, and which bore them away with the speed of the wind. Again, the Comanches never permitted themselves to be made captive, and to become their prisoner meant torture and death. Here were the ready-made rules by which the rangers had to fight. They were of necessity superb horsemen, using their legs mostly for mounting and sticking on. They were sure marksmen, showing great preference for the revolving six-shooter. They were versed in woodcraft and possessed an uncanny sense of direction, and they knew the lore of the forest as well as that of the plain. Colonel John S. Ford, himself a ranger, soldier and newspaper man, summed up their qualities in these words: "The Texas Ranger can ride like a Mexican, trail like an Indian, shoot like a Tennessean, and fight like a very devil."

Above all, these frontiersmen were the embodiment of individualism. It was their outstanding trait, their chief characteristic. They were self-reliant and resourceful, frequently extricating themselves from difficulties, not by fighting but by quick thinking. Only one thing in warfare they had forgotten in their long struggle with a dual foe, and that was to surrender. They gave quarter—sometimes—but never asked and never expected it. Their leaders were natural leaders, men who possessed in a high degree the qualities they admired in others and found essential to themselves. The ranks were filled with those courageous ones who loved action and adventure better than ease and gain.

In 1845, Texas joined the Union. The Mexican War followed immediately, during which the rangers performed such valiant service as scouts and guerrilla fighters with the armies of Taylor and Scott that they were heralded as heroes throughout the nation. In 1874 the rangers were reorganized, six companies of 75 men each. But an important change was made in their status and duties. They were to protect the frontier and fight Indians as before, but, in addition, they were given the power of peace officers. On the northern border they fought Lone Wolf, Little Bull and other Comanche warriors; on the southwest they guarded the Texas side of the Rio Grande against Cortina and his band of cattle thieves; in the interior they drove the road agents under cover.

A name which for many years struck terror into the heart of border criminals was that of Captain Lee Hall. Captain Hall was at the head of a company of rangers which covered a territory as large as two or three ordinary states. They were a flying squadron that rode fearlessly into any kind of trouble where duty called them, and their battles with the Indians, the lawless white men and Mexicans were so numerous they were in almost constant active service for three or four years. So much was Captain Hall feared by those who had reason to dread the ranger service that numerous attempts were made to assassinate him.

In 1892, when the late General Shafter, then a colonel, was in command of Fort Bliss, near El Paso, Captain Hall and his command were camped near the fort. For several months a band of Mexican cattle and horse thieves had been raiding across the border, stealing horses and cattle and keeping the ranches in a state of terror. The band numbered 37 of the most desperate and bloodthirsty outlaws in the great Mexican state of Chihuahua, and Captain Hall was assigned to put an end to their depredations. He went about locating the outlaws in a way peculiarly his own. He won the confidence of one of the outlaws, and through him learned that the outlaws had a camp in the Chihuahua mountains, about 40 miles due south of El Paso. The camp was a natural fortification, and it teemed with stolen horses and cattle taken from the American side of the border.

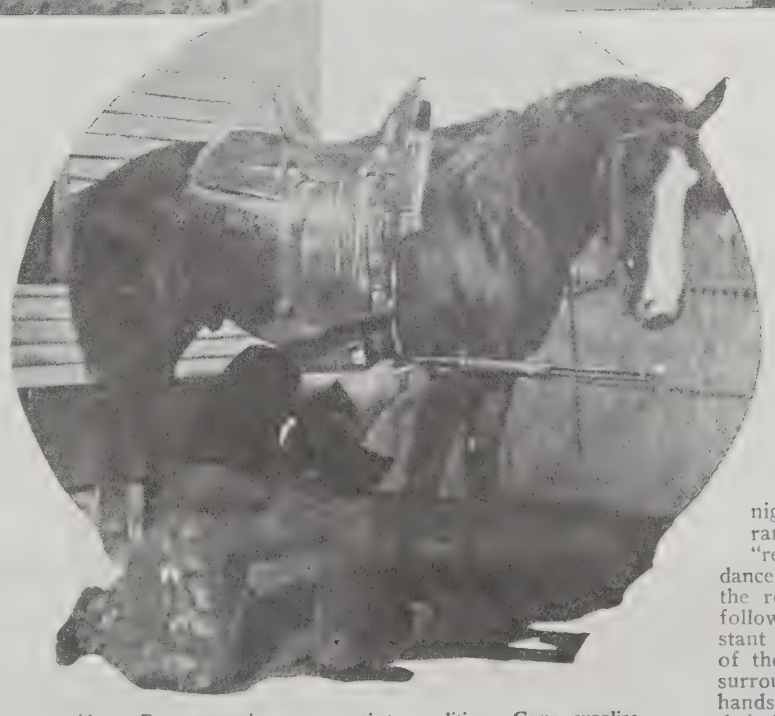
Colonel Shafter and Captain Hall were great cronies. Hall went to headquarters at Fort Bliss and told Shafter he knew where the Mexican outlaws had their camp and that he "had a mind to go and get 'em."

"Don't do that, Lee, it would be a violation of international law; get them some other way, but on this side of the river," Colonel Shafter told the ranger captain.

Hall gave the soldier to understand that he would see that the international aspect of the affair was kept in mind, and about an hour before sunset left Fort Bliss and joined his own command not far from Ysleta, a little town about 12 miles east of El Paso.

"Saddle up, boys—we are going to take a ride tonight," Hall said to his men. That night 50 rangers crossed the Rio Grande. They rode as rangers can ride and followed the trail through an unknown country with the skill of a plains Indian. At 4 o'clock the next morning they were outside the stronghold of the outlaws. Hall placed his men in a cordon around the camp, and at daybreak the battle began. It lasted an hour, and when it ended every outlaw was dead.

Hall rounded up the stolen cattle and horses, and at 6 o'clock the rangers started back for Ysleta. In those days the American army officers used to hunt in Mexico, but never in uniform. About five miles from the American border Hall and his rangers met Shafter and a number of his officers. They were hunting wild game.



"Lee, what have you been doing? I thought I told you it was against international law for you to get the outlaws on this side of the river," said Shafter, who knew when he saw the horses and cattle what had taken place.

"But, Colonel, I didn't get any Mexicans. I left 'em where I found 'em," Hall replied, and that was the end of what was perhaps the greatest of the ranger "invasions."

Thirty-five years ago there lived near San Antonio an old man who subsequently proved to be the brains of the famous "relay cattle stealing system." The man had four sons and two daughters, the latter noted for their beauty. So far as the outside world knew, he was entirely respectable. The rangers knew differently. Cattle thieves would take cattle and pass them north through the relay stations to the Indian territory, where the thieves in charge of the northernmost station in the system would dispose of them, and later distribute the proceeds along down the line to the old man at San Antonio.

The man discovered that the rangers knew of the game, and he decided to "get" Hall before any damage could be done. His daughters "made eyes" at the famous ranger, and Lee fell a victim—that is, he pretended to—to their charms. They announced one day that they were going to give a dance in honor of the ranger chief. As a matter of fact, and Hall knew it, the dance was arranged to slay him. On the night of the dance, Hall, accompanied by a single ranger, proceeded to the ranch of the chief of the "relay system." As he entered the room where the dance was supposed to take place, the women ran from the room, expecting that a fusillade of shots would follow. Hall walked up to the old man and in an instant disarmed him. He then proceeded to disarm each of the eight desperadoes. All thought the house was surrounded by rangers. Hall and his ranger tied the hands of the old man and the eight outlaws behind their backs and marched them into San Antonio. That is how the "relay system" was ended for all time.

Above Rangers starting on a scouting expedition. Camp supplies carried on pack mule in center. Below—A member of Company A ready for action.

Canada Now Is Capitalizing Her Climate

People Once More Permitted to Tell Its Advantages to the World

By D. M. LE BOURDAIS

IT IS again possible for a Canadian to advertise outside of Canada the fact that there is such a thing as a Canadian winter without fear of national ostracism. After a lapse of almost a quarter of a century Canadian cities are holding winter carnivals; and ice palaces will again rear their sparkling minarets in the crisp midwinter sunshine. This winter, Ottawa, Winnipeg, Calgary and a number of other cities will admit to the world that there is such a thing as a distinctive winter season—and take a certain amount of pride in the fact.

Ottawa is talking of a toboggan slide which will extend from the Chateau Laurier across the Ottawa River to Hull, on the Quebec side, which, it is claimed, will be the longest slide of its kind in the world. That the laconic description attributed to a certain Chinese —"Whish! walkee back milee"—shall not become too painfully realistic, it is proposed to bring toboggans and tobogganers back to the starting point by electric trolley. In addition, facilities will be provided for skating, skiing, snowshoeing, curling and many other winter sports and pastimes.

Rudyard Kipling is blamed by some for the taboo which has been placed on the good old Canadian winter—for a generation it has been in disgrace. It was Canada's family skeleton and has been most carefully kept from view. Kipling little knew the storm he was to raise when he celebrated the inauguration in Canada of the British Preferential Tariff of 1897 by his poem entitled, "Our Lady of the Snows," the refrain at the end of every verse of which concluded with the title phrase. The British poet was not writing of Canada's climate. The subject was entirely political; the allusion entirely poetical. Kipling merely wished to coin a phrase which should be expressive and fairly typical. There is no doubt that snow is common to nearly every part of Canada—in winter time, of course, and is about as typical as any other single thing. But at the time that Kipling wrote the great prairies of the Northwest were being newly opened up; the government and the railways were desirous of inducing immigrants to go on the soil, and it was felt that this object would be defeated if the impression got abroad that Canada was a land of snow and ice. Kipling's poem was read far and wide. Its political significance was not always understood, but Canadians feared that Canada had become indelibly associated in the minds of people the world over as a region of snowdrifts. So the word went out that winter carnivals and everything else which might tend to draw attention to the Canadian winter were to be thenceforth in distinctly bad form.

Montreal was the chief center of winter sports. Great ice palaces were built each winter in the square facing the Windsor Hotel, and thousands of persons took part in the festivities. Tourists were attracted in large numbers from south of the border line, and a great national institution seemed in a fair way to being established. But Montreal was—and is—dominated to a large extent by the Canadian Pacific Railway; and the C. P. R. possessed millions of acres of agricultural lands in the West that it was desirous of selling to settlers who would not only pay well for the lands but would produce future traffic and thus contribute a double profit. Winter carnivals thereafter became a thing of the past.

It was the railways themselves, however, that really first began to realize that climate might be an asset—winter climate as well as summer—although their realization of the value of the latter was not at all spontaneous. Canada possesses a wealth of scenic beauty; and the railways were not slow to capitalize it to stimulate tourist traffic. Many huge hotels have been erected throughout Canada's scenic wonderland, and the Dominion has been widely advertised to tourists and sportsmen in both hemispheres. But still for many years it was only as *summer* resorts that these places were known. However, there is good reason to believe that these resort hotels will soon receive as great an amount of patronage in the winter as they do in summer.

Last year, in one of its advertisements for the Highland Inn at Algonquin Park, Ontario, the Grand Trunk Railway actually boasted of the fact that the temperature rarely rose above the zero point! And it descanted on the joys of life in the open air—skating, skiing, snowshoeing or some other form of winter activity—followed by the cosy circle around the roaring open fire of logs. It really makes a strong appeal to a great many persons. The only wonder is that the potentialities of the Canadian winter were not more fully realized long ago.

In a certain sense Canada is climatically in a class by itself. In no other country in the world can two such distinct seasons as the Canadian summer and the Canadian winter be found extending generally over such a large area. Most countries having a summer as hot as Canada's have little or no winter. On the other hand, not many others having a distinct winter season with an abundance of snow and low temperatures have summer weather to compare with that to be found in Canada. Canada's summers are really like those of Southern Europe, while its winters are more like those of the Scandinavian countries; that is to say, taking an average of the Dominion. These two distinct seasons result in an entire change of activities, not only as regards sports and pastimes, but also in many lines of commerce.

Of course, climate varies considerably with the locality in a country of such wide dimensions as Canada. Perhaps the greatest factors having to do with climatic conditions in the Dominion are the Gulf Stream, on the eastern coast, and the Japan Current on the west. The former, meeting as it does the colder waters of the Labrador current flowing south from Davis Strait, covers the eastern seaboard of Canada with dense, cold fogs and has a marked effect on the climate of the maritime provinces. The warm Japan Current, on the other hand, bathes the shores of Northern British Columbia and causes balmy breezes to be wafted far inland, resulting in an earlier opening of spring in the Peace River Valley, in latitude 56 degrees, than at Montreal in latitude 45° 30′. Wheat, barley, potatoes and other ordinary garden vegetables have been cultivated successfully at Dunvegan, in latitude 56 degrees—originally a northwest company trading post—for more than 100 years; while prize wheat has been grown at Fort Chippewyan in latitude 58 degrees.

Above—Vegetables grown at Fort Vermilion, Alberta, 700 miles north of the international boundary. Oval—Wild red top grain grown north of the Arctic Circle.

The Alberta government maintains an experimental farm at Fort Vermilion, about 700 miles north of the international boundary, on which all the common varieties of vegetables, including asparagus, celery and early varieties of corn, and many kinds of small fruits, including strawberries and cherries, show abundant yields. Seventy-six different varieties of flowers are also grown.

So far north has the isothermal line been pushed in the Peace River district as a result of the beneficent influence of the Japan Current that the line of greatest summer heat passes through Fort Vermilion, while the winter temperatures are never as extremely cold as they are in Montana or in the Dakotas. Even in Yukon Territory, which is wholly above the sixtieth parallel of north latitude, many grains and grasses and a large number of varieties of vegetables are cultivated with success.

It is true that the farther north one goes the shorter the summer season becomes—speaking generally; although it must be remembered that, due to the Japan Current, already referred to, the isothermal lines in Canada run in a northwesterly direction. The shortness of the summer in the far north is compensated for in so far as plant growth is concerned by the greater length of the days. Whereas, at the Gulf of Mexico day and night are practically of equal length; at the Arctic Circle the sun shines for 24 hours out of the 24 during the summer season. Temperatures running as high as in the temperate zone, are not uncommon during midsummer, even above the Arctic Circle.

Apparently, the farther north that vegetation will grow and mature the better it is. Thus, it is the northern latitudes that grow the hard, glutinous wheat which has made the Canadian prairies famed the world over. Again, the best apples are grown in a northern clime where the season is long enough to mature them. The apples produced in the Annapolis Valley in Nova Scotia; the eastern townships in Quebec; the district bordering on Lake Ontario in Ontario; and the Okanagan and Kootenay valleys in British Columbia, have achieved much more than local reputations.

Canada possesses more than one-half of the fresh water of the globe and these vast bodies of water have a stabilizing effect on the climate. Then again, the deep indentation of Hudson Bay almost into the heart of the Dominion also has a beneficial effect. Much of Continental Asia lying in the same latitudes as the Dominion of Canada is subjected to a great deal more rigorous winter weather; and this difference is due in large measure to the presence in Canada of these immense bodies of water.

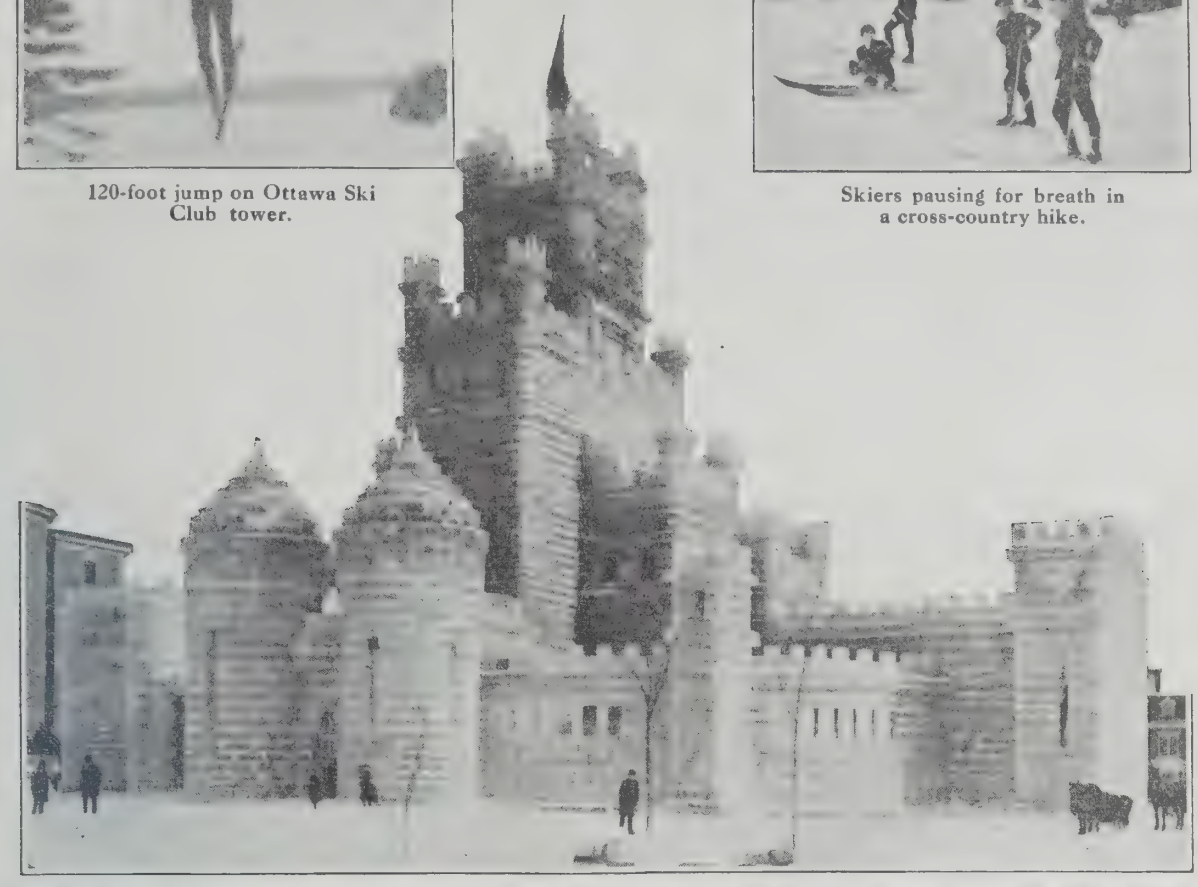
With the exception of a very small area in Southern Alberta and Saskatchewan—the northern extremity of the Great American Desert—and a portion of the interior of British Columbia, there is no arid territory in Canada. It is a country of dense growth. Excepting for the prairies, the country is —or was before the advent of the lumberman—one vast expanse of forest—a land of luxuriant grasses and brilliant flowers. Even the islands in the Arctic Ocean are carpeted thickly with grasses and bright flowers in summer.

The most southerly point of Canada is the Essex Peninsula in Ontario, which is in about the same latitude as Boston. Favored by the tempering influences of the Great Lakes near by, and shielded from the cold fogs of the Atlantic by the Laurentian Range, this section of Canada is famed for the wide range of its agricultural possibilities. Here the winters are short and mild, the summers correspondingly long and autumn a distinct season.

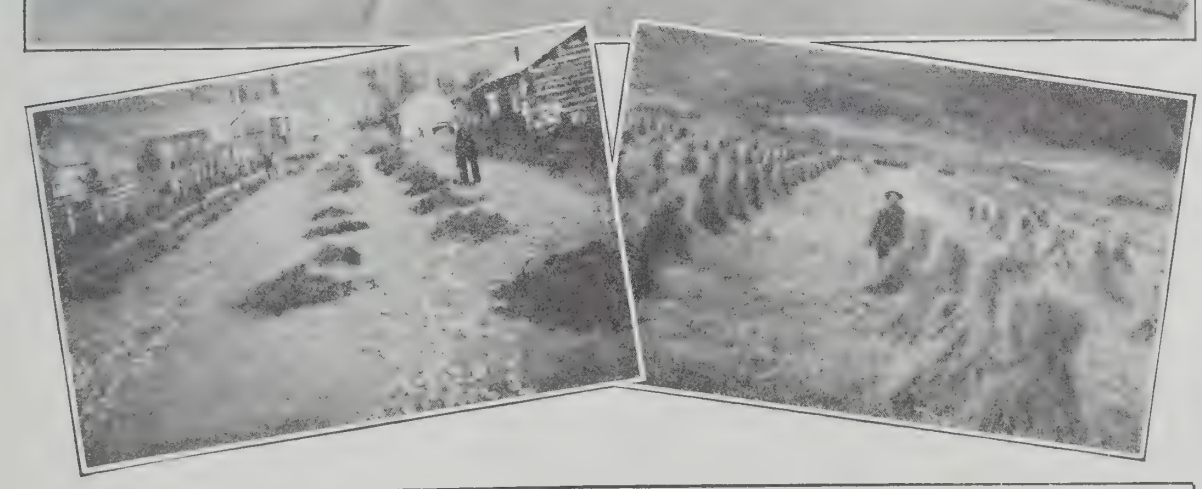
British Columbia, perhaps of all the Canadian provinces, has the greatest degree of climatic variation within its borders. The Yukon, lying as it does from the northern boundary of British Columbia to the Arctic Ocean, and east of Alaska, has what some persons might consider a long winter; but this depends a good deal on the individual point of view. Summer in the Yukon is a distinct season with high temperatures; growth of vegetation is both profuse and rapid.

While, as has been said, there is a considerable amount of misinformation throughout the world, and particularly in the United States, concerning Canada's climate, there probably is no part of the Dominion concerning which this misapprehension exists to quite such an extent as it does with regard to that part of Canada lying in Arctic and sub-Arctic latitudes.

For some years past Vilhjalmur Stefansson, the Arctic explorer, has devoted his time and talents in an endeavor to dispel this impression. Stefansson was ridiculed in some quarters when he made the claim that vast areas of the so-called barren lands are capable of grazing immense herds of reindeer. Having the courage of his convictions, he went to England and on his return announced that he had been successful in interesting a group of British capitalists in an extensive scheme to graze reindeer on a large tract in Baffin Land. Whereupon a western newspaper editor set up a cry that Stefansson had hoodwinked the poor ignorant British investor, and that his inevitable failure would ruin Canadian credit in the British market. The joke was on the western editor, when the announcement was made that the capitalists whom Stefansson had induced to invest in his "visionary" scheme were members of the Hudson's Bay Company, whose experience in the Canadian North goes back to 1670!



The editor was under the common misapprehension that the sub-Arctic Regions are practically covered with snow and ice the year round, and that in winter the snow gets to fabulous depths. Thinking thus, he could not understand how reindeer could feed themselves throughout the winter. Had he known that the snowfall along the Arctic Coast is extremely light and offers no obstacle to the animals feeding on the luxuriant grasses and mosses which are grown in the extremely hot, if short, summers; if he had known that the temperature rarely ever gets quite as low as it frequently does in his own province, he might have been able to realize that in its so-called barren lands Canada possesses what may one day become one of the greatest meat-producing areas of the world.



120-foot jump on Ottawa Ski Club tower.

Skiers pausing for breath in a cross-country hike.

The castle-like building is an ice palace in Montreal in 1885. It was constructed of ice blocks. After a lapse of more than a quarter of a century, several Canadian cities are this winter reviving the practice of building such structures. Canada ceased erecting ice palaces, because it didn't want to be known as a land of snow and ice. Below the ice palace is a reproduction of a photograph taken in Montreal in 1885, showing a typical toboggan slide. Note the "blanket" costumes worn by the tobogganers. The small pictures at the bottom show what may be termed the other extreme of Canada's climate. At the left is a summer picture of growing potatoes away up at Dawson, Yukon. At the right is another summer picture—an oat field at Hunker Creek, Yukon.

How Is California to Be Saved?

Concluded from page 7

Japanese immigration, not only male, but female, and not only laborers, skilled and unskilled, but "farmers," and men of small trades and professions, as recommended by Theodore Roosevelt.

Permission for temporary residence only for tourists, students, artists, commercial men, teachers, and so on.

Second—Such exclusion to be enforced by United States officials, under United States laws and regulations, as done with immigration, admitted or excluded, from all other countries; and not, as at present, under an arrangement whereby control and regulation is surrendered by us to Japan.

Third—Compliance on the part of all departments of the Federal Government with the Constitution, and the abandonment of the threat or attempt to take advantage of certain phrasing of that document as to treaties, which, it is claimed, gives the treaty-making power authority to violate plain provisions of the Constitution and statutes in the following matters:

(a) To nullify state rights and state laws for control of lands and other matters plainly within the state's jurisdiction.

(b) To grant American citizenship to races of yellow color, which are made ineligible for such citizenship.

Fourth—For the Japanese legally entitled to residence in California, fair treatment, protection in property rights legally acquired, and the privilege of engaging in any business desired, except such as may be now or hereafter denied by law to all aliens, or to aliens ineligible to citizenship; and provided particularly they may not hereafter buy or lease agricultural lands.

Now, therefore, be it

Resolved by the Senate and Assembly jointly, That the legislature of the state of California hereby endorses said declaration of principles and urges that the President, the Department of State and the Congress of the United States adopt and observe the policy therein stated; and be it further

Resolved, That the secretary of the Senate be and she is hereby directed to transmit copies of these resolutions to the President and the Secretary of State of the United States and to each of California's senators and representatives in Congress.

C. C. Young, President of the Senate; Henry W. Wright, Speaker of the Assembly; Martin C. Madsen, Private Secretary to the Governor; Frank C. Jordan, Secretary of State do hereby certify that the same was duly filed with the Secretary of State on April 27, 1921.

GRACE S. STOERMER,
Secretary of the Senate.

Over and beyond this, the Japanese Exclusion League, to whose yeomen service in behalf of white California undoubtedly is due the fact that the Japanese population of that state does not now exceed the white, makes one demand which, it seems to the writer, is most important, in view of the 50,000 Asiatic voters we soon shall have on our hands. This league asks:

"An amendment to the Federal Constitution providing that no child born in the United States of foreign parents shall be considered an American citizen *unless both parents of that child are themselves eligible to citizenship.*"

The Japanese Exclusion League, commenting on this demand, says:

"The Japanese child who enters this country at, say, one month of age, is not permitted to apply for American citizenship, on the theory that it is not desirable material for an American citizen; yet, under the present law, the Japanese child who *happens to be born* in the United States, instead of coming here when one month, or one day, old, is declared an American citizen. This certainly is inconsistent, aside from being most dangerous.

"It will be urged that the enforcement of these measures against the Japanese may produce friction and international complications. Such a policy, however, should not hurt Japan's pride, for it is based on economic, and not on racial, grounds. It embodies, in effect, the same prohibitive measures which Japan enforces today against the Chinese and the Koreans, who, although of the yellow race, are denied admission into Japan, on precisely the same economic grounds. Similar measures are enforced against Japan by Canada, Australia and New Zealand, even though Great Britain is Japan's ally by treaty.

"Put the shoe on the other foot. Let 100,000 American laborers settle on one of Japan's islands, bringing with them American customs, traditions, habits and means of establishing themselves permanently—and the Japanese Government would not tolerate it for a single moment."

BRIEFLY TOLD

Rene Maran, a young Negro author, has won the annual prize of the Goncourt Academy for the best French novel of 1921. This author was born on the island of Martinique, French West Indies. The novel deals with colored life in Central Africa and is entitled "Batouala." The Goncourt prize is worth only 5,000 francs, but is one of the most cherished literary awards of France.

The sidewalks of Manchester, Vermont, are of marble, the commonest rock found in that vicinity.

The electric light and power company of O'Neill, Nebraska, has begun to burn corn for fuel, according to reports.

Passengers on a Cunard liner, running from London to Melbourne, Australia, as an experiment, recently launched a raft on which was fastened a tin box containing 40 letters and 45 shillings to cover the cost of postage. A request in English and Spanish that the finder should post the letters by the first available mail also was inclosed in the box.

One man in the United States is living in approximately four different states at the same time. He is a ranchman whose house and lands cover the corners of Utah, Colorado, Arizona and New Mexico. The windmill that pumps water for his stock stands in New Mexico and pumps water in a trough in Arizona. The house is exactly in the center of where the four corners of the several states meet.

Washington now boasts of a manless hotel. This hotel is to be run exclusively by women. The bell hops, porters, cooks, room clerks and other employes are all women. The manager is a woman, formerly manager of the government hotel for war workers.

A lawsuit, started some 600 years ago, was recently called for trial in a French court. The costs and fees of several centuries exceed the value of the object sought. It has to do with the distribution of some land in the Jura Mountains, between the communities of Meussia and Charcilla.

A whale ran aground in shallow water inside the Atlantic entrance to the Panama Canal and was killed by machine gun fire by canal employes, who undertook to salvage it for oil and bone. The whale was too heavy for the 75-ton railroad crane to handle, and a tug attached a line to the carcass and towed it to a point 12 miles outside the breakwater, where a naval airplane dropped two bombs weighing 160 pounds each from a height of 1,000 feet and destroyed it.

Austria and Germany are now outbidding Switzerland for the tourist traffic. Because of her exchange, Switzerland cannot compete at present with these two countries. Hotels catering to tourists are doing a large business in the Tyrol, in Trentino, in Savoy and in the Black Forest.

The new immigration law of America has kept 1,000,000 foreigners out of the United States in the last six months, according to the chairman of the House Immigration Committee. Only 180,000 aliens entered in the first five months of the last fiscal year.

The smallest modern gold coin in the world, so far as is known, has just been minted in Geneva. It represents the gold franc and is the coin on which the budget of the League of Nations is to be calculated. In shape it is octagonal and on one side is engraved the initials "S. D. N." (Societe des Nations). It is valued at about two cents and weighs .03225805 of a gramme.

Fifty years ago the Marquesas Islanders numbered more than 50,000. Now there are but 1,800 natives. Smallpox and tuberculosis decimated the population.

The French National Aviation Bureau centralizes technical information and distributes nearly 32,000,000 francs annually in subsidies, which keep 185 planes in operation. International lines to London, Amsterdam and Warsaw cover more than 1,000,000 miles each year and carry 300,000 pounds of freight, 7,000 passengers and 15,000 pounds of mail. Commercial aviation has been entered on the list of the regular budget expenditures of France.

The Australian House of Representatives has passed a bill authorizing a loan of 10,000,000 pounds sterling to re-establish World War veterans on land, according to reports from Melbourne.

Poppies transported from Flanders Fields to dump heaps of Jersey are adjudged a nuisance and a pest to agriculture by the Federal Horticultural Board. They are to be plowed under at once. The seed of the poppies came over in earth ballast, shipped from France by troop transports. The pathologist of the Federal Horticultural Board believes the reason the poppy blooms in Belgium and France is because the farmers cannot get rid of it.

No word was spoken at a recent trial of a man arraigned on the charge of murder at the Old Bailey in London. The prisoner was deaf, and as there was no person in court competent to use the sign language, the entire proceedings were conducted in writing.

A recent earthquake in Tokyo broke the city's water main, cutting off the water supply for a time.

A lighthouse, the flash of which can be seen for nearly 200 miles, has just been completed in Paris. It is intended for the new air station at Dijon and has been under construction for two years. The beam of light thrown from groups of lamps has an intensity of 2,000,000,000 candlepower. The lighthouse will be set up on Mount Africa, in the east central part of France, as a guide to airplanes on the great airways to the south and east of Europe.

The chamois is becoming rare in the Savoie Mountains in Italy and in Switzerland and unless the killing of these animals is proscribed they will become extinct inside of 20 years, according to departmental officials. Animal lovers are petitioning their parliaments and demanding that the chamois be protected. Thousands of veterans returning from the war with modern rifles and supplies of ammunition hitherto unattainable are responsible for the slaughter.

The life-sized figure of a woman carved in a solid rock was recently found by campers in a remote corner of Crater Lake, National Park, Oregon. It has been impossible to learn, so far, when the carving was done or by whom. The initials M. A. Y. and markings which appear to be 1843 are seen near by. This region was practically unknown by white men in 1843.

A new discovery by which vulcanized rubber may be made in any shape or color, ranging from the most delicate pink and blue to the deepest purples and blues, has been announced. Toy balls made of rubber may now be made highly colored in designs similar to patterns in linoleum. No paint can chip or come off, because the color is in the rubber. The new discovery has broadened the field of usefulness for vulcanized rubber.

When the faces of the large clock on the administration building tower at Northwestern University of Evanston, Illinois, differed some 15 minutes in telling time, investigation showed that doves were nesting in the mechanism of the clock.

Japanese reporters at the Disarmament Conference twice sent Secretary Hughes' message to their home paper, the *Asahai* of Tokyo at triple rates. The minute Secretary Hughes made his naval offer, representatives of the Tokyo paper prepared a 400-word summary containing every salient point. This they sent urgent cable, at three times the regular commercial rate, or $3 a word. For fear of cable failure, they also sent it urgent wireless at $3 a word. They received a one-word cable from their managing editor congratulating them on their "scoop."

NEW MONEY FOR OLD!

THE PRINCE IN INDIA

Chronicler of the Neglected Truth

"Fiat Money!"—by Those Who Hold the Fiat

Money Is Legislation and International Financiers' Consent

"FIAT Money!" It sounds like "Murder!" doesn't it? It is shrieked in the tone of "Murder!" and is intended vastly to impress people who do not know what it means.

All money is "fiat money." "Fiat" simply means, "let it be so." Someone in authority, or everybody in concert, says of shells, "Let shells be money," and by that fiat shells become money. The fiat changes from period to period. At times the fiat was placed upon tobacco, and that became money; or a peculiar kind of stick, into which notches could be cut to indicate value, became money by the fiat of the tribe using it.

Fiat is first a matter of custom and practice, then a matter of law. What the people will receive, what performs the functions of money without "jamming" the channels of commerce, has a good chance of obtaining the "fiat" which makes it money.

If you have a gold piece in your pocket—likely you have not, for gold is about the only money we never see, though it is said to be the best money and is held to be the base of all money—but if you have gold in your pocket, all you know about its being money is the "fiat" of the government stamped upon it. The government says, "Let this be money to the extent of ten dollars," or whatever it may be; and you accept the fiat. In France the same amount of gold may be made by fiat to represent more than ten dollars, and the Frenchman accepts that fiat.

Take a piece of silver. It becomes money, too—although legally "demonetized"—because of the American "fiat" stamped upon it. Or a piece of nickel becomes five cents by fiat. Or a piece of copper becomes a penny, one cent, by fiat.

Take out a dollar bill. Nothing but inflammable paper. Very little different from many grades of paper used for wrapping or writing. Yet by the "fiat" of the United States that same sheet of paper may become $1, or $5, or even $100,000. The same sheet of paper intended for the $1 press may be put into the $100,000 press and stamped with the government "fiat" which makes it pass current, acceptable at any bank or in any business, for $100,000.

A great deal of nonsense and a great deal of unfairness to the public mind is hidden in the cry of "Fiat Money!" whenever a plan to release the tied-up energies of the people is proposed.

There is nothing wrong in money. It is a most useful commodity. Civilization could not very well exist without it. There is nothing wrong in the power of governments to declare what element shall be money, how that money shall be prepared and how protected in all its uses. There is nothing wrong in banks for the safekeeping and useful distribution of money.

What is wrong? This is wrong: that a broad-gauge industrial system is held up and cannot move because of our narrow-gauge money system. Wealth must slow down to pass through the narrower gates of money, because there is more wealth than there is money to move it. And money itself must slow down to pass through the still narrower neck of gold, because there is more money than there is gold to validate it. If our fiction of a gold standard were challenged and every holder of good United States money should demand that his money be turned into gold, we should find that the "gold basis" proved too narrow years ago. If the people were to demand in one day or one month their money in gold, they would discover that most of the money they are carrying around has no gold behind it—nothing in the world behind it *except the United States!*

And that is what makes American money good—the United States, with its forests, its farms, its waterfalls and its factories. It is the "fiat" of the United States that makes money good for common folk.

Of course, when you get into the realm of international finance, which belongs to no nation whatever, and spurns every nation equally, there you find that neither the fiat of the United States, nor the fiat of Great Britain, nor any other fiat counts for a cent, but only the cold gold bullion weighed in a scale. It is after all the fiat of the International Financiers which governs the money of the world and by indirection, through the "gold standard," the money of every country.

THE money question, although conceded to be the most important, is perhaps the least understood by the masses of any of the civic problems of our time.

Money is the currency of a country, the standard of payment, whether of coins, circulating notes, or any other commodity, anything which freely circulates as a common, acceptable medium of exchange in a country, even though it cease to possess such value on passing into another country. Aristotle says, "Money exists not by nature, but by law," and economic and financial authorities uniformly regard money as a great aid to civilization, in the elimination of waste attending the earlier exchange of commodities commonly called barter.

Money thus becomes the medium of exchange by which real wealth, the product of the soil and labor, finds a ready market.

The potency of the law in a civilized country to impart the quality of acceptability to that which it recognizes as money is clearly shown in the operation of the Bank of Venice during several centuries, throughout which its deposits, or credits which were never payable, but only transferable on the books of the bank, were at a premium over coins, because they were the standard of payment. Indeed, the bank deposits were the standard in which the value of coins was expressed. In London, during the crisis of 1817, according to Thomas Baring, it was found impossible to raise any *money* whatever on 60,000 pounds of silver, and in 1864 it was equally impossible to raise a rupee on 20,000 pounds of gold. The silver was not a legal tender for more than 40 shillings, and the latter not at all. These illustrations are given to clear the mind of false impressions and to show that the modern use of gold and silver as money depends solely on the law, and in no wise on their supposed intrinsic value. Gold and silver in themselves are worthless except as they are *desired* or utilized by man.

Money has in various stages of the world's history been based on many commodities, including land. Among them have been cattle, our word *pecuniary* being derived from the Latin term for cattle. The Jews, in addition to silver, had "jewel" money. Sicily once used leather money, and as late as the eighteenth century the Chinese made money of the inner bark of the mulberry. Needless to multiply instances.

Congress Creates Our Money

MODERN developments in industry and commerce have made the use of money imperative. For this reason the money question is the question of the times. The government having sole power of issue, under the Constitution, there can be no valid substitute. In fact, the use of anything but authorized legal tender is forbidden by law.

Money does not depend for its value on anything but the real wealth of a nation, its power of production. The first national money in this country was authorized by the Continental Congress in 1775 and consisted of "bills of credit," guaranteed by the faith and credit of the colonies, to each of which was assigned a quota as its share of obligation; but the United Colonies stood back of any member whose quota at the time of redemption might be wholly or partly in default.

It must be understood that at this time the Continental Congress was merely a voluntary conference of separate states, without power to dictate action in any. The delegates, drawn together as a measure of mutual defense in the War of Independence, had no power to levy taxes or to compel the people to accept their enactments.

The war was won with paper money—this much discredited "paper money!"—when gold and silver were not to be had. Indeed, it may be remarked that *coin never won a war.* At the first cloud on the political horizon, it seeks the farthest recesses of the vaults in which it hides. Its only use during the Revolutionary War was the purchase of traitors lured by its glitter when the patriot cause seemed doomed.

But the Continental Congress only "promised to pay" money and naturally its inability to secure coin to redeem its paper issues led to a depreciation of the latter, holders losing faith in its ultimate redemption. This devotion to the creed that some day all paper currency must be cancelled by exchange for coin is the fatal weakness of our national monetary system as it has functioned from the beginning of the country's existence.

The power to *create* money is vested in Congress by Article VIII of the Constitution, empowering that body "to coin money and regulate the value thereof, and of foreign coin," while Article X says, "no state shall...coin money, emit bills of credit or make anything but gold and silver legal tender for the payment of debt." This is all the Constitution provides on the subject of money. All other regulation is by statutory law.

From the beginning of our national finances until the present day, unfortunately, *the power to issue money has been delegated to banks.* Robert Morris, whose master mind is credited with guiding the Republic through the trying days of its infancy, was appointed superintendent of the finances, and recommended a plan for organizing a national bank which was adopted, the government holding a majority of the shares.

When Gold Was Cheaper Than Silver

IN 1791, on the recommendation of Alexander Hamilton, then Secretary of the Treasury, Congress chartered for 20 years the first Bank of the United States —Robert Morris' bank had been called "the Bank of North America"—and in 1816 the second bank of the United States was chartered, its charter expiring in 1836.

From the foundation of the government until the time of the Civil War, except for certain Treasury notes bearing interest and not generally used for money although payable to bearer, the issues of these two national banks and the banks of the District of Columbia, were the only national currency. Banks of issue under state charters, however, supplied the need of active circulation.

Possibly it may be well here to define what is meant by "the free and unlimited coinage of gold and silver," for that was the original design in establishing national mints. In pursuance of its legal right to exercise the power to "coin money and regulate the value thereof," conveyed in the Constitution, mints were established at various points, where the owners of the metal could deposit it and take away the equivalent coin. The government recovered its cost of assay and minting in the difference between the value of the fine metal (the government receiving full weight) and the alloy in the finished coin. The government did not buy bullion on its own account: the amount of gold coined was governed by the need of business. The circulation of coins struck in private mints was permitted, while paper money, bills of exchange, and other private bank issues also were current.

Modifications in the relative weight of gold and silver occurred at intervals, because the white metal was undervalued in proportion to the yellow, until the original silver dollar was reduced in weight and at one time the gold content of coins was increased. The final adjustment was approximately 16 ounces of silver to one of gold, the present ratio. Originally the standard of fineness was that of the English coinage, 11 parts pure metal to one of alloy. But this, too, was changed and the French standard of .90 pure metal adopted.

Even at the legally established ratio, silver was undervalued, and gold was the natural selection for money use, being the *cheaper* of the two metals, because of being the more plentiful then. This resulted in a scarcity of fractional currency or "small change," for which gold was unfit. But when this fractional currency was coined of silver, it was hoarded or remelted for bullion, because as silver it was worth more than the money value stamped upon it. To remedy this fault, in 1853, the amount of silver in the half and quarter dollars, dimes, five and three-cent pieces was reduced to make the *money* value greater than the market value of the *bullion.* For this purpose the government began the coinage of this subsidiary currency on its own account, buying silver at market and issuing the money but limiting its legal tender power to $5. The change did not affect the status of the silver dollar, which remained at a small premium over gold, but was found necessary in business, despite its high bullion value.

The discovery of free gold in California and Australia had its effect on the coinage of the two metals, and the economists and experts of the '50's proposed the demonetization of gold to avoid a flood of "cheap money"! That sounds strange and yet familiar—strange that gold should be called "cheap money," and familiar that the cry of "cheap money" should be raised. But soon afterward a discovery was made of rich silver deposits, which in turn made silver the "cheap money"—a cry that ended in the establishment of gold as the *only* money base. The Netherlands, Belgium and the Germany of that day *actually did demonetize gold,* going to a single silver basis, and but for the refusal of France to join in the disestablishment, England and the United States probably would have followed suit. This in spite of the fact that England was already on a gold basis, having abandoned silver, which was also undervalued in her system, and her full-weight coins were in consequence exported to France. France, being a debtor nation, naturally clung to the cheaper metal, gold, as the money to pay off her obligations, and welcomed the threatened "flood" of "cheap money"—gold!

Gold the Slacker—Paper the Volunteer

THE Civil War found gold and silver seeking safety in the vaults and stockings of the holders. The government sought to borrow, but then, as now, money would not volunteer in the country's extremity. Secretary Chase secured authority to issue $60,000,000 of demand notes of full legal tender power, and these supplied the shortage of money so successfully that he applied for added authority to issue the well-known "greenbacks," his plan being to make that, too, a full legal tender, that is, receivable in payment of all debts, public and private. The necessary legislation was passed in the popular body, the House of Representatives, but it was so amended in the Senate that it finally became law with the proviso that the notes could not be used for payment of duties on imports or interest on the public debt. However, the greenback was good enough to buy government bonds, the interest on which must be paid in coin.

The result was that the actual money of the country was the greenback. Gold became a commodity, the same as wheat, cotton, iron or brass. Worse, it became a speculative commodity, and at one time it took more than three dollars of the people's money, the greenbacks, to buy what the law declared to be a dollar in gold. The fact that the Treasury notes maintained a parity with gold from their issue to the present day tends to establish the claim of those who believe in "fiat" paper money and that gold is not indispensable as a money unit.

Children Now Can Teach Themselves to Read

New Method That Fascinates Youngsters May Supplant A B C System; School Boys and Girls Will Progress Much Faster Through Plan

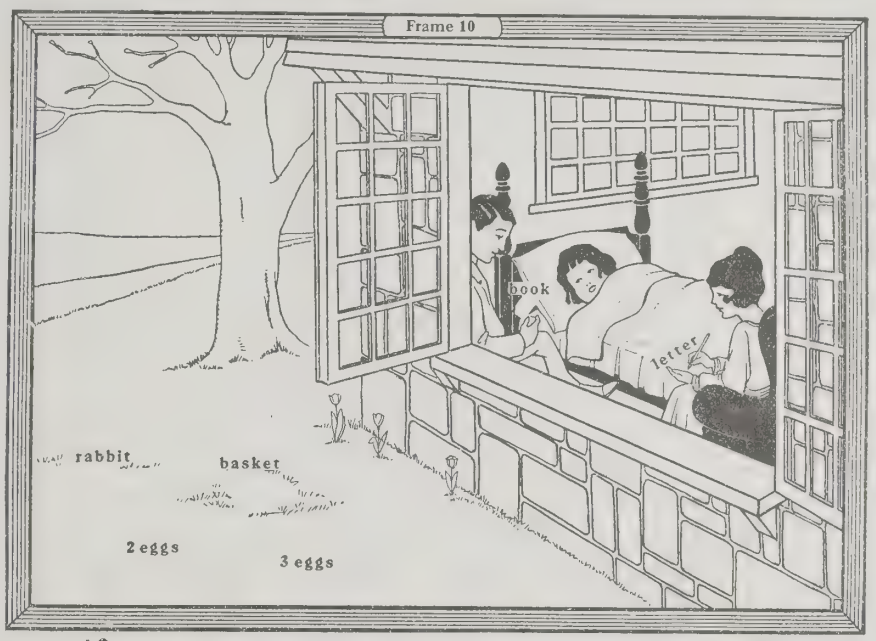
By EDWARD J. BECK

WHEN Mary Jones, now eight years old, started to school in Detroit two years ago she was taught to read by a modernized version of the venerable A B C method. Being an average child, Mary kept up with her class and when the term was over, she was able to read the 125 different words in her primer with a fair degree of accuracy.

Recently, her little brother, Johnny, began his pursuit of knowledge in the same room and with the same teacher. Though he is no brighter than his sister was at the age of six, he is going to progress just twice as fast as she did. He is learning to read by a fascinating new method. Judging from the records of the experimental schools, where the new method has been tried, Johnny will be the proud master of 190 words before the term is half over. Moreover, Johnny will teach himself. The teacher will merely be a helpful spectator of his joyous and zestful self-education.

Mothers who desire to put into the hands of their small children playthings that will completely absorb their interest for long periods of time can find few toys or games that possess the appeal of the Detroit Standard Practice Tests for teaching reading. Though these materials were designed primarily for pedagogical purposes they are so fascinating to children they are certain to enjoy a wide popularity merely as nursery amusements. They satisfy the child's desire for novel experiences involving self-directed activity.

The new method is the product of the ingenuity and specialized knowledge of Miss Nila Banton Smith, supervisor of primary grades, Detroit, and Dr. S. A. Courtis, director of the Teachers' College, Detroit, and leading authority on educational measurements. It has been tried with various primary classes in Detroit and at the Teachers' College, Columbia University. The unanimous commendation which the Detroit innovation has received from all educational experts who have investigated the plan justifies the prediction that it will be introduced all over the country as soon as the materials are available and will supplant the slow, laborious A B C method long in vogue.



In the conventional Treasure Island stories, the soldier of fortune learns that there is buried gold in a certain area. A dying man whom he has befriended gives him a cipher which tells the exact location of the treasure. He cannot find it until he is able to decipher the cryptic directions. He has a powerful motive for learning to read the mysterious symbols.

This illustration presents a close analogy to the motivation involved in the new Detroit method for teaching reading. The teacher or mother shows the child how he can build up pictures. The explanation and demonstration of the materials create in him an irresistible desire to engage in the pleasure-giving and self-satisfying activities.

First, there is a tablet of incomplete pictures called frames. In each frame certain objects are missing. Cut-out pictures are to be pasted in prescribed places on the frame. The names of these objects are printed at the place on the frame where they belong. In the illustration the word "rabbit" appears under the tree. A cut-out rabbit is supposed to be mounted in this spot. The rabbit is to be colored brown with a crayon.

Right here Johnny runs up against an obstacle that compels him to teach himself to read. If he cannot read the word "rabbit" he will not know what cut-out to mount under the tree. If he is unable to read the directions, he will not know how to color the rabbit. Reading is necessary to him as a tool to achieve his aims.

A dictionary and a book of directions are Johnny's aids in decoding what to him is a strange cipher—the printed English language. The dictionary contains the pictures of objects with their printed names beneath. It enables Johnny to recognize the symbol that means "rabbit." The book of directions tells him what to do. "Cut out the rabbit; color the rabbit brown," the instructions say. To go ahead with his interesting activity, he must learn to derive meanings from those black-and-white groups of letters that constitute words and sentences. In seeking information on how to build up a picture, Johnny teaches himself to read. The book of directions is a disguised primer.

The frame on which the cut-outs are mounted. To build up this frame the child must teach himself to read the words seen in the picture and the section in the book of directions which tells him what to do.

(C) by Regenia R. Heller

The completed frame. The cut-outs at either side of this picture are cut out by the child, mounted on the frame and then colored according to the directions.

In lesson 10, which also is illustrated, Johnny must master not only the 10 new words printed on the frame and cut-out sheet, but must also read 45 short lines of directions before he is able to complete the building up of his picture. When he has completed his task, he brings the frame to the teacher. She hands him a small sheet, which is a representation of a correctly completed frame. He checks his own accuracy by comparing his work with this sheet. If there are mistakes or omissions, he goes back to his seat to finish the assignment correctly.

When Johnny has successfully built up a picture, it may be assumed that he has mastered all the printed matter bearing on the assignment. But the teacher tests the correctness of this supposition by asking Johnny to read orally the story found on the sheet he used to check his work.

This story embodies the words just learned, in a narrative form. Each pupil has a loose-leaf binder to hold these sheets. It is called "My Story Book." As soon as Johnny demonstrates his mastery of a lesson it is bound into his own little volume. He feels the pride of possession, for he is permitted to take his book home to show his parents the tangible evidences of his progress. Parents are thus made fully acquainted with the content and rate of their child's learning.

For lesson 10, the story which the pupil reads orally and binds in his attractive booklet, follows:

The little girl is sick.
Her father will read a book to her.
Her mother will write a letter to the rabbit.
The rabbit will get the letter.
He will read it.

Then he will color the eggs yellow, green and blue.

He will put grass in a little basket.

He will put four eggs in the grass.

He will give the basket to the little sick girl.

The only complaint the mothers have made against the new plan is that their children, in some instances, cry for the materials during the week-end and their tears cannot be stopped by gratifying their wishes because the materials have not yet been printed for public distribution.

The Detroit method makes it possible for a teacher to handle larger classes without neglecting any of her pupils. The problem of discipline in the classroom is solved and the teacher is relieved of a large drain on her store of nervous energy. Since each child progresses at his own rate, the old charge that the school does not take account of "individual differences" is fully met. Each child will encounter some difficulty peculiar to himself and will invoke the assistance of the teacher to aid him in surmounting it. Knowledge is not forced on the child, as it was by the old method, but he eagerly seeks it. Though the teacher helps the pupil in the crucial places, the real responsibility for his progress rests on the child himself. He teaches himself and learns to read in his own way and according to the peculiar workings of his own mind.

The new method establishes the dictionary habit. The story sheets enable the child to appraise his own skill and to be an intelligent critic of his own work. A valuable moral training also is acquired, because the new plan requires self-control and develops a capacity for self-direction along the lines of worthy purposes.

Dr. Courtis explained the theory underlying the tests as follows: "Purpose is the key which unlocks every educational difficulty. So important is purpose that the best modern definition of education describes it as 'growth in power to purpose and to achieve.'

"This means that in teaching reading, the best results will be obtained, not by the teacher who works for results in reading, but by the teacher who sees in reading situations a new field in which to give her children experience in 'purposing' and who develops 'power to purpose,' letting the reading results take care of themselves.

"The teacher, who in the spirit of service directs her efforts toward helping children carry out their own purposes in picture building and reading, will not only have the satisfaction of seeing her precious charges grow in personality, character and intellectual power, but to these products, which are the essentials of all true teaching, will find added as a *by-product* that thing for which she did not work, namely, understanding control of that most important of the school arts, the ability to read."

The Nation's Budget

CHARLES G. DAWES, director of the budget, deserves commendation for his first report recently submitted to Congress by President Harding. No more important fiscal document has been placed in many a long day before the body that controls the nation's purse strings. For the first time in the history of the United States, a national budget has been prepared, based from estimates of the spending departments acting under a strong and continued executive pressure for economy and efficiency, and under a unified system of accounting.

Marked as has been Director Dawes' work of pruning expenditures, he has not been able to balance his budget. Total expenditures for the fiscal year ending June 30, 1923, have been hammered down to $3,505,754,727, as compared with $3,967,922,366 for the current fiscal year. But the excess of expenditures over receipts in the estimates for next year are placed at $167,571,977 as compared with the deficit of $24,468,703 for this year.

This increase of $143,103,274 in the deficit is more than accounted for in the decrease of $605,270,913 in estimated receipts. If next year's receipts were placed at the same figures as those of 1921-1922, the comparison would show a balance of $580,802,210 on the right side of the Treasury ledger.

Of the total estimated expenditures for the fiscal year ending June 30, 1923 (the first year covered by the new budget system), *approximately $2,900,000,000 is to pay for past wars and to keep up the fighting forces of the nation, leaving only about $600,000,000 for the peace-time pursuits of the national establishment.* Plainly, Director Dawes did not feel warranted in counting on any substantial reductions in war outlay as a result of the Disarmament Conference. President Harding, however, suggests, as one way of adjusting the discrepancy between income and outgo, the reduction of the naval supply account by $100,000,000.

We have less reason than have European governments for the bad business of unbalanced budgets. The director seems to have done his part, as far as the executive authority will allow. Apparently, it is now up to Congress to make the budget balance by such further cuts in government costs for the next fiscal year as will put us on the safe side.

Conquering the White Plague

THERE is much to be thankful for in the Federal statistics showing a decrease of nearly 100,000, or about 40 per cent, in deaths from tuberculosis during the last year. The census bureau announces that the total mortality from this cause in the United States during 1921 was 122,000 as against 220,000 in the previous year. And the trend of the tuberculosis death rate is reported to be steadily downward.

Surely it can be only a matter of time until this dread scourge is as completely wiped out in all civilized countries as yellow fever and cholera have been wiped out in the United States. In large measure, the saving of so many human beings to life and health and usefulness must be attributed to an increase in the general intelligence of our people, especially in the matters of sanitation and hygiene. The importance of proper treatment in the early stages of the trouble and, even more, public education in the observance of precautions against its spread through contagion, are being more and more appreciated.

And a big by-product of the gain is an increase among us of the social sense. We are our brother's keepers!

Free Ireland's Future

THE vote in Dublin by which the treaty constituting Ireland a "Free State" in name and in substance was ratified, has immensely more than political or sectional significance. Marking the end of the bitter and unhappy seven hundred years' war between Ireland and England, it marks also an important stage in the forward movement of world democracy and human brotherhood. Following close upon the emergence of the South African Union in what Sydney Webb calls the British League of Commonwealths, it may be said to prefigure fulfillment of the ancient prophecy of a "Federation of the World" in which all battle flags shall be furled forever and peace be permanently established and exalted.

At the same time, this birth of the Irish Free State clears the way for a broadly beneficent development of the possibilities latent in a reborn nationalism, and that in a land and among a people in which the national spirit has shown a vitality and an intensity hardly equaled in the world's history. Who can question that humanity in our western world is just now in distinct need of such refreshing and renewing baptism as may be drawn from the wells of the ancient Gaelic culture?

In Ireland an indigenous culture—poetry and song, arts and letters, science and philosophy—flourished when Germany and France were barely emerging from barbarism and when even Italy was shadowed by that decadence which made the once proud empire of the Romans the easy prey of the Goths and Vandals. In Ireland, the pure and primitive Christianity of the first three centuries—when its vigor and growth amazed the world and still amazes the historian—took root and flourished in soil prepared by the old Druidic religion to favor its best development.

The Gaelic renaissance associated with the Sinn Fein movement is possibly regarded by mundanes and materialists as something of a "dreamily sentimental" nature, having at most a merely "literary" meaning. Its fuller realization and adaptation to modern needs may be found to include sane solutions for present and pressing economic problems the world over. The old Brehon laws provided a land system at the base of the economic structure that had much to do with the exact and equal justice, the high standards of morality, the high thinking and plain living and the spread of learning that marked the golden age of Eirean. Michael Davitt, "Father of the Land League," became an ardent disciple of Henry George and was wont to declare that the American reformer's ideas were wonderfully in line with the ancient Irish land system in which actual use and occupation formed the best title, speculation and the holding of the land out of use were discouraged and the fullest and wisest development of natural resources fostered as against the sort of selfish exploitation of which our depleted forests, petroleum billionaires and petroleum wars, anarchic coal industry and "rent hogs" are examples. There was a time when Henry George believed that Ireland would be the first country to adopt the single tax.

Beginning with agriculture, in which the co-operative organizations, so wisely fostered by Sir Horace Plunkett, have been such a help, despite the harassing conditions imposed by English domination, the actual development and utilization of Ireland's natural resources offers a splendidly attractive and remunerative field for the exercise of the energies of her people. There is less land now under plow in Ireland than in any other country in Europe except Turkey, this, thanks to the abnormal abandonment of so large a portion of the soil to cattle grazing. What Lionel-Smith Gordon calls the "industrialization of agriculture" and its rich possibilities are plainly indicated by Ireland's soil, climate and proximity to markets. Vast reserves of peat, valuable coal and iron deposits and important water-power sites, the seaweeds of the western coasts, so rich in potash; the shipbuilding and manufacturing industries of Belfast, Dublin and Cork; the restoration of the ports of Galway, Waterford and Limerick to their old-time glories, all beckon to the ambitions and energies of a brave and industrious people at last enabled to possess their souls and their land in peace.

Wit of the "Wet" Variety

CHICAGO is a great city. The metropolis of the West, it is in point of population the second city in the United States. It is a great industrial and commercial center. More, the city is not without pretensions to artistic and literary culture. Its proud motto is, "I can and I will."

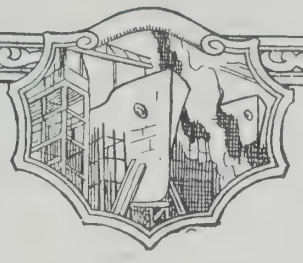
All these titles to pre-eminence seem likely to fade beside Chicago's swiftly accumulating reputation as the most lawless of American cities, and consequently the most un-American. Since the enactment of the prohibition amendment the city's shamelessness has been heralded far and wide by reports of brazen and flamboyant flouting of the law. Even the proverbial "tribute of vice to virtue," that of hypocritical pretense, is daily disregarded. A new police chief discovered that more than one-half his force was in league with the bootleggers. His endeavor to clean up this condition was distinctly discouraged.

The extreme to which this defiance of decency has gone is well illustrated in a recent official episode in which the municipality went on record. While Alderman John H. Lyle was speaking in behalf of a resolution putting the council on record as favoring the enforcement of the Volstead Act so long as it remains a law of the land, he reached for a glass of water. Gulping the contents of the glass, he nearly choked and hurriedly had to eject the liquid. He found that a colleague with a strange sense of humor, born of "wet" proclivities, had filled the glass with moonshine whisky. There was hilarity in the council over this "choking off the 'dry' oration." It amused them!

It is not surprising to find that the "city fathers" then "swept across" a "wet" resolution proposed as a substitute by another member, passing it "amid cheers" and by a vote of 52 to 4.

At least, there is a minority of four in Chicago's city council brave and decent enough to go on record as absolutely opposed to law violation. In fact, Alderman Lyle obtained a vote of 12 in favor of a second resolution favoring enforcement without indorsing the Volstead law itself, as against 47 opposed. This should prove a ray of hope in the approaching and irrepressible conflict between the forces that are blackening and those that would redeem Chicago's good name. The spring elections should rally the forces of decency in the Windy City. They can if they will!

Injustice of the Guaranty Clause



IN A SPEECH presenting his amendment to the railroad funding bill, Senator Kendrick, of Wyoming, exposed the iniquity of the guaranty clause in the Esch-Cummins act in very plain words. Under this amendment, the Interstate Commerce Commission would be relieved from the arbitrary requirement that, in fixing rates, they should fix such as would enable the roads to earn a fixed income of from five and one-half to six per cent. It would be made possible for the commission, in considering the transportation needs of the country, to have regard not only for the interests of the carriers, but also to pay heed to the needs of shippers and the rights of the general public.

"As the law stands today," said the Wyoming Senator, "with this guaranty clause in effect, the commission has no choice but to levy a toll upon all industry sufficient to pay the railroads a fixed profit, though every other industry in the land may operate at a loss." He went on to give figures that strikingly bear out his contention that the mandatory provisions of this section of the act resulted in disproportionately high freight rates, and so have contributed one of the greatest factors "to the desperate economic conditions in which the country now finds itself."

And he went on to show, the results of one such advance meant nothing less than financial ruin to producers in many sections of the West, in some places suspending the very processes of production. Scarcely a day goes by in which the attention of the Senate is not called to whole sections of the country in which the farmers are unable to move their products because the prices offered are not sufficient to pay the actual freight charges involved in reaching market. While the price of corn in Chicago in August last was only nine per cent above the 1913 level, freight rates were 84 per cent higher. Barley was 13 per cent higher, but freight rates 80 per cent.

Perhaps the most vividly convincing illustration of the effects of the freight increases was the Senator's statement that "it costs today $831 to ship a carload of wool from Boise, Idaho, to Boston, as against $75 in 1917," making it actually cheaper for the Idaho wool producer to ship to Portland, Oregon, and there rebill to Boston. This to get the low transcontinental rates which prevail between Pacific and Atlantic ports in order to meet water competition. This means hundreds of miles of extra and unnecessary transportation. "Uneconomical, if not absurd," is Senator Kendrick's pat characterization of a law compelling waste.

Mr. Ford's Page

THE question is sometimes asked whether in the course of change and readjustment which we are pursuing, there has not come also a change in our conception of government; or, if not that, whether government itself has not been thrust into another place in the redistribution of our emphasis upon life.

There was a time when the Government represented the head and center of all our interest, and the place of highest honor for men's ambitious desires. All the "big men" went into the government, and to be in connection with the government was to be regarded as a "big man." The government of that time was not any more able than is the government of this time, probably not nearly so able, and yet it represented in a way the terminal for nearly every sort of ability in the country.

We may account for this regard for government partly by the fact that until a comparatively recent time we were absorbed by the political aspect of the problems of life. For a surprisingly long period we entertained the notion in this country that as long as we had our political independence from Great Britain, as long as we were free to go to the ballot box, we had full enjoyment of the blessings of liberty. Soon, however, we saw that political independence was not everything. And when the economic question began to take form as a subject for our own deliberative action, we tacked it to the political conceptions we held and we believed for another long time that Congress could solve all economic difficulties by simply adjusting tariffs to meet the situation. Well, we had quite a long and varied experience with tariff fiddling until it was discovered that we were busying ourselves with something quite removed from the real source of the trouble.

All these disillusionments have not helped us to maintain the respect we formerly had for the political aspect of life. And when, after the war, politics and politicians had their magnificent opportunity at Versailles to justify their profession, and miserably failed, the glory of the political aspect seemed to have departed.

Why have these changes occurred? Principally because the purely political aspect of our problems has been outlived, and the men in political places have been unable to follow the problems to their new centers. The day is past when anything is started or settled by stump speeches, or party platforms, or bills in Congress. The orator, the declaimer of sentiments of "liberty" (meaning liberty from political domination by another government), the politician, in short, is a type that has passed. The day of the Doer has arrived.

Perhaps more than at any other period in our history the present time sees more responsiveness on the part of Congress to the will of people outside of Congress than ever before. The reason may not be especially flattering, but the fact is so. The reason is this: there was never a time when the problems were so big that a Congress could not handle them alone.

In other days—the days of what we may, for convenience, term the political era—there was always a group of men in Congress sufficiently authoritative to guide and direct Congress on any subject that should come before it. The so-called giants of the early days were only comparatively so—their problems were not nearly so big as the history books would make them appear. But, anyway, they were there, these men, competent for their tasks, even though those tasks were comparatively few in number, alike in nature and modest in their magnitude.

But nowadays there are a multitude of tasks, differing as widely as the world and of the most vital significance to many points of the people's life. What man or group of men is sufficient for them all? Hence the readiness of Congress to receive help from outside.

But when even outside there is no help! The Constitution, for example, gives Congress the right to decide money questions. We have no constitutional standard on the money question at all, it is entirely a Congressional standard which could be changed by succeeding Congresses at will. But, though Congress is made up of as capable men as will be found in the average of our higher ranges of useful citizenship, there would be a general confession among its members that on the Money Question they are as much at sea as are other citizens. When Congress wants to know anything about money it calls in the financial experts—those who are expert in the old system. And Congress can only act on the kind of information it gets, which is very likely to be the very kind of information best adapted to keep the old system from being seriously interfered with.

Maybe that is the reason why men leave public life with such readiness. Very few men find *political* public life to be a sufficient achievement to satisfy them as a career, unless they are of the orator type. The dissatisfaction with public life which many men feel is due to the fact that they are permitted to talk so much and accomplish so little.

That, however, could hardly explain the resignation of Postmaster-General Hays. He had a big job, a position where he could exercise authority and get things done. It was not necessary for him to make speeches and draw up bills and amendments and go through the heart-breaking process of convincing unconvincible men of the most obvious facts: he could simply do the thing, or have it done, the way he wanted it done. And his department was one in which the American people needed all the relief he could give them. He did succeed to a considerable extent.

But the ease with which men in high government positions revert to private employment, is just another sign of the times. It somehow seems that the opportunity for action which government offers is hardly big enough. Of course, there is the matter of remuneration also. But it startles us with the thought that if a banking house can bid for the services of the Secretary of the Treasury, and a motion picture combine can bid for the services of a Postmaster-General, what is to hinder some Society for the Preservation of Hygienic Cookery to bid for the services of the President of the United States some day, and get him, too!

We have seen almost everything but the resignation of a President to enter private employment. And many a time a President must feel hampered in doing the things that ought to be done—hampered in the first place by having been trained in the school of oratory instead of the school of action so that he does not know what to do nor how to do it, hampered in the second place by the difficulty of getting ideas through the minds of others who must give consent.

No doubt the movies need all the respectability that the name of Will Hays can bring to them, and no doubt Will Hays will need all of his respectability to keep what he has in the business he has undertaken. But if he can pull the movies out of the mud, if he can make them American, if he can drive out the men who are probably paying his salary and bring in men of character and cleanliness, he will have performed a big job, as big as the reformation of the postal service. Mr. Hays may have seen a great opportunity. It is there. But the perils are many. Let us hope that Mr. Hays pulls the movies out of the slime instead of letting them pull him in.

THERE is growing up a feeling among men who are conscious of the dignity of life that no job is worth doing unless it accomplishes something good, or helps to steady life or wisely reorganize it. Perhaps that is why government or political positions are held in less esteem than formerly, and are sought more by the oratorical, the social set, the leisurely. The old idea of office being an "honor" instead of an opportunity possesses them. This idea is flaming up for the last time. Men who want to do things are not hankering for office, because office is a hindrance to achievement. The day of the Doer is here; he will soon be in charge everywhere.

Germany's Peace-Time Invasion of America

She Fills Museum at Harvard with Replicas of Noted Art Works

By CARL SCHURZ LOWDEN

NOT long ago some of us had visions of a naval-aeronautic-military invasion from across the sea. Now there has been an invasion, but it is a peaceful one, without bloodshed and without the animosities that armed conflict engenders.

War is an awful monster, but sometimes he shows a sportive spirit with a sense of humor. He plays grim jokes and puts on little dramatic "asides" occasionally. Recently one of these pranks or episodes, begun several years ago at Harvard University, was terminated.

It was this way. German citizens and American citizens of German ancestry co-operated to establish a Germanic museum at Harvard. When the building had almost been finished replicas of famous German art and architecture were moved in. With everything ready for the opening to the public that event was indefinitely postponed. War had come.

"Ah, ha," War might have flaunted, "the joke is on you. When you are set for a grand scholastic flourish, I intervene and you stop. You are but my puppets. Give me room while I laugh."

"Well," you can imagine the custodian replied, "I guess I'd better put the key in my pocket and go home."

"You're right," War answered.

Anyhow, the custodian did just that very thing. He locked the doors, put the key in his pocket, and went home. The building that had never been formally opened remained closed to the public.

When Congress said "let us have peace," and issued a declaration to that effect, the situation soon changed. War was banished. With him out of the reckoning, the custodian returned and brought back his key. Soon the public was invited. It came and saw and appreciated this wonder-spot of medieval history.

Main entrance to the Germanic Museum of Harvard University.

The Germanic Museum at Harvard University is in the scope and quality of its exhibits a worthy counterpart of the Trocadero, the famous repository of French medieval sculpture. The building itself, designed by Professor Johann Bestelmeyer, of Berlin, stands as a specimen of the best in modern architecture. The construction work was supervised by the late Professor N. Langford Warren, of Harvard, who died during the war. Professor Kuno Francke, the originator or conceiver of the entire project, is the curator.

This home of German art contains three large halls whose names, Romanesque, Gothic and Renaissance, clearly indicate the nature of the contents thereof. Two additional spaces or sections are not large enough to be termed halls, and certain masterful works in these lose some of their highest appeal to mankind because they are dwarfed and stinted by their cramped setting. That is about the only fault that can be found with the building and the otherwise excellent display of antique art.

The visitor enters through Romanesque Hall. Perhaps he will see first the magnificent piece at the far end of this room. It is an impressive cast of the Golden Gate of Freiburg cathedral, and harks back to the prevailing forms of the thirteenth century.

The city of Hildesheim seems well represented. At the right of the entrance may be observed a replica of the choir screen from the Church of St. Michael and a cast of the Bernhard Column from the cathedral. On the other side are reproductions of the great bronze gates of Hildesheim and Augsburg cathedrals, also a cast of the baptismal font of the former.

All the pieces in this hall and throughout the museum are carefully tinted in the exact shade of the originals. One may look at the statues of St. Elizabeth (from a group of "The Visitation" in Baumberg cathedral), the Empress Kunigunde and all the extensive array of such art without feeling a sense of unreality; he does not wake up in the middle of the play, as it were, and lose the illusion.

Romanesque Hall is left behind when the visitor passes through the Golden Gate of the Freiburg cathedral and enters Gothic Hall, which architecturally represents the transept and choir of a medieval church. It is divided into halves. In the transept are casts of the east portal from the Church of our Lady at Trier, done in the thirteenth century; casts of the pulpit and crucifixion group in the Collegiate Church at Wechselberg of the same period, and a series of statues and reliefs from Strassburg cathedral.

The reproduction of the rood screen of Naumburg cathedral is the piece which, as it has a position corresponding with the original, cuts Gothic Hall into two parts. Together with the Golden Gate, it gives the effect of a cathedral choir in which are ranged about the sides images of the 12 apostles. At the farther end the visitor will discover the bishop's seat from the Ulm cathedral. One gets a general impression here of a great cathedral nave, due to the placing of the pieces in their present order; the whole arrangement gives a dignified, old-world impression that will not soon be forgotten.

In this section of the hall are numerous copies of tombs. It was the custom in medieval Europe to place a sculpture of the occupant of the tomb in a reclining position on its top. Thus may be seen casts of the tomb of St. Aurelia from St. Emeran monastery, also two others the same type.

The tomb of St. Sebald at Nuremberg, also in this division of Gothic Hall, is the work of Peter Vischer of the sixteenth century. So well did he make use of his bronze then that reproductions of his pieces are now rather plentiful in these exhibits in the Germanic Museum.

The replicas of the highly ornamental pieces of wood-carving, stone, and bronzes in the hall are wonderful examples of reproductive art, but probably no more wonderful than those elsewhere in the museum. Every bit of scroll, flowering and fluting is a painstaking imitation in form and color of the original, so well done, in fact, that the visitor can scarcely realize that he is not walking through the old, medieval cathedral itself.

Renaissance Hall, larger than either of the others, is nearly square, with a length of 80 feet and a width of 70 feet. It has a flat ceiling with square wooden panels in true pattern of the Renaissance period, supported by three columns of fine-veined red marble.

In the middle of the room are grouped the large Renaissance and modern monuments, with the smaller ones along the side aisles. The central piece is an equestrian statue of the Great Elector, taken from the one on the Schlossbruck at Berlin, by Andreas Schluter, of the seventeenth century. Directly opposite this, just off the balcony, is a cast of the tomb of Count Hermann of Henneburg and his wife (at Romhild, near Fulda), another work of the sixteenth century sculptor, Peter Vischer.

Ranged about the sides of the room are figures in armor. These include the Swiss Landsknecht, from the fountain at Schaffhausen and three celebrated personages from the Hofkirche of Innsbruck. The three show Theodoric the Great, Emperor Maximilian in the attitude of prayer, with arms upraised and opened palms together, and King Arthur, who has been often used as the subject of verse and prose. Vischer did the originals of Theodoric the Great and King Arthur, while Emperor Maximilian is the work of an unidentified pupil of the master. On the balcony floor stands a marble statue of Frederick the Great from the Provincial Diet Building at Stettin, by J. G. Schadow.

In this large hall one may feast his eyes on many fine high reliefs and reproductions from various famous bits of German art. One such represents the Town Weigher from the Municipal Custom House at Nuremberg, with Adam Kraft the sculptor thereof. Three beautiful pieces that may be seen here are details from the well-known triptych of Schleswig cathedral by Hans Bruggemann, who lived during the sixteenth century. The original, a huge work of a high order, has altogether 27 different scenes and 19 separate panels. Another high relief may be mentioned; it is a product of the fifteenth century from Nuremberg, and bears the title of "The Entombment."

On the wall opposite one may look on the funeral slab of Bishop John of Breslau, from the Breslau cathedral. It is another of Peter Vischer's works. The doorway leading from this hall to a smaller one, in which repose three large pieces of statuary and some photographic enlargements, also is a reproduction of the Renaissance period, as exemplified in the Hirschvogelsaal in Nuremberg. The outstanding work in the small hall reached through this doorway or passage is a life-size reproduction of "The Amazon" by August Kiss. The original of "The Amazon" can be seen in front of the New Museum at Berlin. Every detail of the replica is perfect. Indeed, it undoubtedly will keep the name of August Kiss alive throughout many decades and throughout many centuries.

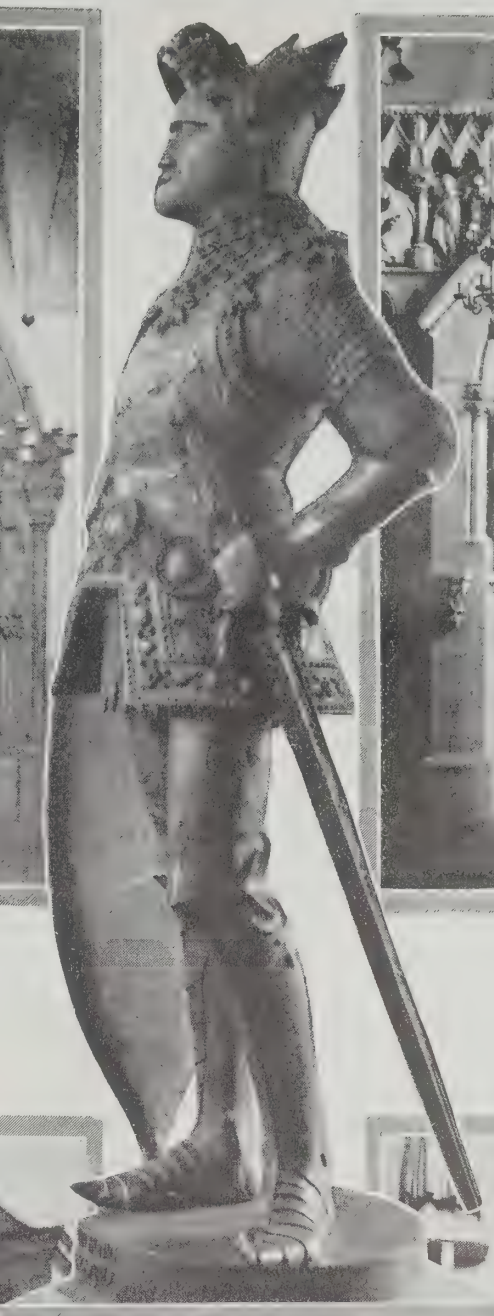
Now let's return to Renaissance Hall. There one will find much to interest him if he is a lover of art; and even if he is not, he will be interested, anyhow, provided he does not banish his normal mental receptivity and stubbornly close his eyes.

There are many glass cases containing electrotype reproductions of gold and silver services. Perhaps the most appealing is a part of the table service from the city of Luneburg; this has been contributed by a committee of scholars, artists, authors and other residents of the German capital. It numbers 17 of the best pieces.

Step over to another small room and you will see additional cases, one enclosing 21 pieces of the finest Romanesque, Gothic and Renaissance forms of cups and goblets. Here also is a fine collection of considerably more than 100 plaquettes in bronze by Peter Floetner, of the sixteenth century, and a set of reproductions from the Amerbach collection of plaquettes in the museum at Basel; this latter group numbers 28 in all, some quite large and the entire lot noteworthy because of the exquisite, painstaking wealth of detail that characterizes it.

There are, of course, many other pieces, but too numerous to mention specifically here. If I should single out one more, however, it would be the brilliantly wrought model of the Hohkonigsberg Castle, near Schledstadt, in Alsace. This great building was erected during the sixteenth century. The model impresses even the connoisseur of art and architecture as a splendid study of German castle structure.

In a small aperture, which leads from the balcony and overlooks the spacious Romanesque Hall, there stands a model of the famous Nydam boat, reduced in size, however, from the original that can be seen only in the Kiel Museum. There also are some replicas of a Roman legionary or an armed soldier, which was found in the neighborhood of Mainz, also a Frankish warrior, with arms of the Merovin epoch, and reliefs from the Marcus Aurelius column at Rome. The originals of the Roman legionary and of the Frankish warrior are in the Romisch-Germanisches Museum in the city of Mainz.



The entire building at Harvard University brings the Old World to the New; it not only brings the Old World, but it brings an old part of it. The esthete, entering it for the first time, immediately will fall under the spell or witchery of the artful and artistic displays and exhibits. The amateur, otherwise known as a tyro or beginner, may not have the gusto of a pig in clover when he looks on the relics; but assuredly no harm will come to him from directing his gaze toward these fine reproductions.

Golden Gate of the Freiburg Cathedral in Romanesque Hall.

A copy of the rood screen from Naumburg Cathedral.

The armored figure of King Arthur, in Renaissance Hall. Figures of Theodoric the Great and Emperor Maximilian also are in the hall.

A view from a corner of the courtyard showing a replica of the famous Brunswick Lion which was one of the earliest Germanic gifts to Harvard University.

A replica of the tomb of St. Sebald, in Nuremberg Cathedral.

"The Amazon," a life-size work by the German sculptor, August Kiss.

Your Daily Paper: the "News" It Serves You

American Newspapers Used to Spread Radical Propaganda; "Boring From Within" Methods at Sources Bring Results

By LEWIS HARPER

THROUGH a combination of circumstances, at once amusing and amazing, the newspapers of the United States are being used now, and have been used for years, to spread radical propaganda. This is just as true of the so-called conservative papers as it is of the avowedly progressive newspapers. It is not only unnoticed by the majority of readers, but only partly suspected by the owners of the press and its editorial personnel.

Most of this subtle communist infiltration of the news is the result of conscious "boring from within" by men and women occupying strategic positions where news originates or is distributed. Some of it is unconscious—the result of faulty education or circumstances and human elements which determine news content of the papers independently of anybody's purpose.

The work of planting propaganda in the newspapers is cleverly concealed by ceaseless denunciation of the "unfairness" of the "capitalist press" by the devotees of radical cults. This denunciation of the "capitalist press" is one of the most characteristic shibboleths of the Gospel according to St. Marx and also one of the most essential cogs in the machinery of disruptive propaganda. It is also the stock in trade of every political confidence man, or other demagogue, who makes impossible economic demands or political promises to hold a job through mass favor.

Press Plays Their Game

CURIOUSLY enough the principal medium for circulating the charges against the "capitalist press" is that same capitalist press! Indeed, a week rarely passes without the newspapers printing one or more attacks of this character. If they do this to expose the hollowness of the charges, they probably overestimate the critical faculties of the majority of newspaper readers because the significance of such publication is noted by few. Most readers fail to see that the charge is exploded by the fact that it is published by the accused.

Because the use of the "capitalist press" to exploit radical propaganda has become so general, there has been a change, mostly unnoticed, in the attacks on the press. Twenty years ago, when the socialist movement in America was insignificant and got scant attention in the newspapers, its writers and speakers constantly charged that a "conspiracy of silence" existed to suppress the facts about it.

That charge is rarely heard now. It has been superseded by the charge of unfairness and distortion. The old charge is no longer made because the radical today is successful in "putting across" his propaganda in the newspapers and gets so much publicity that suppression talk is out of the question.

The enemies of private property and the individual management of industry, the two cardinal institutions which differentiate the last few decades of human progress from the prior millenniums of crawling or stagnation, have had much the better of the publicity given to industrial disputes—both in quantity and quality—ever since the Lawrence textile strike. Measurement of the news content of the most conservative newspapers will show that in nearly every labor dispute the statements and proclamations of labor men are given more space than the utterances of the other side. Every reporter knows that the labor side is the more vocal. The employer as a rule does little talking. Neither, however, is a good publicity engineer. The employer usually fails to state his case fully or well. Often the labor leader falls into the error of issuing such lengthy statements that he defeats the object of reaching the public and when the mechanical necessities compel the curtailment of the statements it is attributed to a malicious intent to garble or mutilate the labor argument.

"Slipping It Over" Gets Space

THESE facts, of course, come into head-on collision with the metaphysical dogma of "economic determinism," one of the essential teachings and catchwords of socialism.

The devotee who views the world deductively and makes everything conform to the Marxian credos will say to this: "The idea is preposterous. Is it not perfectly obvious that the newspaper is an integral part of the industrial system? Are not the newspapers owned by men or corporations of great wealth? How can these institutions be employed to attack the industrial system of which they are a part?"

The answer to these "perfectly obvious" questions is contained in the news printed by the newspapers, which does consist very largely of attacks on the industrial system in one form or another. The reason is to be found in the methods by which news is generated and distributed.

The idea that the owner of a newspaper actually controls it in detail is a current delusion. Granted that he is a practical newspaper man on the job—and he very seldom is—his is only one brain working among many, and frequently against many.

If there are radicals or near radicals on his staff they find that "slipping it over on the boss" is not only easy, but has a fascination from the sporting element involved.

Often the newspaper owner is an absentee or a slow-moving corporation. It is frequently the case that the owner or the officials of the operating corporation are incapable, because of lack of editorial astuteness, to understand or detect the "pink" propaganda between the lines of their own news and editorial columns.

A prominent Chicago capitalist owns a morning paper in a western city. He fondly imagined that his paper was a bulwark of conservatism. It was supposed to be the staid and sober daily of the city in contrast to sensational and radical afternoon contemporaries. But the fact is that for several months in 1920 its editorials fairly reeked with parlor sovietism and other subtle propaganda, until the thing became a standing joke among newspaper men, while the publisher remained in blissful ignorance and probably hasn't heard of it yet.

A southern publisher who was in command of a regiment in France in 1918 and the early part of 1919 returned home to find that a woman editorial writer had turned his paper into a parlor Bolshevist organ, and his resident business manager had never suspected it.

But distortion and infiltration of propaganda which are sometimes practiced by employes are perhaps minor factors in giving a pink shading to the newspapers.

Some of the very largest publishers in the United States, and some of the largest distributors of wire news and features, are consciously and aggressively radical. They not only publish thinly disguised communist and syndicalist stuff in their own newspapers; but through their control of wire services and syndicate matter they get a large amount of this propaganda into newspapers which have directly contrary policies.

This is especially true of many smaller papers which do not have editorial staffs of sufficient size or sophistication to detect this propaganda and edit it out. They use it as it comes to them.

In regard to this class of publishers, who play the game for the radical element by spreading their ideas in one form or another, it is evident that they are dominated by mixed motives. The most important is the desire to attain popularity and circulation—the basis of all newspaper values—by the exploitation of real or imagined popular grievances. They reason that the mass of the people are not interested in the "property point of view," as they possess little or no property and are not sufficiently far-sighted, as a rule, to see that their own welfare is bound up with the institution of private property, no less than the prosperity of the actual possessors. Circulation values are mass values on the whole. Quantity counts.

Built Up by Such Methods

THE motive under consideration is, of course, the same motive that has inspired the political demagogue from the dawn of history. It is selfish, but men who act upon it have always had the faculty of clothing it in idealistic language and putting upon their opponents the stigma of materialism and self-seeking.

As a short cut to newspaper success, something can be said for it. There are many newspaper properties in the United States, the value of which has been created by this sort of appeal. On the other hand, fortunately, it has also been proved that circulation and newspaper values can be created by the slower, more difficult and expensive method of building up a reputation for accuracy and fairness. Such newspaper properties have proved to be more stable than the others.

It would be unjust, however, to assign self-seeking as the only motive dominating newspaper publishers who appeal to the disruptive instincts for circulation. The publisher is made of the same sort of clay as the reader. His education is frequently not superior. Undoubtedly these men have been sincere to a great extent. In the vernacular, "they believe their own stuff."

Much of their propaganda has been justified by temporary local and national conditions—but little of it has fruited in any actual results except their own prosperity. Where they have succeeded in dictating public policies the results have been disappointing, often disastrous. The only constructive results of their policies have been the enhancement of their newspaper properties.

This has resulted in no gain for the power or morale of the press. It is well known that circulation gains achieved by this kind of appeal are inevitably "cashed in" with a later advertising harvest, and that the radicalism of such news and editorial columns wanes in the same ratio that the advertising space increases. One reason for the comparative instability of such newspaper properties is that the gains and losses in circulation and advertising are intermittent. The two do not grow together as in more normal properties. Big circulation gains are usually achieved at the expense of some advertising loss and vice versa.

The publisher, however, has always before him this alternative route to success. To get a volume of circulation he may appeal to elements hostile to the modern industrial system. He can thus build his own business by attacking and imperiling the interests of other forms of industry. Were "Big Business" organized and alert as it is pictured by its enemies, such methods would, of course, be impractical, because business men, taking the long view, would refuse to buy advertising from such publishers—no matter how much temporary circulation they might have to sell. But neither Big Business nor little business is organized or class conscious, as is asserted by those who attack it.

No better proof of this need be adduced than the advertising columns of scores of newspapers which for the past few years have teemed with indiscriminate attacks on the packing industry, the railroads, the public utilities or the oil corporations and yet carry hundreds of thousands of dollars' worth of advertising from these sources.

The best illustration of the demagogic method of building newspaper properties is afforded by the war on the public utility corporations which has been raging for 30 years or more. The writer achieved very marked circulation gains in the editorial management of two afternoon papers, due principally to an aggressive attitude toward the traction companies in those cities.

This attitude was honestly assumed and the corporations had invited attack by their practices, but in retrospect, it appears that their sins and the circulation gains achieved by attacking them were out of all proportion to the just balance of news and editorial treatment. In other words, the evils attacked were insignificant compared to those which were ignored. Scores of newspapers in the United States have been made by fighting the utility corporations.

Formerly, many newspaper men regarded such a course as positive proof of the honesty of a newspaper or its publisher. The public utilities were rich and were supposed to be powerful. They were in fact never powerful, they only seemed to be, because they had the support of some professional politicians—the first to desert them when they found that the pickings were better on the other side of the plum tree.

The Defense of the Utilities

THE investors in these corporations were usually absentees and generally Americans of the "first settler" stocks. The utility corporations were not heavy advertisers, as they were natural monopolies. Their owners could exert no such racial or group pressure on the newspapers as is brought to bear when other kinds of business are subjected to attack—on the rare occasions when other big local interests are put on the editorial grill.

The native American has not learned to organize and act as a group in dealing with the press. Many of the newcomers bring such a capacity with them or speedily acquire it over here. The public utilities were rich, but when their legally fixed rates encountered the depreciated currency of the war period they became poor overnight. In this misfortune, of course, they differed no whit from plain individuals. Some newspapers are still seeking circulation by assailing and even nagging the public utilities. Politicians are still hounding them, and although they may be bankrupt thrice over and in the hands of harassed receivers, they still pay rich dividends to their enemies in the form of newspaper circulation and political jobs.

However, hostility to public utilities is becoming shopworn. The more sophisticated are becoming skeptical about public-utility baiting as a proof of public spirit or integrity. The people have begun to notice that *newspapers which have valiantly assailed the public utilities have been careful not to attack retail business throughout the era of high prices.* Profiteering in more homely forms has escaped the scrutiny and criticism which was heaped upon public utilities. The newspaper reading public has also become aware that it is easier and less expensive to lay the onus of high prices and other ills, that the public believes it is suffering, on the distant corporation managements or Wall Street than on folks nearer home.

"News" That Really Isn't

NATURALLY many newspaper men thus trained in the school of irresponsible attack have shown first-rate ability, both executive and editorial, and have gained positions of power and responsibility on other newspapers.

They have thus colored other newspapers with their original hue. Many have gained strategic positions in the press associations or have become staff correspondents who gather big news at the source and thus impart something of their personal viewpoint to news which is printed in hundreds of newspapers, many of them of directly contrary policies.

These publishers have also attracted into the newspaper business many men of restless minds and polemic ability who would not otherwise have entered it. Not a few of these in recent years have come from the newer arrivals from Eastern Europe and are naturally more disposed toward radical cults than the original individualistic American strains.

But the sources of propaganda are by no means confined to those circles. The most careful, conservative and conscientious publisher or editor is compelled to print a great deal of stuff of a misleading tendency simply because it is "news" or appears to be "news." Some of it is "loaded"—some of it has no other significance than that of creating false impression by being printed at all, and thus giving importance to things of no real importance.

News content may be made partisan by quantitative methods without coloring or comment. If the newspapers can be induced to carry enough news of a given sort, they will do the work of the propagandist. The press agent's art is nowhere better developed than among the devotees of the radical cult.

Casting New Lincolns From the Original Mold

By ROBERT H. MOULTON

Woolen mills at Cumberland Gap. Here are made unique coverlets in the "Whig Rose" and other antique patterns.

A MILE and a half south of the stone that marks the meeting of Kentucky, Tennessee and Virginia, there is a little college that puts two pertinent questions squarely to the American people:

Is it worth while to make an American out of an American boy?

Is there any justification for educating an American girl?

The log cabin has been the first shelter of many an American who has boasted of humble heritage, and of many great Americans of whom America, with justifiable pride, has boasted. But our fertile fields, vast forests and exhaustless mines have made the pioneer of threescore years ago affluent today; have made us a nation of unparalleled wealth; have converted America into a vast country of productive farms and rich cities, humming factories and smoking mills, with a cobweb-like network of arteries of transportation and communication.

Philanthropic interest in education has turned its attention to the immigrants and not the native-born, to the melting pot and not to the log cabin, for the log cabin seemed gone and is gone but for the Appalachian range which, when the western course of empire took its way, was hurled over and forgotten.

Our cities are filled with worthy philanthropic societies, maintained by the commendable charity of philanthropic folk. These societies are operating through trained, highly paid and specialized social workers for the uplift of the Sicilian and Turk, the Greek and Portuguese. Into this melting pot they put the new arrival on our shores, hoping to make "an American"—all the while forgetting that in the cabin homes up and down the great Appalachian valleys there is the real American, waiting to be Americanized. Shall we forget him?

Lincoln did not.

More than a score of years have come and gone since General Oliver Otis Howard, catching his inspiration from the lips of Lincoln, founded a remarkable college in the midst of the Appalachian Mountains, at Cumberland Gap, Tennessee. He called it the Lincoln Memorial University. He might have called it the "University for Lost Americans," for its mission is that of pointing the way to progress for pure-blooded American youths who, though descended from the pioneers who settled in the southern mountains before the Revolution, are hemmed in, isolated, out of step with the world, living under virtually the same primitive conditions as did their forbears. Several million people reside in this region of the United States. Their customs, speech, and manners are those of Daniel Boone; their outlook on life little changed from the days when Lincoln was a boy. So the Lincoln type is still there. The mountains that looked on his early struggles for an education might tell of other battles against poverty and circumstance of birth being waged today by just such mountain youths.

The School of Music.

Above—A group of students. Left—Grant-Lee Hall. The old Grant-Lee was burned in 1909. Now being rebuilt.

These youths form the student body of Lincoln Memorial University, which is one of the most dramatic and democratic institutions of learning to be found in this country. In the depth of its appeal to its student body it is perhaps the greatest university in the world. Lincoln Memorial is the kind of a college Abraham Lincoln would have wanted it to be. It is a university where every student works, not only with his brain, but with his hands. The gymnasium of Lincoln Memorial is the open field and the out-of-doors. The men who get their education at this school earn it and pay for it day by day. Not a young man or a young woman at Lincoln Memorial has any time for daydreams or frivolity, nor any inclination, apparently, to indulge in them. The faculty is devoted, the students are in deadly earnest, and the result is more work and more accomplishment per minute and per term than anywhere else.

It is the kind of college Lincoln would have chosen to attend. The boys are his kind of boys, high-principled, clean-cut, upstanding six-footers, clear-eyed and keen, quiet, fearless and courageous. And there is nothing in the way of sacrifice too great for them to endure for the sake of an education. What some of them have already done to reach the gates of Lincoln Memorial would make an epic. They come from 200 miles around, with their "little all" in a bundle, now and then a few dollars at the most, but in the majority of cases nothing, to fight their way through school.

Not long ago a young fellow, carrying a small handbag arrived at the university. He had walked 50 miles to get there. But the college was full.

"I'm sorry, my boy," said the dean. "I'd like to take you in, but we just haven't any place to put you—there's neither a room nor a bed."

"I didn't come here to get a room, I didn't come here to get a bed," said the tall, slender youth. "I came here to get an education; I can sleep on the floor."

You can't turn that kind of boy away. He won't be turned away. He wasn't turned away. He's waiting on the table, working in the laundry, working in the field, doing anything, everything. A few weeks later he was asked, "How do you like it here?"

"Like it," he repeated with a curious smile. "Why, it's just grand."

"And what do you want to do? What is your ambition?"

"Why," he said in a confidential tone, "I want to do so much I don't dare tell the people here. They'd think I was foolish. I'm a southern boy; I love the South, and I want to be a writer. I want to tell the stories that I know of these people in the mountains. When I'm through here I want to go to Harvard, where they train men to write. I want to climb up the ladder of culture. I don't dare tell 'em here yet, but that's what I'm going to do."

One of its professors who came to the Gap from Connecticut, a graduate of Columbia University, said: "I am here because I don't know of any place in the United States where a boy or girl can get so much education for a dollar."

Some students under this professor matched their learning in chemistry, acquired with pitiably limited laboratory facilities, with that of some upper-class men in a state university of recognized standing some several hundred miles away, and found that they could write a better examination than the students from the well-equipped college. "It's the will in these boys and girls," said the professor, "which makes up for the laboratory limitations."

Here about the Gap is the neglected corner of the United States. In the hundreds of square miles around that mountain region of Kentucky, Virginia, Tennessee and South Carolina, are tens of thousands of children whose Americanism is traceable through possibly half a dozen generations or better, and whose homes are squalid cabins. They have been stranded in the hills where the railroads have not yet reached. Though ignorant and poor, they are industrious, honest and eager. Give them half a chance and they'll make big use of it. That is what Lincoln Memorial is trying to do. On its beautiful farm the students gather the tomatoes and potatoes, and harvest grain which they themselves sow, plant and cultivate.

The university has recently built and equipped near its spacious dairy barn, which was built by the students, a thoroughly modern creamery. It hopes soon to have a thoroughly equipped cheese factory. These institutions do more than give trade instruction to the students; they give the students work, and make it possible for them by that work to get the trade instruction. The market for all the butter and cheese they can make is there.

The inventive talent of the boy at Lincoln Memorial is cultivated. He is taught to think in concrete terms, to put his ideas on paper, to draw out his plan so that he or any builder can make real his dream. The boy who leaves this university may not have the technique of the draftsman from the highly developed architectural college, but he can do what perhaps the more perfect draftsman cannot do—he can lay down the plans for a good house, a serviceable barn, a well-arranged community creamery, a silo, or a steel bridge to span a rushing brook, and then turn out himself and build it.

The boys at Lincoln Memorial are not only taught practical mechanical drawing, real carpentry, honor-bright masonry, stone-setting and bricklaying, but they are taught to make things in the carpentry shop—bookcases, bureaus, washstands, desks, chairs, tables—things that must stand up, not to pass the percentage count of the professor, but stand the test of the market itself. They are made to take to the market to sell, to bring the maker profit—something to help the maker through college. That's the test. And it is the test that will stand trial after the student has left the guiding hand of the professor.

The valleys that lie between the coal and iron-laden mountain ranges around Cumberland Gap are rich in virgin soil and form one of the best sections in the United States for diversified farming, particularly for dairy and fruit farming. Aside from this very practical instruction in the science and elements of agriculture, in animal husbandry, agricultural chemistry, dairying, bacteriology, agronomy and the like, the student, by catalog requirement, is obliged to follow the plow on the 700-acre university farm, nor can he leave the tillage of the field until it is disked, rolled, harrowed, sowed or drilled. He is required to mow grass, rake hay, build stacks, pitch and load wagons; reap grain, and shock it; drop corn, cultivate it, cut it, shock it, husk it and shell it. His acquaintance with the horse is made through the curry-comb and harness, as well as the grain bin, the hay-stack and the straw stack. He doesn't learn how to drive, unharness and bed a horse by sitting at his desk looking at a chart or blackboard; he doesn't sit in a milking clinic to watch a white-liveried milker do the milking. He is given a cow, a milking stool and a bucket, and told to come back with the milk.

Lincoln Memorial recognizes, as everyone is forced to, that the women have taken their place in the industrial world, that they are essential to it, and that they must be fitted for it. To this end, stenography, typewriting, bookkeeping and such other courses as are helpful in the commercial activities, are taught in that practical way which makes it possible, at times, for these students to convert their experience under instructors into cash.

The university also recognizes the fact that in spite of the new industrial era, in spite of the modern methods of food preparation, which send out much of our food factory-prepared, there still is, and for a long time to come will be, need of women skilled in the old-fashioned, homely and wholesome art of home-making. To this end the institution conducts practical courses in household management, cooking, home hygiene, and those pursuits that are usually cataloged under the general head of "domestic science."

But in this line of work sewing seems to be about the only vocational training which makes it possible for the girls to earn much money while attending school. The university does not like to *give* these girls an education. These mountain folk are full of pride, and they don't like to be given things. What the university wants to do is show them how they themselves may get the education. And they can earn enough money to educate themselves by sewing, by making things. That's why a lot of sewing machines are always in use. Responding to the needs of its nearest metropolis, Knoxville, the university has built a most creditable hospital of 75 beds, a well-equipped bacteriological laboratory, and a thoroughly efficient, standard training school for nurses with a three-years' course.

The life lesson of Lincoln is the old, old lesson—that what we do that is worth doing in the world can help us only because it helps others. That is the spirit of the college at Cumberland Gap.

Mining Towns Are Not Always Unsightly

By ROSS B. JOHNSTON

DIRT and ugliness have so long been associated in the minds of most of us with coal mining towns that we can scarcely think of a mining town in terms of cleanliness and beauty. But the United States Coal & Coke Company, at its dozen mines in the Tug River section at Gary, West Virginia, and at Lynch, Kentucky, has proved that mining towns can be attractive.

Along with the things that are ordinarily grouped under welfare work by other companies, this company has taken up sanitation as one of the prime factors in the betterment of a community. To insure sanitation, it has been found much easier here to advocate the planting of gardens than to preach sanitation. The officials know that people are just like the things thrown around them. The man whose home is dirty, family unkempt, and food unclean and badly cooked, is generally dissatisfied. He is not only discontented but a poor workman as well. On the other hand, the man who is clean and whose surroundings are fresh and attractive, is generally healthier, happier, and a better workman. So the company feels that it is a good investment for itself, as well as a boon to the men in its service, to make their villages models.

There are concrete walks on the streets and right up to the doors of its employes. Concrete streets connect the various towns.

Stone walls are built to hold sloping hillsides. Low places are filled. Every possible effort is made to eliminate tin cans, dirt and all waste and refuse that might collect. Garbage is collected daily. It is then a logical step to promote gardens—flower and vegetable gardens, with grapevines and other clinging vines about the homes. The attractiveness of the various little towns is indicated by the photos of houses, streets and gardens that accompany this article.

The houses of the poorest miner are of the same material as those of the highest paid officials. That material is wood, although there is so much stone quarried out of the steep hillsides that it is often a problem to know where to use it. But frame has been used for residences since the opening of the mines and with success. The houses are neat and attractive, of varied design. All are painted, various color schemes being used to eliminate monotony. Water comes from deep wells and it is filtrated before it reaches the homes.

Houses that cost the company $7,500 to $8,000 have four rooms on two sides with bath, electric lights and water-heating system. These houses rent for $26 a month for each side.

Double "102" houses, three rooms down and two up on each side, but without so many modern conveniences, may rent as low as $7.50. Double "6" houses, three rooms on each side, may rent as low as $6 a month. The older type of house is maintained at a loss. All the newer houses have hot water, heat, electric lights and baths. The tendency is to group the houses around a central heating plant in the future for the sake of convenience and economy.

Above—These attractive little houses are the kind that help hold miners. Below—A typical coal-town street. Stone retaining wall, concrete roadway, concrete sidewalk, painted houses with vine-clad porches and flower-decked yards.

The men do not need to go home unwashed from their work in the mines. At every mine there is being built a commodious wash room, where the men can clean up before going home. There are lockers of the new type in which each man ties his clothes to a ring, pulls this ring up with a cord until the clothes are out of the way in a case against the ceiling, then locks the other end of the cord to a rail within easy reach. When the miner leaves home in the morning, he may be dressed as well as any business man. He goes into the locker room, undresses, puts his good clothes in the locker, and dons his mining clothes. After the day's work, he removes his working clothes, takes a hot shower, tops this off with a cold shower, and puts on his street clothes. When he gets home, he is ready to sit down to the supper that awaits him, in clean clothes instead of in his soiled mining clothes. What that means only a miner or a miner's wife can know.

Gardens perch on the hillsides and on every bare spot down in the valleys. There are no "dumps" because all vacant land is in gardens. Flowers compete with vegetables for places in these gardens, but liberal prizes offered by the company for the best gardens have often brought about a combination, in which the flowers form borders for the utilitarian vegetables.

Who do you suppose insists on a garden in connection with his home, the native-born, the foreign-born or the Negro? It is the foreign-born who is never without a garden. But there are few families that were without their gardens in recent years, and the garden work has become the most important and the most interesting feature of these towns, outside of the actual production of more coal than any mining company in the state. The gardens are all neatly fenced in to keep out stray animals, as well as to beautify the premises and give a feeling of privacy. It has been the garden that has been the most important factor in solving the problem of neat premises and general cleanliness of the towns.

The schools, churches, clubs, stores, athletics, hospitals and so on are far above those found in most welfare efforts.

Conquering the Hessian Fly

ARMY sanitary methods a century and a half ago, were not what they are today. Wheat straw, brought from Germany by Hessian soldiers, who came to America to fight the colonists, was scattered about the camps. Later the wind carried it to near-by farms.

In that straw, entomologists say, the colonists might have observed small, hard, brown objects, resembling flaxseeds.

In early spring and autumn startling changes might have been observed in the flaxseeds. There was a pronounced disturbance in the shell. A hole appeared at one end. A small insect pulled itself out by stages and before long flew to where the colonists had planted wheat.

There it soon was joined by other insects, also travelers in the Hessian bedding roll from the old home in Germany. They mated. Soon afterward the female began depositing eggs on the first blades of tender wheat.

The eggs were oval and generally three were placed on a blade. Sometimes there were many more. The insect didn't stop until it had laid from 100 to 107 such eggs.

Three to five days later the eggs gave forth tiny red worms that wriggled down between the leaf sheath and the stalk. They continued downward until they found a location just under the ground. There they fed and grew. Other changes occurred and the next season the process just described was repeated.

That is the story of the introduction into America of the Hessian fly. It takes the largest toll of any insect that attacks wheat. In 1916, according to Federal estimates, it reduced the wheat yield 37,000,000 bushels. From the beginning in the East in Revolutionary days the insects spread to various sections. Now it is found chiefly from the eastern boundary of Ohio to the western section of Kansas. Tennessee and Kentucky also suffer losses due to the fly.

The average yearly loss in the nation, due to fly damage, is estimated by the same authority at 13,000,000 bushels.

Because, possibly, of the standing of Kansas as a wheat-growing state, the damage in the nation usually reflected conditions in Kansas. In 1916, the year the national loss was 37,000,000 bushels, the Kansas loss exceeded 8,000,000 bushels.

But the 1916 loss was not the largest in Kansas. Several years earlier it had been noted that Hessian fly damage was increasing there. In 1907 the loss amounted to 10,000,000 bushels.

When the loss in a single state amounted to 10,000,000 bushels it was recognized that methods of fly control then in use had failed.

F. M. Webster, representing the United States Department of Agriculture went to Kansas. There he conferred with E. A. Popenoe, of the Kansas State Agricultural College, about new methods of fighting the insects. They decided that the Department of Agriculture and the college would co-operate in experimnts.

E. G. Kelly, representing the department, was given charge of the work and the experiments began. Wheat was planted under varying conditions. Farmers' fields were studied. A route was established from Salina, Kansas, to Medford, Oklahoma. It was covered by Kelly and his assistants every year for five years. Sometimes several trips were made each year. Meanwhile the fly-free date was more clearly established in the various localities and farmers were urged to plant about that time. But losses continued heavy. Kelly had been at work eight years, seeking the new methods, when the disaster of 1916 occurred. He was discouraged. Apparently he was no nearer a solution than when he began in 1908.

"I knew some fields in the fly districts didn't have flies," he said, "but I didn't know why."

Such were conditions when Kelly stood one day in 1916 on the farm of Ed Laney in Sumner County, Kansas. The sun blazed down and the stubble seemed to give off heat like a furnace. A "hunch" came to Kelly that deep plowing would eliminate the Hessian fly.

"Bury the stubble so deep the fly can't get out," was the inspiration.

Kelly took a mental journey back to the fly-free fields he had visited and studied. He could not remember any but those that had been plowed deeply.

Laney consented to plant part of his field in experiment plots as Kelly suggested.

Part of the field was disked deeply, part lightly and part was not disked. Some was plowed deep, some shallow. Boxes three feet wide and six feet long were placed open side down in each plot. In the walls were placed glass tubes, extending outward. Similar experiments were made on other farms. And Kansas farmers were urged to plow their wheat land deep.

At last the boxes were inspected. Where the plowing had been less than four inches deep and where bits of stubble were on the surface, flies were plentiful. They had come out of their hiding places just under the soil in the stubble and gone into the glass tubes, leading toward the light, seeking liberty.

The boxes on land plowed five inches deep showed only a few flies. Where the plowing was six inches deep there were no flies.

"I knew, then, I had the secret," Kelly said. "But I was determined to guard against a fluke, so I preached deep plowing and continued experiments without making any announcement."

The spring of 1917 came and with it the war. Because it was war time farmers gave more attention than usual to crop suggestions. Meeting after meeting was held, at which speakers told farmers deep plowing would eliminate the toll of a pest that came from Germany. Groups of men were taken to demonstration fields and shown the fly and its work. The farmers were taught to pick out the infested plants. There was some fly damage that year and attention was directed to it on every occasion.

"In 1918, with the greatest wheat acreage in her history," Kelly said, "Kansas was 'ripe' for heavy losses due to the fly. Yet the crop harvested that year virtually was free from fly damage."

The plea for deep plowing was continued in the succeeding months and the 1919 crop, too, virtually was free from fly damage. In 1920, when there was damage in other states, Kansas again escaped loss.

Adding reports this year to that good record, Kelly decided his theory had stood the test. An announcement was made at the college that the Hessian fly had been eliminated as a crop factor in Kansas.

Kelly has left the Department of Agriculture and devotes his entire time to Kansas agricultural extension work.

KNUT HAMSUN

Knut Hamsun Fights to Fame Through Hunger, Poverty

By FRED L. HOLMES

SOME 30 years ago Knut Hamsun, an unknown Norwegian immigrant, was discharged as a street car conductor in Chicago because he could not remember to call streets. One year ago, as an author, he was awarded the Nobel prize for literature.

Within those years there has grown up in America a legendary history of the movements, the eccentricities and the oddities of this cobbler, coal heaver, farm hand, fisherman, preacher and lecturer. Every adversity has come to him. He has had to make the fiercest struggles for bare existence. His books are tinged with autobiographical tragedy.

It was after he had been discharged as a street car conductor that he returned to Norway and wrote his first novel—wrote it with the stub of a pencil as if it were a compact with death. He called it "Hunger," because he was starving day by day as it was written. When he could bear the scene no longer, and when the end seemed to him inevitable, he took his soiled and disjointed manuscript to a publisher. It was accepted and brought food. What is more, it brought instant recognition as a writer in the Scandinavian countries.

When the announcement was made that Knut Hamsun had been awarded the Nobel prize, literary America sat up and rubbed its eyes in Rip Van Winkle wonderment. Surely the Nobel prize was never intended for such an unknown author. Was it possible that Nobel had intended that his gift should go to some one scarcely heard of in literary America?

Who was Hamsun and what had he written to bring fame? Hamsun's life and writings are inseparably bound together. He has expressed himself in fiction, verse and drama—it is all autobiographical. He was born August 4, 1860, at Lom, in Gudrandadal, about 100 miles north of Christiania, of peasant parents. He was taken at four to Lofoten Islands, but the boy did not relish the life of the fisher folk. Later he was apprenticed to a shoemaker and at 17 years blossomed forth with a long story and poem, "Bjorger" that tells how a poor farm boy was left an orphan. It was the beginning of his own autobiography. He published this book himself, but it brought no recognition.

He Acted on Bjornson's Suggestion

SOMEHOW he had become acquainted with the distinguished Norwegian author, Bjornstjerne Bjornson. The latter had suggested that there might be a field writing poetry for the Norwegians of America, since two-thirds of the Norwegians of the world live in Wisconsin, Iowa, Minnesota and the Dakotas. Bjornson gave a letter of introduction to Professor Rasmus B. Anderson, a well-known Scandinavian-American, professor of Scandinavian languages at the University of Wisconsin, and later United States minister to Denmark. So Hamsun came to America.

"One day during the summer of 1882, while my family and I were at the dinner table in Madison, Wisconsin, we heard the door bell ring," related Mr. Anderson. "On opening the door there stood before me a tall, slender, smooth-faced young man with a large growth of hair on his head. You could not look at this youth with a forest of brown hair without thinking of Bjornstjerne Bjornson in his palmiest days. This young man held his hat in one hand, and with the other he handed me a letter. I opened the letter and found it was written to me by no less a personage than Bjornson himself.

"In this letter Bjornson said in substance that he herewith sends to me a young man named 'Knud Pederson.' He adds that 'he is not without literary talent' and requests me to take an interest in him and do what I can for him.

"I asked 'Knud Pederson' what he intended to do in this country. He replied: 'I have come to write poetry for the Norwegians in America. Bjornson told me this country needed a poet, and I have come to supply this want.'

"He told me he had not attended any but elementary schools; that he had done various kinds of work and that for a time he clerked in a store in Gjovik, on Mjosen. He had written some poems, some of which had appeared in print, and told me how he at one time, when King Oscar was in Christiania, had gone to the palace and asked for an audience. He did not succeed in seeing the king, but he was able through the chamberlain to hand his majesty a couple of poems. By the chamberlain, King Oscar had sent him ten crowns (about $2.50).

"I tried to impress on my new friend that I did not think he could make a living by writing poetry for the Norwegian-Americans, and suggested that he had better make use of his Brage-gift as a side line; but he insisted that he had an inner call and that Bjornson had assured him that such a field was open among his countrymen here.

"About that time I was in the midst of my agitation in the Norwegian press urging all Norwegians wherever it was possible to drop their names of 'Olson,' 'Larson,' 'Johnson,' 'Peterson,' and the whole aggregation of 'sons,' and substitute the name of the farm from which they or their families came in Norway.

"After dinner I asked Pederson whether he did not have a farm name he could use. I told him that the Pedersons were so numerous it would be difficult to acquire enough reputation for identification. He said his family had lived on a farm named 'Hamsund.' I advised him to drop 'Pederson' and call himself 'Knut Hamsund.' This advice he at once accepted.

"I had lately met a Norwegian merchant in Elroy, Wisconsin, and understood that he needed a clerk. As Hamsund had some experience in this line, I sent him to my friend there. Hamsund was accepted and for a while seemed to give satisfaction, but after some time he began turning up later and later at the store in the morning. He seemed to have spent his nights writing poetry and so overslept in the morning. The merchant finally was forced to dismiss Hamsund for tardiness. Hamsund then came back to Madison and I had him on my hands again.

Thought He Could Be a Preacher

"KRISTOFER JANSON had been successful in Minneapolis and his church at Madelia, Minnesota, had been organized. He was getting more work than he could do and his church was growing. He needed assistance. He therefore wrote to me and requested me to find for him some bright student at the University of Wisconsin that he might prepare for the Unitarian ministry. I had not found any one, but I had Knut Hamsund on my hands. I asked Hamsund (he later dropped the 'd' in his name) how he would like to become a Unitarian preacher. I do not think he had the slightest idea of the meaning of the word 'Unitarian,' but he replied that he was sure he had in him the making of an excellent preacher, and he was willing to go and live with Janson in Minneapolis.

"Janson gave Hamsun daily lessons in Unitarian theology. Hamsun was appointed a teacher in Janson's Sunday school and before long he was permitted to occupy the pulpit in Minneapolis when Janson himself had to preach in Madelia, Minnesota, or in Hudson, Wisconsin. I once heard Hamsun preach, but I must confess that I did not have the slightest idea of what he talked about.

"Hamsun was industrious, but he was in failing health. In the spring of 1885 he had to take to his bed. About that time I visited Minneapolis shortly before I started on my mission as minister to Denmark. I found Knut Hamsun sick and utterly despondent. He told me he had quick consumption and did not have many more days to live.

"I told Hamsun he was not as sick as he thought, but he would talk of nothing but death. He said he did not fear to die. One wish was uppermost in his mind and that was to get back to Norway so he could be buried beneath Norwegian soil. If he, contrary to his expectation, should get his health back, he would devote the rest of his days to the spreading of the kingdom of God among his fellow-men. I gathered enough money to defray his expenses to Norway. With this money he started at once on his journey home. When he got back to Norway, his health improved rapidly."

"Was that the last you heard of Hamsun?" Professor Anderson was asked as he paused in his story.

The aged scholar smiled and said that in two years Hamsun was again back in the United States working as a farm hand in the wheat fields of North Dakota, as a free-lance journalist and then as conductor on one of the horse-car lines in Chicago. Dr. Andres Doe, one of the prominent Norwegian residents of Chicago, pictures Hamsun at that time as "out-at-the-elbows." Horses pulled the cars and Hamsun stood on the back platform reading books—Aristotle and Thackeray. He forgot to discharge the passengers at their corners and would stop in the middle of the block to let off some rheumatic woman. Protests came to the traction company and Hamsun was dismissed. He again returned to Norway.

"I saw Hamsun again on one of my late visits to Norway while still United States minister," continued Mr. Anderson. "He said he had written a book and was on his way to Copenhagen to find a publisher. He then produced from a dilapidated satchel a huge mass om manuscript, enough, it seemed to me, to make a book of 1,000 pages. The manuscript consisted of paper of every description and color and was in the same condition as his apparel and satchel.

"How he lived in Copenhagen I do not know; but, of course, he soon got out of funds; nobody would purchase his manuscript. I suppose the publishers knew he was an anarchist. His case was desperate.

"'Be an author and live in a garret' became literally true in his case. He found a small garret near St. Hans Torv (St. John's Market) and paid his last copper for rent; he had nothing left for food. He had to go hungry. At the end of each day he put down on paper all the sensations he experienced from hunger. From day to day the inward cries for bread became louder. How many days he lived without food I do not know; but his manuscript contained a faithful record of his sufferings. Finally he wrote as a heading, or title, in big letters the word 'Sult' (Hunger), put the manuscript in his pocket and managed to get back into the city, where he entered like a ghost into the sanctum of the publisher Hauberg and placed 'Sult' on the table before him. Hauberg was astonished. He looked at the word 'Sult' and at the emaciated man before him. He pitied him. He gave the manuscript to the editor of the great magazine *Ny Jord* (Virgin Soil), of which he was the publisher, and the result was that Hamsun received a good price for his manuscript. The story appeared in the next issue of the magazine.

His Hunger Story Brought Fame

"THE publication of 'Sult' made Hamsun the lion of the day, not only in Copenhagen, but also in Norway and to a considerable extent in Sweden. He became at once the most talked-of personality in all Scandinavia. The story in the magazine was the first chapter of what was afterward extended into a large book.

"When it was learned that he was living in a garret at St. Hans Torv the distinguished authors of the city, such as Georg Brandes, Erik Skram and others looked him up. They found this skeleton Knut Hamsun, who is more than six feet tall. Hamsun's success was established. He had made his fame in a day."

Since then Hamsun has written approximately 25 volumes, and his works have been translated into 23 languages. "Hunger" was followed by a long series of novels, dramas and essays. The best known of his novels are "Mystery," "Pan," "Editor Lynge," "Victoria," "Shallow Soil," "Children of the Time" and "The Growth of the Soil." Most of these have been translated into English. His first play (1895) was "At the Gates of the Kingdom," followed by "The Game of Life" and "Sunset Glow." These constituted a trilogy, and the hero of all three is Ivar Kareno, a student and thinker. Later plays were "Vendt, The Monk," "Queen Tamara" and "At the Mercy of Life." His book on "American Culture" was published following "Hunger." It portrayed Americans as slaves to two gods—Mammon and Humbug. Since then the author declares he has changed his views and that the book "has ceased to represent my opinion of America."

"The Growth of the Soil" glorifies the life of the soil. It was probable that for this story, idealistic in some of the chapters, Hamsun was granted the Nobel prize.

The Nobel Prize

IN RECENT years Hamsun has made his home on an estate in Southern Norway, always keeping close to the soil; in this country rich in its mountains, ice fields, waterfalls and fjords and famed for its midnight sun.

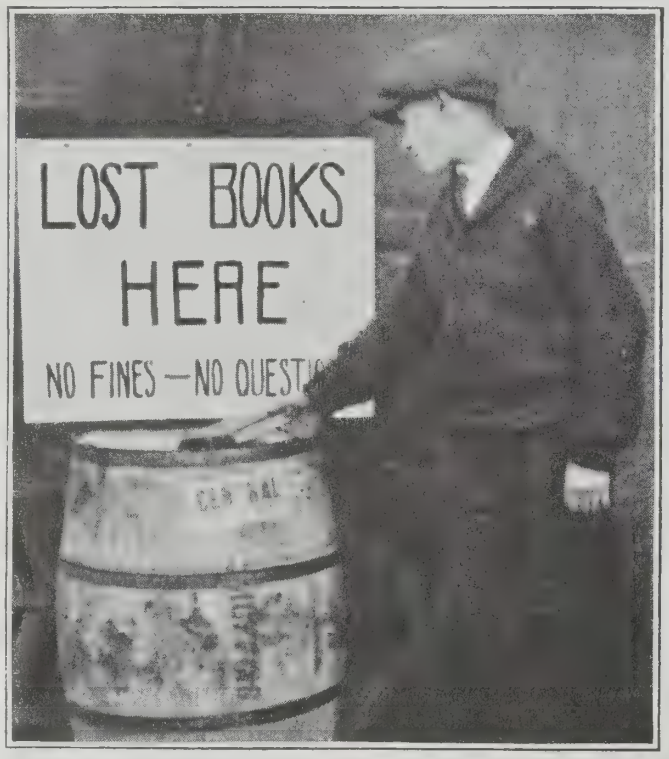
It was to this peasant writer, eccentric, dreamy, almost erratic, that the Nobel literary prize was given.

What is the Nobel prize?

More than 20 years ago Alfred Bernhardt Nobel, a Swedish inventor, most widely known for his invention of dynamite, bequeathed $9,000,000, the income from which was to be annually distributed in five equal prizes, the first three of which were to be awarded for the most important invention and improvement in physics, chemistry and medicine; the fourth, to a person in society, who during the year preceding the award had rendered the greatest service to the furtherance of international brotherhood, and the fifth, to the person who produced the most remarkable of idealistic character in the world of letters. Each prize amounts to about $40,000. The first prizes were awarded in December, 1901. Four Americans have received prizes: Theodore Roosevelt, in 1906, for his work for universal peace; A. A. Michelson, of the University of Chicago, in 1907, in physics; in 1912 Dr. Alexis Carrel, of the Rockefeller Institute, in medicine, and in 1912 to Elihu Root for his efforts for peace.

No American has yet won the literary prize. Among those who have won the literary laurel have been the poets, Sully-Prudhomme, Mistral, Echegaray, Carducci, Maeterlinck, Hauptman and Tagore; the novelist, Bjornson, Sienkiewicz, Kipling, Heyse, Selma Lagerlof and Anatole France; the historian, Mommsen, and the philosopher, Encken.

And now Hamsun, the former street car conductor, fisherman and farm hand—no longer hungry—has joined this literary galaxy.



A City Has A Home-Coming Week for Book Waifs

By THOMAS J. MALONE

"FOUND in a boarding house"; "left by a maid"; "left at my store"; "in attic of our house when we moved in." These are typical of explanations offered by returners of overdue and otherwise delinquent books in a "Bargain Week" conducted by the Minneapolis Public Library. Though Cleveland had given a one-day trial to a similar resort, at its central library only, and several small cities, as Fargo, North Dakota and Mankato, Minnesota, had reported success with it, this was the first time that a metropolitan library had made use of such an expedient on a large scale.

Through press and placard, the Minneapolis library let it be known that it would remit all fines on overdue books—books taken out in the regular way, on cards and charged to holders—and that return of "losts and strays"—mainly books taken without being charged—was invited, without penalty. It was particularly emphasized that in all cases "no questions asked" would apply. The words "theft" and "stolen" were not mentioned, the purpose being not to censure, not to embarrass, but to get back the public's books.

To make it easy for those who were holding books that had been filched outright, boxes and baskets were placed at the main library and at various branches. A capacious barrel outside the main library besought the passer-by to remorse and restitution. Over such receptacles in entrances and corridors placards in colors invited the remiss to deposit their withheld books and go their ways in peace and clear conscience, both their purses and their faces saved.

This lad was willing to pose at the barrel for "lost and strayed" books, but wanted it known that he was not himself a belated returner.

Results were enlightening to the library staff, not only in the recovery of volumes but in their quality and variety, and in the disclosures of the kind of folk who had held them.

More than 500 volumes were returned in the week, which meant much in a season of high prices for books and depleted library appropriations. Three in every five returns were fiction, mostly new books, with detective stories prominent. Of the non-fiction, books on chemistry and uses of the grape, bricklaying and automobiles proved their popularity by numbers. There were 15 volumes of poetry, mostly Riley, Service, and—of all men!—Browning.

A score of Hansel and Gretel had been "out" the longest—nine years. The library had made frequent efforts to replace it, but had found the work was out of print and was not to be had even in Europe. The volume was recovered in an outside box.

While most of the books came back in good condition, some showed hard usage, notably several stories for boys. About one-third of the returns were juvenile books and another one-third, books on the list of assigned readings of the Minneapolis high schools.

In those stations where, because no boxes nor baskets were provided, all returns had to be made "over the desk," books so returned had been overdue, for the most part, only a short time. The long overdue and the euphemistic "lost or strayed" were put into the dozen receptacles where anonymity could be preserved.

If one surmises that a good deal of sheepishness and desire to blush unseen characterized the returners, one is mistaken. There was a striking lack of furtiveness. More than one-third of the returns were made directly to library clerks, because they had been charged against cards and the card owners wanted clearances. Most of the uncharged books found their way into the eyeless and tongueless receptacles. No notes of explanation were met with in any of the books, but the fact that many were neatly wrapped in paper may suggest the apologetic. Despite the "no fines" announcement, an envelope containing 50 cents accompanied one of the barrel volumes.

The habit of book-lifting becomes chronic. An incident of the "week" illustrates it and explains why it was held advisable to use false bottoms of stiff paper, with center slits for books, midway in the receptacles, or paper covers with such slits, suggestive of the old-fashioned jar mouse-trap with its pie-cut top.

An assistant told the story the first day. "An empty basket had just been placed near the door. It occurred to me that it might have a good psychical effect if there were a few books in it to start off with. So, on the 'nest egg' principle, I put in three or four. Passing it a few minutes later, I looked in—and one of the books I had put in was gone. Some one had been unable to resist temptation."

Thirty-six pieces and five books of music were recovered in the week, and six religious books—all uncharged—the persons returning the latter having possibly run across an injunction reading, "Thou shalt not steal."

Debaters figured impressively in the group of long-standing hold-outers, for numerous handbooks on debating were in the round-up. Interest of the reader and declaimer, for he still persists, was evidenced by the return of many books of "selected readings."

Among books turned in were seven that bore private library stamps; they never had belonged to the public library—akin to not knowing whose umbrella had been taken. Some books were sent in, anonymously, through the mails. One mailed parcel had "from X" written in the return corner. The slip in the pocket inside the cover of the book it contained indicated that it was a charged book, and tracing disclosed that the owner of the card was a clergyman.

The week was full of the amusingly unexpected. Many women regarded it wholly from the economic side, with concern only for the saving of fines involved, and attended with the avidity usually displayed toward a cut-price sale at a department store. By such, no hesitancy was shown in taking open advantage of a novel shopping opportunity.

Not all who patronized the boxes were averse to talking about it. At the call desk in the circulation department, a man inquired for Parker's "An American Idyll."

"I've asked for it repeatedly," he commented, "but, though it is cataloged, I've never been able to find it in."

A woman at his elbow spoke up, brightly:

"Oh, there's one in now; I just dropped a copy in the box at the door."

According to Gratia Countryman, librarian of the Minneapolis library, those who took advantage of "Bargain Week" were of two classes, broadly grouped, one made up of the well-meaning but dilatory and the other of those who regard everything in the library as proper game despite rules and ethics.

"The problem of theft, or 'appropriation,' is one of concern in large libraries," Miss Countryman said. "It may astonish some folks to know that our experience here indicates that the most serious offenders—those who take away books and other material without having them charged against their cards or even with a 'by your leave,' whatever may be their purpose as to ultimate return—are professional people, especially clergymen and school teachers."

So it is not the "low-brow" who does the most "lifting"! It is "respectable" men and women, who do not regard it as stealing at all and who would take violent offense if accused of stealing.

"How to protect books from thieves is a troublesome question," Miss Countryman continued. "We have considered installing some sort of police system in the library, but without coming to favor it. In the first place, such a system would cost fully as much as the value of the books stolen. Again, any system of surveillance probably would be objectionable to the great majority of library patrons who are above suspicion.

"It has been proposed to abolish all open shelves, thus permitting books to be handled only on call to a member of the staff. Though, of course, most of our books are not directly accessible to patrons, a good many are. I believe in the open shelf."

"Bargain Week" was a success, but the Minneapolis library has no intention of making it an annual or a periodic event. Patrons might learn to wait for it, whereas novelty and unexpectedness seem to be its chief factors of promise. Probably not for four or five years will Minneapolis see another "Bargain Week."

The Garnet and Its Double

By CARL SCHURZ LOWDEN

BETWEEN the garnet and the carbuncle only the slightest difference can be observed. Scratch one and you will find the other. The garnet remains "up stage" as the January birthstone: to insure good luck, so it is said, all the sons and daughters of the first month should wear the stone. The carbuncle is a deep red garnet of large size cut in an oval or rounded form. All garnets are not carbuncles, but about 99 per cent of all carbuncles are genuine garnets.

The ancients called any fiery-red stone a carbuncle, inasmuch as it glowed like coal, which is *carbo* in Latin. Perhaps they exaggerated a bit on this score, or were too fantastic. One may read in the Talmud that old Noah had no light in the Ark except that supplied by the carbuncles he had with him during that momentous, perilous period of his life. A carbuncle might be truly considered as glowing; yet it seems that Noah either had uncommon eyesight or used a huge lot of the gems every time he perused anything.

Then there was Al Mamon, Caliph of Babylon, who discovered a fine carbuncle in an elegant sarcophagus in the pyramid of the mighty Cheops. When the adventurer raised the lid, he came near wishing he had not because the sudden light from the gem (so the legend goes) almost blinded him. To him it appeared large as an egg and to shine like the sun.

In those days of the long, long ago, jewels, particularly carbuncles, were considered appropriate offerings to the gods and goddesses. For example, the resplendent temple of the Goddess Astarte in Syria was beautifully decorated with many gems, but a large carbuncle occupied the position of greatest honor.

Even as late as the time of Mary Queen of Scots, royalty exhibited a marked preference for the stone, which may rightfully be called the garnet's double. Indeed, her favorite necklace had one of these gems serving as a magnificent pendant.

The name carbuncle (as has been said) comes from the Latin *carbo*, meaning a coal or ember. The derivation of our word, carbon, can be readily perceived; it possesses the same parentage as the gem.

Almandite, the most precious garnet of the present age, possesses a rich cherry or claret hue. It gained its name from Alabanda, an ancient town of Asia Minor, from which the stone was introduced into the social circles of Old Rome. Today it is extensively mined in Northern India, also found in Brazil, Australia and the Alps Mountains.

The diamond mines of South Africa produce a valuable form of garnet which the dealers call "Cape Ruby." Scientists know it by another term, "pyrope," meaning firelike. This dark, blood-red gem commands a high price, even occasionally exceeding that of the precious almandite.

Fine pyropes picked up in Arizona and adjacent states are imitatively designated "Arizona Rubies." They are usually discovered in the galleries of the homes of ants and centipedes, the insects thus serving mankind as unwitting miners. In artificial light these stones outshine their African brethren.

Only two of our states, North Carolina and Pennsylvania, produce both the almandite and pyrope kinds of garnet. However, one variety or the other can be found in Colorado, Georgia, New Hampshire, New Mexico, Virginia and Utah.

The hardness of the garnet ranges from 6.5 to 7.5, depending on its composition. It will almost invariably scratch glass, and is often of sufficient hardness to be used as watch jewels.

Tons of the ordinary or plebeian garnet of pinhead size and much too small to be accounted gems, are obtained from mines in New York. It provides excellent abrasive material for the manufacture of shoes, and in its ground form lapidaries employ it to cut and polish other stones. Thus the garnet embraces the two extremes, the high and the low, the beautiful and the useful. One is set in the same ornament that contains diamonds, but the other is nothing more than a good grade of sandpaper.

But no January child should be ashamed of his birthstone; for it is entirely worthy, all the more worthy because practical in its lower types. It is said the wearer receives power, truth, grace and constancy, and no one can deny the value of these qualities. Scoffers say it cannot and does not influence its owner in any way. They may be right, but it is much more pleasant to accept, however lightly, the beliefs of the ancients. Besides no playful, sportive person really wants to be a doubter or a prosaic clod, as it is but a short step from the doubter to the sour-visaged cynic; rather would he think

> "The gleaming garnet holds within its sway
> Faith, constancy, and truth to one alway."

The garnet has made one definite advancement. It has just about entirely discarded the name of carbuncle. The Old Romans liked it, but we Americans don't. It has come up, as it were, from slavery. That is merely an added reason why January children should adore it and should be ready to act on the suggestion that

> "No gems save garnets should be worn
> By her who in this month was born;
> They will insure her constancy,
> True friendship and fidelity."

When the State Becomes Its Own Miller

By EARL CHRISTMAS

SAY anything about wheat grades to the average farmer who raises wheat, and you are likely to start an argument. Or possibly a fight, depending on what your views are and how strongly you insist on them. Certainly, if the farmer be a grower of spring wheat, the session will be warm. For the farmer, wheat grades constitute a sore spot. The subject has been considered and debated by government officials and commissions. Grades have been set, and rules and regulations promulgated by numerous boards.

But despite all the rules, the feeling has been rather widespread among the farmers, particularly in the Northwest, that the Federal system of wheat grades is unfair. The farmer is convinced that his wheat has a higher milling value than the mechanical grading indicates. If wheat were graded in accordance with its actual milling value, he would get more money for his wheat. At least, that's the way it looks to the farmer.

Numerous complaints have been made over the application of the Federal grades. Certainly to the farmer who happens to have wheat of low grade, has the system seemed wrong. You never in the world could convince him that some one is not making a handsome profit off his technical misfortune. Often, it has seemed to this farmer, the grades were set more to protect the miller and the trader than the wheat grower.

So, there may be something of significance in a new project that is just getting under way in Minnesota. Like farmers in other sections of the country, Minnesota farmers have had an unshaken conviction in the milling value of their wheat—more faith sometimes than the millers have indicated. Their wheat might not grade very high, but they were sure always it would make good flour. In short, they proposed to find out just what the milling value of their wheat was. Nor would they leave it to a laboratory. They proposed to have an actual flour mill, owned and operated by the state. As a result, there has just been established in Minneapolis an experimental mill, said to be the largest of its kind in the world.

In other words, the state has turned miller. The state is going to see just what the milling value of its wheat is, by running a mill just as the commercial millers do, a unique enterprise even in these days of innovations. Nor is that all. The state, having turned miller, proposes to conduct its job on a business basis. Flour ground in the state mill will be used to supply the 18 state institutions with bread. These institutions now use about 12,000 barrels of flour yearly. The new mill, with a capacity of 100 barrels of flour a day, will be able to supply all the flour needed by these institutions and considerably more when running at full capacity.

That means that the state of Minnesota soon will be grinding its own flour. The mill stands ready to begin operation. In a few weeks wards of the state, scattered through its varied institutions, will be eating bread made from flour ground in the state-owned mill.

But providing flour for the state institutions isn't to be the biggest accomplishment of the Minnesota mill.

"The mill was established to test the flour-making properties of Minnesota wheat," N. J. Holmberg, state commissioner of agriculture, explained.

The new flour mill, by the way, is in charge of the State Department of Agriculture, and consequently in the hands of men who are alive to the interests of the farmers.

"For a long time there has been complaint against the official grades," Mr. Holmberg said. "The farmers have contended that the grades, especially the Federal grades, do not properly represent the value of wheat for milling purposes.

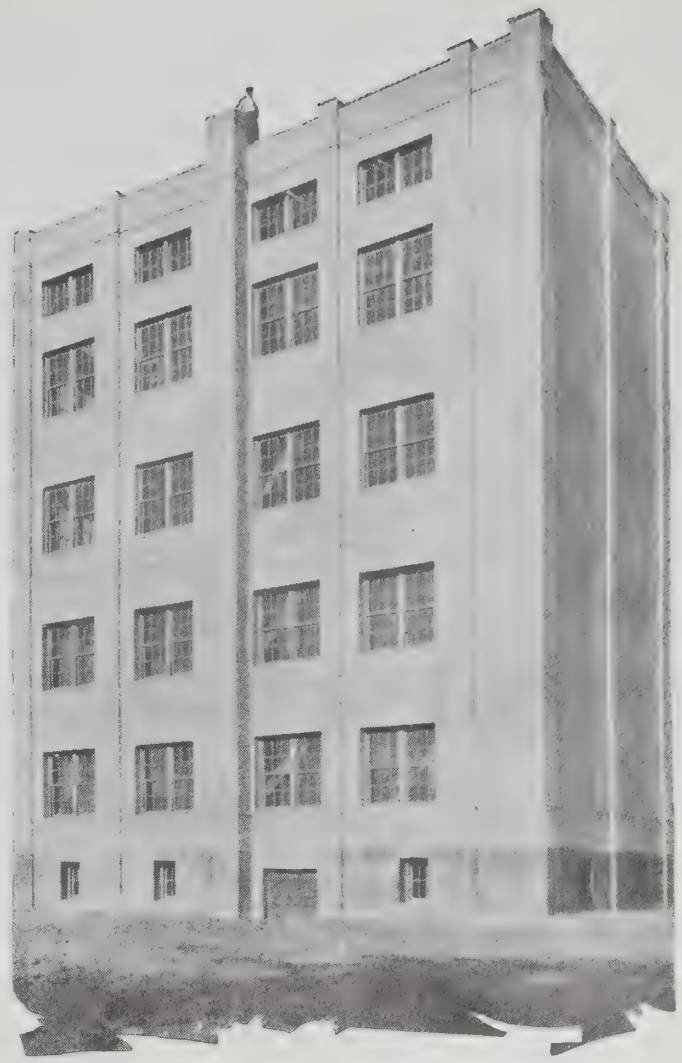
"Of course, there were grain appeal boards and plenty of regulations by different authorities. But in the end the whole question reverted to the necessity of determining the milling value of the wheat. And to find out the milling value of his wheat, the farmer did not have an unbiased source of information. He was entirely at the mercy of the miller.

"So, the farmers decided to establish their own mill, and see for themselves just how good their wheat is when it comes to making flour. The legislature gladly acceded to the wishes of the farmers, and we now have here in Minnesota the most complete experimental mill in the world. The mill has every feature of the big mills in Minneapolis. Though built on a smaller scale, the state mill will use the same processes.

"Nothing has been spared to make the mill complete. Erected at a cost of $85,000, the mill has been placed in charge of a man who has had long experience with one of the biggest milling companies in Minneapolis. He is to be business manager of the mill, and will be responsible to the Department of Agriculture. The mill must be made self-supporting. The laboratory and scientific work at the mill has been placed in charge of Professor C. H. Bailey, an expert in cereals from the University of Minnesota.

"To begin with, we plan to get samples of wheat from different sections of the state. We propose to get all the different varieties. Then we will run them through the mill, and determine definitely their value in making flour. Also, we propose to determine the cost, so far as we may, of making flour from the different varieties.

"After this mill gets under way, any farmer or holder of grain who is not satisfied that his wheat has received a fair grade may send in a bushel or two of grain and ask for a flour test. This will cost him nothing, and the result will show just how good is his wheat.



"The information obtained will be of tremendous value. Not only will it show the farmer the milling value of his wheat, but undoubtedly will help him to get a better price for his wheat if the tests justify it. The information obtained will be of great help in determining suitable grain grades. Federal grades are largely physical, and very little attention has been paid to flour-making properties of the wheat in their establishment. Of course, the millers, and many grain men, I suppose, will contend that flour-making properties of wheat can be determined fairly accurately by the purely physical standards of the Federal rules, but Minnesota farmers do not agree. Though wheat may be shriveled, or have an unfavorable appearance in other ways, it may make good flour. At least, that is the contention of the farmer.

"The mill will serve another important purpose. Information of the tests is to be published periodically, thus suggesting to farmers in different sections of the state what varieties of wheat pay best to raise."

The farmer's bill of particulars against the present system of handling his grain leads far and includes a good many counts, many of his objections being directed at practices and applications of the rules.

The new state flour mill in Minnesota, however, is fundamental in its purpose. The function of grades is to measure the milling value of wheat, according to the Minnesota farmer. That is the only excuse wheat grades have for existence, says the farmer. So, the state of Minnesota is going to find out for the farmer just what is the milling value of his wheat. Having established itself in these fundamentals, the state can proceed more effectively to check objectionable practices and administer more wisely rules designed to improve the great market at Minneapolis.

Flour manufactured at the mill is to be sold to state institutions at cost. The surplus may be sold in the market. Bran and shorts and other products of the average commercial mill will be sold for use on state institution farms. These returns will make the mill self-supporting, according to Mr. Holmberg. Indeed, the state of Minnesota has turned miller in earnest.

The State of Minnesota has turned miller. Here is the new state flour mill just completed in Minneapolis.

A Freight Train in China

China's freight trains may be described as made up of "cars, each possessing a head, a pair of humps, a tail and four legs." When a Chinese says "train" he invariably means "camel caravan" or "camel train," of which a section is here shown passing through one of the gates of Pekin. The whole nation has only a few thousand miles of railway, an average of one mile for each 50,000 of population. Contrast this with our ratio of a mile for each group of 360 persons.

The Prince of Wales, accompanied by Lord Reading, proceeding from the landing place to the amphitheater at Bombay.

The Indian Ferment and the Prince of Wales' Visit

By W. P. CROZIER

SINCE this article was written events in India have been moving rapidly. The All-India Congress has met and renewed expressions of confidence in the leadership of Mahatma Gandhi, and he has succeeded, against strong opposition, in holding the nationalist movement to the policy of peaceful non-resistance. This, despite the fact that the course of the Reading administration during the occasion of the prince's visit was well calculated to incite the masses to violence. The annual meeting of the Indian National Congress was banned for the first time in 40 years and various native leaders alone capable of holding the passions of the people in check were imprisoned. In India as in Egypt, Persia, Palestine and elsewhere in the East the influence of the Jewish vicegerency seems to have intensified native discontent.

THE Prince of Wales, they say, is fighting a duel in India. It is a duel in which he has many opponents. They are the leaders of the two branches of the agitation against British rule. On the one hand is the campaign of the Moslems, led by the Ali brothers (who have just been sentenced to a term of imprisonment); on the other is the Non-Co-operation movement led by Mr. Gandhi. Mr. Gandhi is the more formidable influence; his campaign is just reaching its moment of crisis and the visit of the prince will in some measure decide whether the masses of India mean to stand by the British power in India or to take sides against it under Mr. Gandhi's leadership.

There are many persons in England who thought it was ill-advised to send the prince to India. They held that the sources of political discontent are so deeply rooted that the effect of a visit from the young prince, who has won great affection in his own country by his modest and ingenuous bearing, could not be more than transitory. India is certainly accustomed by the experience of long centuries to the idea of absolute rule. At least a third of India even today is ruled by native princes whose power is only limited by the advice of the political officers whom the Government of India maintains at their courts. It was reasonable to suppose that the loyalty of such native states would be confirmed and the affection of some part of the city populations strengthened by the personal presence of the Prince of Wales.

But beyond that, all was speculation. Only a very small part of the 300,000,000 in India could ever see him, but it was argued that the rest would hear of him and that for many imagination would be as potent as the actual vision. The Government of India decided, therefore, to recommend the visit of the prince as a high piece of statecraft, and at the same time it made up its mind to strike at the leaders of the political revolt who had brought themselves within the range of the law.

This revolt has two wings, the Moslem and the Hindu. It is the sign and proof of the peril in India that for the first time in history Moslem and Hindu have united against British rule. Hitherto they have been at daggers drawn. It has always been one of the main tasks of the British to keep the peace between them and it is one of the moral certainties of history that if the British were swept out of India tomorrow, as Mr. Gandhi would have them swept, Moslem and Hindu would be cutting each other's throats from one end of India to the other the next morning.

But at present the political leaders of the two sections are united in a common aim and that is a very serious fact for the British Government. It is no longer possible to count on the hostility of the Moslem to the line of conduct, whatever it may be, that the Hindu has chosen. In actual practice, as will appear shortly, the masses of the population maintain the traditional hostility, and when the Moslem takes to open rebellion, he turns at once to the lucrative and (as it seems to him) most natural course of pillaging his Hindu neighbors.

The Moslem agitation is based on religious fanaticism. The charge against the British Government is that it has attacked and endangered the Sultan of Turkey in his religious capacity as the Khalif of Islam —hence the so-called "Khalifate" agitation—and that it has dismembered his dominion. It is not uncharitable to suggest that with most of the leaders of the agitation this is but another stick, and a good one, wherewith to beat the British Government. The Ali brothers have always been bitter critics of British rule. On the other hand, tens of thousands of good Moslems in Mesopotamia and elsewhere actually fought against the Khalif and not a word was heard from them of discontent on that ground. But religious passion is very fruitful soil when worked industriously, and the crop which has been sown since 1918 has come up vigorously. The Moplah revolt is sufficient proof of that.

The Moplahs are a race on the Malabar coast in Southern India, partly indigenous, partly of the blood of Arab traders. They are Moslems, with many Hindus living among them. Their fanatical violence is famous even in India. They have the pleasant habit, when they break into revolt, of fighting to the death, and in recent history there are instances of gangs of Moplah outlaws, who had taken refuge in temples, having to be destroyed by howitzer fire and by dynamite. They hate the Hindu landlords and wreak their fury on them whatever the immediate occasion for their rising. The present rebellion from the beginning had a political aspect. Moslem speakers had in 1921 spread the cry of the Khalifate in danger far and wide in Malabar. When the rebels took the field it was not the national flag prescribed by Mr. Gandhi that they flew, but the green flag of the Khalif with crescent and five stars, and bearing this inscription:

> "Khalifate and Allah the Great!
>
> "Old and weak, young and strong, those who walk, those who ride, rich and poor, armed and unarmed, well and infirm, let everyone, counting this life as nought, in Godlike guise set forth to battle!"

From the Moplah rising one may judge how the Moslem politicians have succeeded in inflaming large masses of the people, and also how little it counts that some of them (not all) declare they are opposed to violence. They preach non-violence, but not one of them can guarantee it, so inflammable and prone to violence by nature and tradition is the population to whom they preach. The violence of the Moplahs, however, took one form that was very unpalatable both to the Moslem and the Hindu leaders. Moslems and Hindus are not only supposed to be working together now for the overthrow of British rule, but the assumption of their campaign is that when the British have disappeared, the two sections will work together in complete amity. But in Malabar the Moslems burned and looted Hindu houses, broke into and pillaged Hindu temples, and forcibly converted Hindus into Moslems. Islam was always a crusading religion from the time of Mohammed and the Moplahs only acted as Mohammed would have had them act. However, it was awkward for Mr. Gandhi and an object lesson which, it is said, has not been lost on large numbers of peaceable and defenseless Hindus. British rule, said the Hindu merchant, is no doubt bad, but better British rule than no rule at all, which means a Moslem onslaught.

Not all the Moslem leaders can be acquitted of the charge of advocating or condoning violence, which in India might quickly come to an upheaval terrible beyond words. Mohammed Ali, indeed, during his trial at Karachi, declared that he and Gandhi had "given their word of non-violence to God and man." But his brother, Shaukat Ali, at the same time said that if non-violent means fail violence would be permissible, and Dr. Kitchlew, another prisoner, also expressed himself as ready for violent revolution. When the leaders use such words, it would be idle to blame the untutored rank and file if they chose their own moment to translate words into action. Add that the Khalifate spokesmen had announced that it was unlawful for a Moslem to enter or to remain in the British Army, and it will be seen how dangerous to the British position in India is the Moslem side of the joint agitation.

Mr. Gandhi is even more dangerous, although in a subtler manner. He is an ascetic, a holy man, ready to offer himself as a sacrifice for his ideals, and the Indian mind has always a deep reverence for the devotee. Mr. Gandhi, who demands full Swaraj, or Home Rule, is the author of the doctrine of Non-Co-operation, by which is meant that the native peoples of India are to withdraw themselves from all contact with the British administration. Students, barristers, judges, civil servants of all kinds are expected to lay down their work under the Indian Government, and Mr. Gandhi has also adopted the declaration of Mohammed Ali that Indians ought not to join, or remain in, the Indian Army. When a short time ago, it became

(C) Underwood & Underwood

The Prince of Wales presenting colors to the 17th Rajputs, on his visit to Bombay. Disturbances occurred during his visit to that city.

clear that Mr. Gandhi's campaign would not bring Swaraj by the end of 1921, he advanced a further stage and announced that he would institute "civil resistance."

By this he meant passive resistance of all kinds to the government, including refusal to pay taxes. "One perfect civil resister," he said the other day, "is enough to win the battle of right against wrong." Mr. Gandhi is firmly and sincerely against violence of all kinds. When his teaching was followed in the spring of 1919, by a violent outbreak on the part of his followers, he expressed the strongest condemnation and did penance publicly. And lately, when his followers terrorized Bombay, on the landing of the Prince of Wales, and even took the lives of peaceable citizens, he shut himself up in mourning and declared that the opening of "civil resistance" must be postponed since his followers were unable to carry out the pure spirit of the principle of passive non-violent resistance. Certainly they have shown that they cannot. Mr. Gandhi is an idealist and a holy man, but the Indian mobs interpret his idealism in terms of revolutionary violence.

Mr. Gandhi's philosophy, however, does not merely aim at political Home Rule. He would like to do away with every trace of British (and Western) civilization. He demands that every Indian should cease to buy foreign cloth and all should supply their own needs by the ancient Indian hand loom. He would not even have mills in India. It is his followers who organize the bonfires of good Lancashire cloth. He hates the word "machinery" and the thing itself; his native critics gibe at him for using (as he always does) the motor car. Machinery, he says, is the chief symbol of modern civilization; it represents a great sin." He would have Indians retain "the same kind of plow as existed thousands of years ago." He would have them refuse the mechanical lamp and substitute the earthenware saucer of oil with a wick floating in it. He condemns the railways, tramcars, electric lights and all the furniture of modern civilization. He would put India back into the Dark Ages, which are for him the Golden Age.

To British eyes he is impracticable, impossible. Time, the British are sure, cannot so be put back; the world, even the old world of India, will and must march on. But his passion and sincerity make him a force. He is insistent on the need for Hindu-Moslem unity and on the moral power—the old Eastern idea—of those who are prepared to suffer, even to die, for an ideal. Punishments have no terror for him; rather, he hopes and longs for them. "You threaten," he says to the government, "to arrest, imprison or even hang us. Why, these are the things for which we crave, for through our sufferings we shall achieve first the moral and then the material victory." That is why his student-followers are going out to court arrest. That is why the government has not arrested Gandhi himself, much to his disappointment.

But with the visit of the Prince of Wales things have come to a crisis. The Gandhi-Moslem followers have formed volunteers all over India wearing a sort of uniform. They are organizing *hartals*, or days of mourning, and boycotts of the prince's visit. At Allahabad the boycott was highly successful. At Bombay the volunteers terrorized a large part of the town and, when great crowds went out to see the prince, they fell on innocent individuals and beat and even slew them.

In Calcutta they organized a *hartal* that made the place for a day almost a city of the dead, and they have been busy for some time preparing to carry out a great boycott of the prince. Such associations of volunteers are already illegal, even if they were non-violent and innocent of terrorism. But when, as at Bombay, the peaceable inhabitants were intimidated and beaten by the volunteers, the government had to take action or it would have proved to all India that Mr. Gandhi was the master and all India would have been quick to act on the lesson.

So the Indian Government has acted, but it is in a sore dilemma. It has made many hundreds of arrests. It has laid hands on all the leaders of the Hindu-Moslem movement, including many men of high reputation and character and of the greatest influence in their provinces. Its sweeping policy of repression has already brought forth protests from moderate and loyal Indians who are members of the Indian Government. It is to be feared that one result of these wholesale arrests may be to increase the power of those leaders who are more prone to violence and who have less scruple in inciting the mobs to revolutionary methods.

Here is a people of 300,000,000. Only a small proportion of them are educated, politically-minded, fit for self-government in the same sense as the average American or British citizen. The masses are not only ignorant and fanatical but definitely illiterate. Yet it is among these highly inflammable masses that the Swaraj movement has made great and rapid headway and among them that it threatens to erupt violently. The Moplah rebellion and the Bombay riots are only slight symptoms of what may be. What, then, could a government do? One thing is certain. Repression, though it may be unavoidable, will not by itself solve this problem. India is moving too rapidly for that. The Indian Government, which has just given so large a measure of reform, will have to consider what further it can do to appease the present discontents. Ireland and India are very different places, but the freeing of Ireland will leave a deep mark on India's history.

Mathematics

By FREDERICK R. BURCH

ELLIOT in his work on usury, page 182, says, "One cent loaned January 1, A. D. 1, drawing interest at the rate of six per cent compounded annually, on January 1, 1895, would amount to $8,497,840,000,000,000,000,000,000,000,000,000,000,000 (8,497,840,000 decillions of dollars). To pay this in gold, 23.2 grains to the dollar, using it in spheres of pure gold the size of the earth, it would take 610,070,000,000,000,000 spheres of gold to pay the debt."

If Methuselah at 21 years of age had loaned $1 at six per cent compounded yearly, at the time of his death 948 years later, that single dollar would have grown to more than $977,000,000,000,000,000,000,000 (997 sextillions of dollars).—Figures by McCoy, government actuary.

Debts of the government, of states, cities, counties, school districts, port districts, improvement districts, transportation corporations, all industrial corporations, private mortgages and bank loans, amount to more than $150,000,000,000, approximately $1,500 for every man, woman and child in the United States.—Figures by Richardson.

Practically all this debt has been accumulated in the last 50 years. Each individual is paying interest on this sum to the extent of his consumption of wealth

This sum at five per cent, compounded yearly, will double in 14.2 years. In other words, the people in 14.2 years will have paid cash, as interest, equal to the debt and still owe the debt. This money thus paid as interest will be reloaned, thereby increasing the debt to 300 billions of dollars. In the succeeding 14.2 years at five per cent compounded yearly, this debt will become 600 billions of dollars.

The entire wealth of the United States is approximately 400 billions of dollars.

A farm mortgaged for more than it is worth is of no value to the owner.

A nation hopelessly insolvent is of no value to its citizens.

All those who so smugly and complacently drift along from day to day, convinced of the divine rights of interest-bearing debts, may well do some computing.

This appalling condition is to be consummated by a few eminent financiers through the use of government equipment (public property), for private gain. The entire program is to be "put across" under the pretense that money is a commodity; the while each citizen, with a superficial understanding hampered with convictions, is to accept this fallacy as a fact.

No one can deny the astounding accrescent power of money via the interest route. No one can deny the controlling power of money thus amassed. No one can deny that this power now lodges in the banking system. No one can deny that the bankers are human beings engaged in business for gain and no one can deny that they will, and do, use this power for all there is in it.

Thus far there is apparently no argument. It is not till the question of the *right* of the banking system, as now constituted, to perform the above functions is approached that dissension appears. The great majority concedes this right.

They commence their arguments by basing all deductions on the hypothesis that money is a commodity, a thing to be privately owned, and traded and bartered at will, like any other commodity. With this point fixed in their minds, they have no trouble in applying the laws of economics and emerge from the controversy fully satisfied with their conclusions. The only relief which they visualize is that, by a show of righteous indignation in times of stress, the system will be moved to compassion.

Another Newspaper Man in the Lords

THE recent conferring of a peerage on Sir Henry Dalziel, owner of the London *Daily Chronicle*, the *Pall Mall Gazette* and *Reynolds' Newspaper*, among other journalistic properties, is a reminder that Britain not less than the United States, is a land of opportunity. We think of the rise of a man from poverty and obscurity to the highest eminence as a possibility peculiar to new countries with immense natural resources.

The rise of Lord Dalziel is one of many instances that go to show that in even an old and "worn-out" country of small area and natural resources, democratic institutions open the way for any man of genuine character and ability to carve out a successful career for himself.

Thirty years ago or so, the new newspaper peer was a free-lance journalist in London's famous Fleet street. He made a specialty of reporting radical political meetings in South London and Irish meetings. That is to say, the assignments he picked were those which the average reporter disdained to tackle seriously and understandingly. In the '90's he became London correspondent for the *Scottish Leader*, a Gladstonian organ which had a short life. The canny Scot, however, utilized his opportunity to get into Parliament. Hearing that the Liberal party managers were in difficulties over the conflicting claims of different aspirants to the vacant Kircaldy seat, he went boldly to the Liberal whips, told them he hailed from the borough and that if they would pay his expenses he would obtain the representation of the constituency for them. He won the seat and thereafter distinguished himself in the House of Commons as a Radical stormy petrel.

He remained a Radical, indeed, until the split between Premier Asquith and Lloyd George, in 1916, when he attached himself to the present Prime Minister and became one of his strongest supporters. It was in Lloyd George's interest, in fact, that Dalziel bought the *Daily Chronicle* and the *Pall Mall Gazette* so as to offset the powerful opposition of the *Daily News*, the leading Liberal organ, which continued faithful to Asquith.

Dalziel's fortune was made through a gift which he developed for newspaper brokerage. He got hold of a tottering Sunday paper, the *Weekly Dispatch*, built it up and sold it to Lord Northcliffe at a handsome profit. Later he acquired *Reynolds*, for long a revolutionary republican organ, which he still directs. But its policy has been modified to meet his later views.

BRIEFLY TOLD

A Nebraska man has been married by wire to a girl in Paris. The judge who married them went with the groom to the telegraph office, where the court asked the groom the usual questions, receiving affirmative answers. The judge then sent a cablegram to the bride in Paris, in which he asked the questions of the marriage ceremony. Seven hours later the answering cable was received, and the court declared the two man and wife and sent the bride a cable to that effect.

A new method of blasting coal by water instead of powder will diminish greatly the frequency of mining disasters, it is believed. The apparatus consists of a long nozzle that fits exactly into the hole bored by the miners for the powder charge. A few quarts of water injected into the hole drives out the gas in the coal and another charge of water cracks and breaks the coal, making it soft enough to bring down with a pick. It is said the new method is a success in England and certain parts of America.

An old apple tree, the oldest on the Pacific Coast, is located in Vancouver, Washington. When but a seedling it was brought to the mouth of the Columbia River by employes of the old Hudson's Bay Company, 100 years ago next March. This patriarchal tree is still bearing delicious fruit.

Brigadier General the Honorable C. G. Bruce will lead the new expedition to the summit of Mount Everest early this year, according to reports. The present expedition has now accomplished its purpose and ascertained that the climb is possible of achievement. The Royal Geographical Society must now find six men, in addition to the chief, who can stand the blizzards and cold which they will encounter during the later stages of the trip.

Wireless telephonic news service is to be distributed from the Eiffel Tower in Paris, according to the chief of the French Military Wireless Service. The news will consist of important political and financial events in France and throughout the world, the government wireless picking up the foreign news. Banks and newspapers with receiving stations are to receive this official news service free. London-Paris wireless service will probably be installed soon, so that any subscriber in Paris can talk with a person in London by way of the Eiffel Tower.

The death penalty is provided for any attempt against the government of Poland. Prison terms of 20 years are imposed on individuals involved in preparation of such attempts and the law provides that the sentences automatically follow on the court's decision as to guilt.

"Jewish Influence on American Life," Volume III in the series on "The International Jew," comprises a third selection of articles on the Jewish Question, and is now off the press. It contains 256 pages, and will be sent for the cost of printing and mailing, which is 25 cents.

"The International Jew," Volume I, and "Jewish Activities in the United States," Volume II, 235 and 256 pages, sent for 25 cents each.

Two ships, the Minneapolis and the Marblehead, which helped to make naval history for America during the Spanish-American War, were recently sold for junk in Oakland, California, and are now being dismantled at a shipyard there. During that war the Marblehead, in company with another cruiser, entered the harbor of Cienfuegos, Cuba, and cut a cable while under fire of the Spanish guns.

An Arctic adventurer recently sailed into Nome from the frozen north and, not knowing that the war was over, tried to enlist in the American Army to fight in France. He had been three years getting to Nome from the Coronation Gulf country. He left the gulf in October, 1918, on hearing that the United States had entered the war. The small schooner on which he journeyed was wrecked in the ice and he was forced to walk 27 days before discovering an Eskimo village. He lived on roots and small game during that time.

A community corncrib, large enough to hold all the corn that can be offered, will be erected in Neligh, Nebraska, if the plans of business men of that city carry. This crib will be made available for the use of any corn grower who desires to use it, and the grower will be paid in cash the market price of his product on the day of delivery.

The King of Denmark, it is said, unknowingly gave aid to an escaped convict on his recent visit to Greenland. A solitary Eskimo, in his little native canoe, was picked up by the royal yacht far out on the open sea. The Eskimo came on board and the king, believing him to be a loyal citizen who braved the perils of the sea to meet him, treated him to a warm welcome and presented him with a modern rifle and ammunition. Later, when describing the incident to the Danish commissioner in Greenland, the king was surprised to find that the man was a convict who had broken prison and escaped to the mainland in a canoe.

An airplane, flying low over woods and swamps of Florida, is used by a deputy sheriff of that state to locate illicit stills. When moonshine operators are spotted, the sheriff returns to the city and prepares to raid the stills. In one day he has found three stills, destroyed 1,000 gallons of mash and arrested three men.

The sea otter, once almost extinct, is again inhabiting the sea-kelp beds on the Aleutian Islands. These animals, driven from the Aleutians a generation ago, took refuge on uncharted reefs south of the Commander group and increased, and are now making their way back to the old grounds on the West Alaskan Coast, where there is abundant food and shelter. Like the fur seal, the pelt shimmers like ebony, showing silver when blown open. They measure six feet in length, have a beaver-like face, cat's teeth and webbed feet.

The high prices asked for coal by American operators and dealers, together with the high freight rates, has resulted in British soft coal being bought in large quantities for general consumption in New York and Boston and the West Indies. The markets of the West Indies have been in the hands of American exporters for 40 years.

The "peace dollar" is the name of the new silver dollar now being coined in the Philadelphia mint. On the back of the new coin is the figure of an eagle, standing on a mountain top. An olive branch, which is symbolic of the Washington conference, lies near the eagle. Back of the mountain shines the rays of the sun of a new era. A new head of the Goddess of Liberty, with the words "Liberty" and "In God We Trust" is found on the front of the coin.

The Massachusetts Forestry Association offers as a premium, to plant 5,000 tree seedlings, approximately five acres, free of charge for any town or city in Massachusetts which will legally establish a town forest of 100 acres or more in area during the calendar year 1922. Fitchburg, Massachusetts, holds the unchallenged distinction, so far as the association knows, of having established the first town forest in the United States. Town forests in Europe prove very profitable, the inhabitants of such towns in many cases are handed checks instead of tax bills.

A steeplejack in Chicago was marooned atop a 150-foot chimney in a cold wind for three hours recently. While putting the finishing touches on the chimney the hoisting rope broke and left him without any means to descend. Life guns finally shot him a hoisting rope which he grasped. He was almost frozen when he descended.

Fighting the Powerful and Crafty Opium Ring

Syndicate That Handles Drug Has Its Tentacles in All Parts of the World; Ingenuity of Smugglers Handicaps Government in Attempts to Curb Traffic

WITH the eyes of the world turned on affairs of the Far East and with the conscience of civilized peoples awakening to conditions of the eastern Pacific countries, it would be fitting to give a little attention to the most secret corporation or business in the world that has its source of supply in that part of the globe. It is a powerful and far-reaching business.

A great and strict scrutiny of enlightened public opinion might be the means of at least curtailing its sinister influence and ramifications.

"The Opium Ring" is what it is called. Its real name is not known. As far as is known, it has no permanent office or headquarters, but in border cities there are its nuclei, and its agents and operators are found everywhere. It is not listed in Bradstreet, nor are its bonds subject to stock fluctuations, yet its earnings are enormous, and its agents are made independent for life by a simple deal in its only commodity—opium.

The opium ring is in business to make money. It will make money at the expense of the souls and bodies of mankind whether they are Americans, Chinese, East Indians, Englishmen or Frenchmen. The opium ring operates wholly without the law. Several thousand per cent is nothing unusual for it to charge its victims.

The nations that are invited to the conference now in session for the Limitation of Armaments have through their customs departments and secret agents recognized the ring as a syndicate of huge capital. Opium, as almost everyone knows, is made from the inspissated juice of the poppy. It is in demand everywhere by thousands of victims of its narcotic effects. The laws of all civilized nations prohibit its import except under heavy customs duties. Even then it must be specified that it is only for lawful medicinal uses, and a record must be kept each time it changes hands, the laws say.

Agents of the Treasury Department, of the Bureau of Internal Revenue, police and customs officers are all watching for those who carry the drug and who are in the employ of the ring. Yet with all their vigilance and watchfulness, and in spite of all laws the ring succeeds in bringing dope into the country in large quantities.

In all the years of its existence the ring has succeeded in keeping the identity of its members a secret, except as some who are trafficking in the drug may be caught. Even then these who carry the drug know so little of the other members that they cannot, if they wish, give much valuable information. Because of this, even the shrewdest detectives are at a disadvantage. Its employes are cosmopolitan—from every race and walk of life.

The ring arranges that its emissaries shall never meet, except under extraordinary circumstances. A carrying agent may be in its service for years, but after the first negotiations, there is no intimation for whom he may be working. He may land any number of tins of opium, faithfully labor for the ring, but without the slightest knowledge whence it came or who received it.

Profits of the ring are enormous. A tin of opium in China is worth from $5 to $10; in Manila, San Francisco or New York it increases to $75, $100, and even $150 wholesale! The traveling agent's remuneration is on the commission basis.

One of the agents who was in the business for a time told his experiences.

When traveling by boat he had nothing to do with getting the "dope" on board. It would "happen" to be there and in a place where he could find it. If discovered by another, he would disclaim all knowledge of it. His business was only to land the drug. Once in Manila, he would bury it in the sand, leaving no more marks than possible. If the customs and secret service launches that patrol the bay were too ubiquitous, then it would probably be dropped over the stern of the ship in a net attached to a small bunk floating just below the surface of the water. If thrown overboard, certain flashlight signals would be made toward a certain point at a certain hour.

Some of the methods used by the ring for concealment were unique. The following scheme was used at one time: The agent up to the last bell for leaving China discovered no opium aboard. During the last scurry of passengers and visitors before the ship lifted anchor, the agent beheld a portly Chinese with a serious expression walking down the gangplank. He looked at no one, but continued walking, eyes fixed firmly ahead, as if contemplating the great ideals of Confucius. He was the local laundry boss.

The agent on entering his cabin after the boat had left found his laundry portmanteau lying open, the white shirts all spotless. On the floor was another suitcase exactly like the first, even to its half obliterated labels, but underneath the garments there were 100 tins of opium!

During the voyage all was well. Only a little caution on the part of the agent was necessary. On reaching Manila, which is a very profitable market for the ring, and much less hazardous than the continental cities of Asia and America, the agent concealed the extra portmanteau, with a fictitious name attached, in the luggage on deck. The ships are not searched in passing through a port, but all passengers are and so is everything that goes ashore. After dark the opium was hung over the side of the ship in a net. Toward morning the net was empty and the opium gone!

The "dope" on this table is worth more than $70,000. This was the haul of the Philadelphia police in a recent raid. The drugs are shown in their original packages. Raids in different parts of the country hardly keep pace with the consumption of opium and other narcotics in America.

The agent did not see the recipients nor did they see him, but as the steamer left, the agent found proof that the right authorities had received it, by looking into his laundry. The inside of his linen was lined with greenbacks!

The fact that the Chinese are the greatest users of the drug makes it easier for the ring to corrupt them for smuggling. Consequently, it is to China that some of the best agents of the Federal Government are sent to keep in touch with the sources of supply and to know who are engaged in the business.

One of these government detectives related his experiences:

"We always look for it where one would least expect to find it," he said. "Even then, it is usually only the place it recently occupied that we discover—the dope has disappeared.

"These steamers of the Far East are so full of nooks and crannies and chinks and corners that even though we go over them with a fine-tooth comb, we are almost certain to arrive just too late."

"What portion of smuggled opium gets through?" the writer asked.

"Much depends on the direction in which it it is going," he said. "The 'movement' is a very complicated one. It is against Chinese laws even to grow the poppy within the borders of the republic. But it still goes on to a certain extent.

"All up through Kwangsi and Yunnan scarcely a white man ever goes, and these districts are particularly anti-foreign. It is such sections where the poppy is still grown, and from them not a little of the crude opium—in jars for the most part, but also in bamboo, in caddies of tea, and in a hundred different ways—comes down to Hong Kong and Shanghai as the distributing center for the Far East. And most all of it gets through.

"It is true that the government has no particular interest in the opium only as it leaves China for America, Europe and the Philippines. It is to watch for that opium that is taken past the customs that we are sent to the Far East. Any information that we gain of opium being surreptitiously taken out of the country, we place at the disposal of the proper authorities."

"You send word on ahead?" he was asked.

"Many of the largest hauls in San Francisco and Manila are oftentimes due to information given by us," he replied.

"How do you tell the regular opium from the contraband?" interrogated the writer.

"Principally because all opium which comes or goes from China is supposed to be handled by the opium 'farm,' and the stuff that has been handled in the 'farm' refinery is easily distinguished from that which has been treated elsewhere. There also is a decided difference between the Indian and the Chinese grade. By knowing all this, we are able to trace more accurately and quickly."

The writer told him he was a novice and didn't know what the opium "farm" was. He explained:

"The 'farm' is nothing more than the privilege of handling all the opium which is brought to Hong Kong from India. Before the anti-opium movement in China, and the closing of the dens, this brought in more than $2,000,000 a year. Now its value has been cut down.

"You asked about the amount of opium that was successfully smuggled, and I have given you the lay of things to show you what a mixed-up mess it is and what a really difficult question it is to answer.

"Roughly speaking, however, I should say that not 10 per cent of the opium smuggled out of China is intercepted.

"In taking opium to America, the risk of detection is increased, of course, but I put the amount at 10 per cent because if much over that amount was seized the ring could not and would not take many chances."

Those who are familiar with the work of the customs officers of San Francisco know something of the hard and trying work of these men at least to hold down the traffic of the ring to minimum proportions.

They have fished cans and tins of opium out of the bay that were found floating and fastened to a fisherman's buoy; it has been found under the mattress of an unsuspecting sea captain; it has been concealed in the newel posts of the companionway, in eggs, in bolts of silk, and in sacks of flour.

But the ring is attempting other methods of getting the drug into the United States than by seaport towns. United States revenue officers have found that a considerable amount has recently been smuggled over the Mexican border.

The tricks used by this ring are ingenious.

A man who kept a post card and stationery store was arrested recently. He frequently received shipments of fancy post cards from abroad. They were novelty cards that had objects fastened on their surface. A veteran of the service managed to get some of the cards. He found that one of them, a woman's slipper, contained within the cloth toe of the fancy brocade a considerable amount of "dope."

There are among the exhibits of the police and Federal departments at San Francisco and also at New York shoes that have been torn apart. Between the leather and the insole and secreted in the heel was found a considerable amount of opium or some other narcotic.

It also is smuggled in by letters and parcels of every kind, in bottles, in suit cases, even in the handles of umbrellas, in anything that is apt to pass through without too close scrutiny.

The government recently sent out word from Washington to press the fight against the international drug ring. In the last few weeks big hauls have been made in many large cities.

Representative Rainey, of Illinois, recently investigated the matter of drug users in the United States and now asserts that they number 1,988,000! This is a startling fact.

Those who have the best interests of the civilized peoples of the world at heart are alarmed at present conditions in regard to opium and other drugs, such as cocaine, heroin and morphine. It is only with an enlightened and an active public opinion that the work of the cunning international ring can be stamped out.

California celebrates. It is the biennial destruction of confiscated opium and opium layouts, together with other narcotics, such as morphine and cocaine.

This is one method of smuggling opium. Opium has been found concealed in shipments of olive oil, in children's hair and in a myriad of other things.

This is an opium "layout" taken in a raid. There are the pipes, the mortar, the lamps and the bottle of oil and spirits.

A million dollars' worth of drugs which were seized recently by the Federal narcotic squad.

Even State Governors Err on Occasion

By HARRY PENCE

SIDNEY J. CATTS, former governor of Florida, was recently arrested after indictment for alleged bribery. The charge was that while governor and an ex-officio member of the State Board of Pardons he accepted a money consideration for his vote in favor of pardoning a man convicted of murder.

Former Governor Horace F. Graham, of Vermont, became the executive of his state after holding the state auditorship for 13 years. He was governor of the state for two terms of two years each. It was while serving his second term, in August, 1918, the charges of embezzlement of state funds during his terms as state auditor were made. He was subsequently indicted, tried, convicted and sentenced to imprisonment for from five to eight years. Considerable restitution had been made and on the day sentence was passed, November 4, 1920, his successor, Governor P. W. Clement, granted him a full pardon on the grounds that he had already been sufficiently punished.

A number of governors have been impeached and in some cases the impeachments have been sustained, thus removing the accused officials from office. To a greater or less extent political motives have prompted and animated such prosecutions.

The Downfall of Sulzer

PERHAPS the most conspicuous case was that of Governor William Sulzer, of New York. Sulzer represented a New York City constituency in Congress and won the title of the "poor man's friend." At his inauguration as governor he was hailed as the "people's governor." In his campaign he had made promises of election reform, but the measures by which he proposed to bring these about did not suit the leaders of his party in New York City, whom he further antagonized in the matter of appointments.

The fight was as picturesque as it was bitter, and resulted finally in the complete defeat of the governor. His political antagonists introduced and passed an unsatisfactory "primary election" bill which he vetoed and then defeated his measure on the same subject, a maneuver that gave the public the impression Sulzer had himself opposed the reforms he was committed to sponsor. He was accused of perjury, sued for breach of promise of marriage and his final undoing was brought about by charges concerning the sources of money said to have been contributed to his campaign fund. He was impeached, tried before the state senate and supreme court and removed from office October 18, 1913.

Governor Charles Robinson, of Kansas, became involved in a state bond-issue deal with the result that in 1862 he, with the state auditor and the secretary of state, was impeached for alleged fraud. The state needed money and bonds were issued and offered to the only prospective purchaser, the United States Government, to be acquired as an investment by the administrators of a fund held in trust and usable for such purposes. The methods employed, however, seemed not to have been legitimate or above suspicion, but it was not shown that Governor Robinson participated in the deal or profited by it, so he was acquitted, although the other two state officials were convicted and removed.

Governor Harrison Reed, of Florida, was the next impeached, in 1868. Although charges of embezzlement, corruption and bribery were made against him the prosecution seems largely to have been political. A new legislature, chosen at a regular election, met and dropped the entire action.

Holden and Ku Klux Klan

IN NORTH CAROLINA, in 1870, Governor William H. Holden ordered the militia to the scene of a number of disturbances which were charged against the original Ku Klux Klan. The militia officers made many arrests and refused to obey writs of habeas corpus issued by the local and higher state courts. The governor was impeached and convicted of bringing in troops from another state and illegally suspending the right of the writ of habeas corpus. He was removed from office.

The late General Powell Clayton, of Arkansas, was elected governor of the state in 1868. He faced bitter political opposition, including the lieutenant governor, whose removal he sought. For this he was impeached, charged with various illegal acts and high-handed conduct, and to prevent his escape his antagonists barricaded him in his office in the state capitol. He escaped, however, and carried his fight to the people in 1871, with such success that not only did the new legislature drop the charges against him but elected him to the United States Senate.

In the same year, 1871, Governor David Butler, of Nebraska, was removed from office by means of impeachment and trial, the charge being the misappropriation of state funds.

The proceedings against Governor Henry C. Warmoth, of Louisiana, in 1872, were dropped because his term of office expired before they could be pressed to a conclusion. He was charged with attempted bribery and political factionalism.

In 1876 Governor Albert Ames, of Mississippi, was impeached on a number of charges, the gravest of which were the manipulation of prison labor contracts to his individual advantage, the sale of pardons and inciting race riots. He resigned and the charges were dropped.

Here's an Idea!

DEMOCRACY is on trial—it is ever on trial. Despair is expressed because in New York, in Boston, in Chicago are found enthroned administrations that are notoriously representative of the worst elements—the elements associated with commercially organized vice, bootlegging, bribery and corruption and with systematic violation of the law of the land. If the decent citizenry had been disfranchised they could have hardly less representation.

These mayors, city councils, public prosecutors, and even minor magistrates, include officials who are themselves under indictment for felonies. Many are notoriously in league with the alien enemies of the American Republic and openly scoff at its best traditions and ideals. But they all were triumphantly swept into power in recent elections by phenomenal majorities over and against the protests of an almost unanimous press and of nonpartisan "reform organizations" whose pitiable weakness is become the butt of sneering jest on the part of the victorious corruptionists.

On the surface, the Plunderbund seems to be justified in basing its usurpation of office on "the people's mandate." A count of votes seemingly names them as "the choice of the electorate." To the superficial view, that appears to settle it. But let us go behind the returns. Our republican system of government was designed to establish and perpetuate "a government of the people, by the people and for the people." To prostitute its electoral forms and methods for the defeat of the people and the seating in power of a government of the enemies of the people, by and for those enemies, is a reversal and degradation of their true purpose.

Our naturalization laws require of the alien applicant for American citizenship a solemn oath explicitly renouncing allegiance to any foreign power and pledging undivided allegiance and support to the Constitution and the laws of the United States. A violation of that oath constitutes perjury and perjury is a crime punishable by imprisonment, *and deprivation of the rights of citizenship.*

Here is a weapon ready to hand for the defense of democracy and democratic institutions against the assaults of the alien enemy within our gates and of the native-born American found recreant to the American faith. The conviction of crime carries with it disqualification for citizenship. Let honest watchers be put on guard at every polling place charged with the duty of challenging the vote of any and every man or woman convicted of crime. Further, let every would-be voter reasonably suspected of having violated his oath to support the Constitution and the laws be held to answer for the charge of perjury over and beyond prosecution for the specific violation charge. Perjurers and other lawbreakers *are not legal voters.* Their ballots, if sneaked into the ballot box, should be thrown out on canvass and scrutiny of the list of voters. They should be prosecuted for violation of the election laws.

Any Change Must Be for the Better

EASTERN financial interests have voiced grave disapproval of the amendment increasing the membership of the Federal Reserve Board by one and directing that the President in appointments have due regard to fair representation of the financial, industrial, agricultural and commercial interests and geographical divisions of the country.

Opponents of the measure profess to see in the demand for a "dirt farmer" as a member of the Federal Reserve Board, a dangerous tendency toward class legislation. The measure as passed by the Senate contains no mandatory clause as to the personnel of the board, although the prior law specifically provided that two bankers be included in the membership.

The incongruity of the idea that it is class legislation to suggest fair representation for several groups and not class legislation to command fixed and almost controlling representation for bankers will probably never appeal to the critical financial interests. It is a trait of human nature to take one's own viewpoint with utmost seriousness. Banking interests have long held firmly to the belief that their fiscal views should be controlling as to the disposition of the country's wealth. For a great many years the idea has been cultivated that it is almost profane for non-banking hands to touch the financial edifice. The Senate's action is a somewhat belated recognition of the fact that the interests which produce the wealth of the country should be consulted regarding the way it should be handled by institutions which are merely trustees.

"Fair representation" should insure a greater caution in manipulating financial levers, than that which has obtained during the last few years. The rapid changes of the re-discount rates by the Federal Reserve Board in 1920, whatever the motive which may have inspired them, were taken advantage of by shrewd stock operators in "bull" or "bear" movements on the stock exchange, while small investors in legitimate enterprises far from the stock market were made sufferers by the artificial pressure upon the loan agencies.

The governmental agencies like the Federal Reserve Board should be like Caesar's wife. For their official actions, however meritorious the object, to be capitalized by professional stock gamblers is unpleasant. It is to be hoped that the Congressional move will mean that opportunities for such practices will be minimized.

Moliere's Tercentenary

DR. NICHOLAS MURRAY BUTLER, as chairman of the Franco-American Committee, has been advised by the French Academy of the appointment of M. Donnay to represent the "Immortals" in the American celebration of the tercentenary of the birth of Moliére. The anniversary should do much to revive and deepen interest in this country in the work of a dramatist hardly second to Shakespeare in genius and influence.

Like Shakespeare, whose tercentenary was celebrated the world over in the midst of war's alarums only a few years ago, Moliére belongs not to any one age or country, but to all lands through all time. Accumulating vogue through a period of three hundred years is in itself demonstration at once of vitality and universality, acid tests of the true classic.

Comparisons become superfluous on the plane of these giants. True genius is always original. It so happens that by general agreement Moliére remains to this day distinctly the greatest of satirists in any literature. His supremacy in this particular, however, in no way dims the luster of the myriad-minded Bard of Avon.

It is natural enough that the brilliance of Moliére's plays should shine to greatest advantage when presented in his own tongue. The great Frenchman has been fortunate in the tradition which has continued generation after generation to bring to the interpretation of his works such a company as that of the *Comédie Française,* often called the "House of Moliére," a company inspired by noble ideals and rigorously maintaining its high standards in the dramatic art.

Even Shakespeare suffers much in translation. But, as the last year or two has witnessed the successful presentations in Paris of new and striking French versions of "Romeo and Juliet," "Hamlet," "The Winter's Tale" and "Midsummer Night's Dream," so it may be expected that some day there may be brought before American audiences English versions of Moliére's comedies in which the best talent of our own day may help to stir the minds and hearts of theater audiences with the wit and humor, the wisdom and subtlety of the "Misanthrope," "Doctor Despite Himself," the "Imaginary Invalid" and the "Wise Women."

Like every true genius, Moliére was a pioneer and, it might be said, an iconoclast. He broke away from the stilted and conventional literary fashions of his day both in his treatment and his choice of subjects. Courageous as he was brilliant, he did not hesitate to incur the disfavor and even the persecution of those whose armor was pierced by his shafts. And it is certain that in our day, as in Moliére's lifetime, there is call for his subtly refined and correspondingly effective satiric puncturing of hypocrisy and pharisaism; need for the comedy that pillories charlatans and fops, pretenders and pedants, showing the constant motive forces of universal human nature with a depth of understanding and refinement of method, strikingly in contradiction to much of the materialistic and cynical stage productions of the passing day.

Things Wrong With the Theater

IN A recent number of the *Billboard,* a reviewer for that robust and sprightly journal of real criticism and opinion, Patterson James, treats his readers to some candidly phrased and direct plain speaking that should have a wholesome influence. Tackling present-day developments of managerial arrogance eloquently expressive of contemptuous disregard for the comfort and convenience of the theater patrons whose money he takes, Mr. James says right out in meeting some things that most of us have been thinking, but have been too cowed by the might and power of the lordly white-shirt fronted managers to let ourselves utter. As a result, we have earned the scorn and overbearing attitude which the Oriental ever manifests toward those who supinely submit to his tyranny. He feels that he can safely despise those stupid enough to take his insolence "lying down."

It will be a wholesome thing for the future of the American drama, silent as well as spoken, when theatergoers summon pluck enough to vent honest indignation against this managerial oppression. One of the abuses of power against which our unafraid critic protests is that in this land of the free and home of the brave, as in no other land under the sun, "if you hiss in a theater you are an anarchist and hustled off to jail, and if you cheer you are a law-abiding citizen . . . . There is no reason in truth or justice or charity why a man who buys a ticket to see a show should not be as free to express his displeasure at his bargain as his delight over it."

Summing up, Mr. James puts the whole case in a nutshell: "If managers will reduce the prices of admission to a reasonable figure, stop playing 'whole hog or none,' look up some decent plays and refrain from collusion with ticket speculators, the business will be all right." And he formulates the "things that are the matter with the show business" as follows:

"1. Too high prices for worthless shows. A two-dollar top is enough.

"2. Plundering 'the road' by fake 'original New York' companies at outrageous prices with the natural reaction against all sorts of shows.

"3. A complete and total loss in the integrity of managers by reason of their unscrupulousness.

"4. Resentment of all classes of theatergoers against commercial filth.

"5. No money to waste on shows, when food, clothing, rent and fuel are so high."

Correct diagnosis is half the remedy, according to a medical axiom. It is an axiom which has obvious application here.

Oregon to Vote on Single Tax

THE people of Oregon are to vote for the second time on a proposed constitutional amendment to institute the single tax. To make the change gradually and allow time to adjust loans on mortgages and other securities based on land, it is to be spread over five years beginning July 1, 1923. A similar proposition in the election of 1920 received 37,250 votes, while 137,000 were cast against it. This year, the Single Tax League which has been growing considerably of recent years as a "middle-of-the-road" third party, proposes to wage a vigorous campaign for the amendment, and it is likely that the fight will have much more than local importance and interest, Oregon being the first American state to vote on the measure, although it has had trials in Wilmington, Delaware, and Houston, Texas. It has, moreover, been in successful operation for years in the Malay Free State, in several important Australian cities and, to a limited extent, in New Zealand.

The quintessence of the Single Tax proposition is that the full rental value of all land, exclusive of improvements, being the value given to the site by the community, should be taken by the community for community purposes and benefits, relieving the people from other taxation, Federal, state, county and municipal, to the extent which this "land-value" (not land) tax shall suffice to defray the expenses of government. It is contended that eventually, when the system is in full operation, it will displace all other taxes—hence the "single" tax. The revenue thus provided being more than ample to meet all ordinary expenses, it is contended, will also allow for liberal provision for good roads, education, public parks and playgrounds, art museums, while the exemption from burdens of labor and the fruits of labor must immensely stimulate enterprise and production.

From which it would appear that Truth in this, as in so many cases, wears the garb of paradox. For the Single Tax is not a tax!

Mr. Ford's Page

WHEN the passing of city life is discussed, and the rediscovery of the small town is affirmed, one of the commonest questions to arise is this: "What are your small towns going to do for the advantages of the city—the theater and entertainments, for example?" That is the form in which the question usually comes, with an anxiety about the "theater and entertainments."

The question assumes two conditions: First, that a majority of city people attend the theater and other entertainments to such an extent that these institutions have become a necessary element in their lives; and, second, that the theater and entertainments normally fulfill the human desire and need for recreation. Neither of these assumptions is true.

It may be found to be just a question whether the theater is as popular—in point of attendance compared with the population—as it was 50 years ago. The totals are larger, but it may be doubtful that the proportions are. We are not half so theater-mad as some people suppose. The proportion of regular attendants, people who haunt the theater, who are always looking over the list of shows for "a place to go tonight," is not very great. In a certain city where it was assumed that the theater was carrying everything before it and that church attendance was a contemptible little quantity in comparison, it was found that the church with one day a week excelled in drawing power all the legitimate theaters of that city with seven nights a week and two matinees. Leaving the modern theater would not be such a terrible loss, as tens of thousands who have moved to the small town can testify.

And as to the "entertainment" values of the modern commercialized amusement enterprise, the bored audiences of any large city bear eloquently silent witness. The fresh, blithe wholesomeness which reproduces the childishness of human life is lacking. Real entertainment is lacking and would be undoubtedly considered as amateurish, so depraved has the public taste become through bedroom farces and bathroom dramas. Those who are inoculated with the sordid sensuousness of the stage would undoubtedly miss that kind of thing in the small town, just as the drug addict, locked in a sanitarium, would miss his favorite poison.

However, that still leaves the question where it was: what are the small towns to do for recreation, for the indulgence of the play spirit? The play spirit is a part of life. Its misdirection leads to harm. In youth especially it is a safeguard, in maturity and age a recreative force. Temperaments differ, but taken by and large the human race *will* play.

There are, however, no profits in mere playing. That is the reason amusements became commercialized. Instead of play, there arose the spectacle. People ceased to play, and watched players. Football is a husky game, but of the thousands of "fans" who shout for football, how many take the risks of it? The same is true of baseball, it is called "sport" to sit on the bleachers and boo or boost. We are mere spectators; other men do the so-called "playing," and because we are merely spectators their playing is not Play at all, but work. There is no community of entertainment and enjoyment, there is no participation.

In the small town of the future there will be a Little Theater, and the play instinct of the people will work itself out through themselves, not by wage earners called "actors" or "players." There will be many actors and players, of course, but they will not be under the commercial domination which every sincerely devoted actor and player feels today. The great geniuses in the dramatic world will still have their vogue—or, to state it more accurately, their vogue will return, because in these sad days dramatic genius is not necessary. The art of play will be like the art of music, imported into the community for daily consumption, and not retained in the concert hall as dramatic art is retained in the modern theater. The theater as a servant of life is being tided over these destructive times by the Little Theater which is springing up in small communities, where the people are developing themselves.

The commercial monopoly of this natural phase of life is being broken. And why not? If, when a writer completes a story, we may all have a copy of it to read in our own homes; why may we not also have the play of the playwright, interpreted in our own community by our own people in our own way? The question has been answered. The flow of people back to the country places is bringing with it these new possibilities. And the benefit is double: the country is being lifted out of the crude and inexpressive practices into which its play exercise degenerated for the lack of inspiration—*and*—the people from the city are being benefited by the wholesome restraint which comes from amusements which have their rise and issue in the same community.

That is a point well worth remembering: when the community shall provide its own recreation and entertainment out of its own resources and by means of its own people, indecency will simply automatically disappear. Why? Well, consider what constitutes the present situation: a theater audience gathers, a few hundreds from a city of half a million or a million people, an audience of strangers. The shield of anonymity protects them all. Young women are there, but they reflect that no one knows them. The people on the stage are from another city, strangers, too. The condition is ideal for putting across anything which common shame would otherwise prevent.

Now, in the home town, with the home folks in the chairs and home folks on the stage, it would simply be impossible—there is not enough brazenness in human nature to permit home folks to enact bedroom farces before home folks, or to revel on the stage in matter that would not be permitted within a thousand miles of any home-town parlor.

That will be one of the effects of a return to the small town, and a necessity of drawing upon the community's creative powers to supply the normal need for entertainment.

Of course, the principle extends further. Reference has been made to amusements only because it was involved in the question which has been asked. But the principle applies to every element of community life. City living has made us entirely too dependent. City dwellers will soon lose the art of building fires. Most of the other domestic arts are "lost arts" already. And the art of providing entertainment or amusement for ourselves was about to disappear.

The ideal community is self-sustaining to a greater extent than any community now is. If near flowing water, every community should be self-sustaining in matters of power, heating and lighting. Every community in the midst of an agricultural district should be self-sustaining in the matter of food. The grain grown near by should be milled near by, a sufficient supply reserved and the surplus sent to the great centers of consumption. Each community should be constructed out of materials near at hand, and thus preserve unity with its basic soil. And each community should derive from the wellsprings of its own life those finer inspirations and recreative activities which put a bloom and a flavor upon life. It is all contained in that principle known as "self-development." The reward of self-development should be self-sustenance, with the community as well as with the individual.

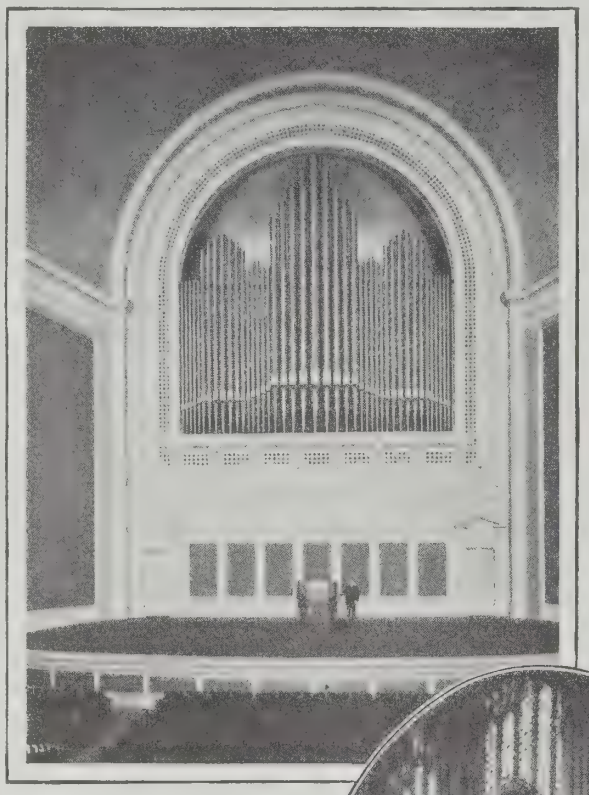
WHEN people first think about the flow of population from the city to the small towns they inquire how life can be lived without certain elements of city life, particularly of the lighter social kind. The answer is that the smaller communities, peopled by the right kind of folks, will provide themselves with all that is necessary to a wholesome, normal life. Every community should be self-sustaining, and no city of the present day is. The city is absolutely dependent for everything: all it has is brought into it. The smaller community is in the midst of its supply and is better fitted to sustain itself, materially and socially. We need less waiting on and more self-help.

Marvels of the Wonder Musical Instrument

By R. P. CRAWFORD

ONE sees only banks of keys, a bewildering array of little tablets and knobs, and all sorts of pedals, and yet under the hand of a master the pipes of the organ 50 or 60 feet away speak forth in all their richness and brilliancy. The most wonderful, the most mysterious and the most complicated instrument in the world is the modern organ.

The greatest musical story ever told is that of the organ. There is no instrument that affords such an infinite variety of tone, that requires so much skill to master, or that offers such latitude in manufacture. The pipe organ of today includes practically every instrument of the modern orchestra, and then many kinds of sound that are not to be found in the orchestra. It may have thousands of pipes, and often a hundred or more stops, or separate musical instruments, so to speak, included in its vast domain of musical sounds.

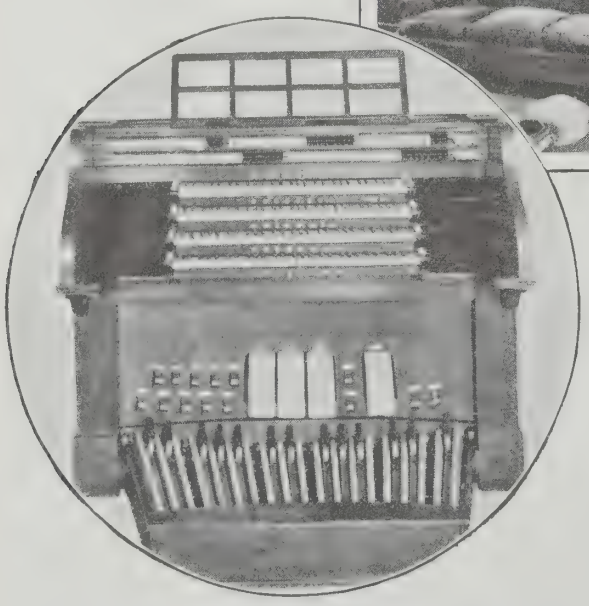


Americans are no longer dependent on Europe for a glimpse of great organs and an audience with the king of instruments. It has all come about suddenly, this great revolution and development of the organ.

An American department store holds the record for the largest organ in the world, with 232 stops and 17,954 pipes. This Philadelphia organ eclipses the cathedral organ at Liverpool, England, and the Town Hall organ at Sydney, Australia, both notable instruments, as well as German organs. A few years ago it was entirely out of the ordinary for an organ to have more than 100 stops, but today that number is found in many organs in the United States. The sudden advent of municipal and theater organs opened a new field and made possible very large instruments. The famous organ in the Mormon Tabernacle at Salt Lake City was recently completely rebuilt, so that it has about 125 stops and it has again become one of the great instruments of the world.

Probably the largest pipe organ order ever placed was given out the past year by the University of Rochester, Rochester, New York. It included one organ to have 154 stops, another organ with 94 stops, two studio organs with three banks of keys, and nine organs with two banks of keys for students to practice on. A contract has been let for a Cleveland municipal organ with more than 150 stops and to cost $100,000. A Chicago theater recently installed an instrument with 209 stop keys, although, of course, these were not all speaking stops. It was announced a little while ago that a Philadelphian had offered his city $120,000 to build the largest organ yet constructed. Portland, Maine; Denver, St. Paul, San Francisco and a score of other cities have municipal organs, where concerts are given regularly. It formerly was quite out of the question for a church to spend $50,000 on an organ, but there are many such in the United States today. Many wealthy individuals have placed pipe organs in their homes, playing them with rolls of music like player pianos.

What is the significance of all this organ fever? It simply means that America is rapidly taking the lead of the world in organs. Nearly every steamer brings one or more organists from the Old World cathedrals and churches, who set out to try their fortune in the United States. Most of them tour the country giving recitals and when a good offer comes their way they accept, and settle down in America. America is rapidly developing many organists of world reputation, both as concert players and composers, and American inventive genius has outstripped scores of the great organs in other countries.



The greatest marvel of the organ today is perhaps not so much the harmonies that come from its depths as it is the wonderful mechanical developments that make this music possible. An organ builder must, of course, be an artist at his work, but when it comes to making possible this great instrument of today, at least half the job is just downright mechanical and inventive genius. Under the old system of building organs it would be impossible to play any of the huge modern instruments. No man would have strength enough to hold down the keys when playing on the full organ. And so electricity has come to the aid of the organ builder, as it has to the aid of so many other builders of modern civilization.

This is the organ that served at the San Francisco exposition and is now in the city auditorium in that city.

The organ in St. Thomas' Episcopal Church, New York City, one of the large church instruments in the U. S.

The console or keyboard of the organ in the city hall at Portland, Maine, one of the large municipal organs in the country. The tablets above the banks of keys are stops and couplers. The buttons between the keys control groups of stops. At the very base of the console are seen the pedals, representing bass notes, which are played with the feet. The broad flat pedals above the pedal keys regulate the volume of sound from the organ.

Many pipe organs are being installed in residences. These organs are played from rolls of music like player pianos. They are especially voiced to resemble an orchestra.

Today the keys of many organs are so susceptible to pressure that a breath of air will move them. It formerly required a finger force of two pounds to depress a single key, since one actually did all the work of opening the pipes with the fingers. No wonder the great majority of organists were men!

But today imagine hundreds of little telegraphs all carrying messages from keyboard to organ. Every time a key is depressed a tiny current of electricity operates a magnet and opens a pipe. That accounts for many organs being divided into several sections and scattered about an auditorium or theater, with the keyboard, or console, perhaps 100 feet away.

Solo, swell, great, choir, ethereal, echo, string organs —this medley of names is almost enough to dissuade anyone from trying to describe a modern organ. The largest organs today have five banks of keys, or manuals, as they are called. Each one of these really represents a separate organ with its own peculiar quality of tone. The smallest pipe organs of any pretense at all have two banks of keys and a row of pedals, representing the deep bass tones and which are played with the feet.

One is reminded of the great discussion that the church committee was having over the new organ. "Mr. Chairman," said Deacon Smith, "I don't see why we should have a great, a swell, and a pedal organ. I should think that one organ would be enough."

Deacon Smith, however, was a tailor, and the other deacon engineering the organ proposition responded, "Deacon Smith, you wouldn't say that a man was properly dressed with only a coat on. You would want him to have a coat, a vest and trousers." And so the two-manual organ with pedals was finally installed.

On a two-manual organ the first row of keys is the swell organ and the second row the great organ. On most pipe organs no matter how hard one presses the keys the volume of sound is always the same, and the swell organ gets its name from being inclosed in a box with shutters, which, opening and closing, regulate the volume of sound. The great organ has the loud stops of the organ. The only way the sound can be increased is by adding more stops. A very few large instruments have what is known as a double touch, where by giving the keys a little extra pressure additional stops are brought into play.

But when it comes to the really large instruments, there is enough to tax the brains of an organist. In addition to playing with both his hands and his feet, which is quite an art in itself, an organist often has to keep in mind some 200 stops, couplers and mechanical accessories. The console, or keyboard, of a really huge instrument is an interesting sight.

First, there are the banks of keys. On a four-manual instrument, the first is usually the solo organ, its pipes being just what the name implies; then come the swell, great and choir organs, the stops of the latter usually being a little subdued and especially suitable for accompanying a choir. There may be five manuals, with perhaps an echo organ, but more often there are simply four manuals, and the echo organ is played from one of the other rows of keys. Some organs today have a special string organ, imitating the orchestra, but this is usually played from one of the other manuals, or perhaps so arranged that it can be played from any of them. Often its stops are simply incorporated in one of the other organs. An ethereal organ may contain stops of tremendous power and be located 100 feet or so up in the very top of the building. In fact, there is almost no limit to the subdivisions of the modern organ.

Usually on both sides of the keys and above the keyboard one sees scores of knobs or little tablets. Each one of these is a stop or coupler, or some other mechanical accessory. A stop brings into play a row of pipes, and is the same as adding another instrument to the orchestra. The couplers serve to make it possible to bring into play the keys an octave higher or lower than those one is playing, and also to couple together practically any rows of keys.

The development of theater and residence organs, together with concert organs for town halls, opened an entirely new field in organ building. There immediately came an insistence on greater orchestral tone and less insistence on the traditional churchly quality of tone. Theaters usually installed an organ either to eliminate the orchestra altogether or to give it an occasional rest. Persons who installed organs in their homes wanted to play overtures as well as church tunes, and so it came about that the modern organ has changed considerably. There are organs today that have a grand piano attached. On some theater organs the second bank of keys is a piano as well as an organ. Even the percussion instruments, such as drums, chimes, sleigh bells and the usual oddities of the orchestra, are found on many instruments. The harp effect, which has become so popular on many organs today, is procured by a row of metal or wood plates, placed over resonators, and struck by padded hammers. There is, however, one organ which to my knowledge makes use of a plucked string to obtain this effect.

Many large residences now have pipe organs, thanks to the development of player attachments. These player organs relieve a person of all the details of organ playing, automatically adding appropriate stops when called for by the music.

But there is no instrument in the world where so much is left for the performer. It is as if an entire symphony orchestra was set before him. He may take a simple tune and develop it in a score of different ways. The horn-like tones of the oboe may give way to the flutes; there may be the soft music of violins; in the very back of the church or auditorium may be the organ's own choir of delicate voices, reproduced by the vox humana on the echo organ, a stop surprisingly like a choir of human voices when heard a distance off; there may be the tolling of bells; or there may be the crash of the brass instruments of the orchestra, or the heavy roll of the diapasons, which form the very foundation of organ tone and have no counterpart in the orchestra. There is no limit to what may be done on a large instrument, a thousand and one possibilities confront every organist, and what he does or does not do, shows his musicianship.

French North Africa—the Last Frontier

By HAL WALKER

ALGERIA is both historically and naturally the most picturesque and interesting section, for its size, on the globe. Yet it has great undeveloped resources that call for American machinery for modern agriculture and manufacture, and hundreds of thousands of people who would buy American manufactured goods. French North Africa (which includes the colony of Algeria and the two protectorates of Tunis and Morocco) is in reality the "last frontier." Little known outside France except to the confirmed globe trotter and the pioneer business man, mostly British or German, this great territory, washed by the blue waters of the Mediterranean on the north and extending into the unknown Sahara, the Garden of Allah, on the south, has an appeal of romance nowhere equaled.

Algiers, the principal port and capital of Algeria, lies in about the same latitude as Norfolk and San Francisco in the United States. It has a population of more than 200,000 and in its streets and around its mosques Europe-

On the edge of the desert, Algeria.

Harbor of Algiers, from the Arab city.

The water front of Algiers.

An old square, Figuig, Algeria.

pean and Arab touch elbows in the throngs. Backing a port, made modern by an extensive breakwater, rise row on row flat-topped Moorish houses punctuated at frequent intervals by mosques. This ancient city of narrow, climbing streets rubs shoulders with the modern city at the *Place de Gouvernment* on the sea; and mysterious, veiled women and Arabs from the desert in their flowing robes, in the city of broad streets, automobiles and electric cars, give a touch of the bizarre to an otherwise twentieth century atmosphere.

As *Alger, la Blanche,* or the "white city," this former stronghold of the Barbary pirates is known to the French and foreigner. As a port, Algiers ranked second in French territory before the war, being exceeded only by Marseilles in the tonnage passing through it. The port is the gateway to the wonderful Kabyle Mountain Land, the fastnesses of the Atlas Mountains, the ancient Roman cities to the south and east, such as Constantine and Timgad, to say nothing of ancient Carthage in Tunis even farther afield, and then the wonders of the Garden of Allah, which is approached from Biskra.

Africa conjures up the thought of a place off on the edge of nowhere, inhabited by savage people and where the camel and donkey are the only means of travel over trackless sands or almost impassable trails. Such is not the Africa of the French along the northern rim of the great continent. The traveler can go along the whole north coast by railway and in modern sleeping cars, yes, even to the edge of the desert at Biskra, and he can make this journey also by his own automobile or in the great touring busses of the Compagnie General Transatlantique, the big steamship company which operates from Havre to New York City, to the West Indies and South America, and also to North Africa from Marseilles and Bordeaux.

Only 26 hours sail from Marseilles in modern steamers, and less than 48 hours from Paris, this exotic empire is as accessible from the "centers of civilization" as anyone could wish. This North African country should certainly hold a strong attraction for the adventurous American traveler. With its magnificent roads for touring, its first-class hotels and its comparatively cheap transportation and living conditions, to say nothing of the attraction of Roman cities. Timgad, for instance, is thought to have had once a population of 50,000 persons; it possessed magnificent baths with hot and cold water, swimming pools, a theater which seated 2,000 persons, a public library given by the Carnegie of that day and country and a forum of gigantic proportions.

A fact that will come as a surprise to many is that the French colonies and dependencies have an area roughly estimated at 5,119,138 square miles, with a population of about 58,582,905, this colonial and dependency area being about twice that of the Continental United States. Of French African territories, Algeria probably is the most important, with an area of 222,580 square miles and a population of 5,563,828, Mohammedan and Christian. Algeria proper comprises the coast land along the Mediterranean, the high plateaus and then the desert regions south beyond the mountains.

The climate in general resembles that of Southern California, and the season for visitors begins in October and ends in May. The summer months are so hot that they hardly appeal to the visitor. Algeria's population is Mohammedan, except about 800,000, who are mostly French; but there are about 150,000 Spaniards and 40,000 Italians included in this total, all of whom in addition to the great Moslem population, are potential customers for American goods.

It is this population of Algeria which offers an opportunity for American business, both export and import, a business, which, as far as foreigners are concerned, was handled before the war mostly by Germany, although the British had a small foothold. In the stores of Algiers and Oran, which are the two most important ports and distributing centers of the country, can now be seen a few American goods; more American than any other foreign products, in fact.

Imports into Algeria rank, according to the statistics of Edward A. Dow, the American consul, in the following order: Wearing apparel, cotton textiles, motor vehicles, machinery, especially that for agriculture; leather manufactures, including shoes; metal products, perfumes and soaps, sugar, paper and coal. There is now opening a special market for American condensed and evaporated milk, sugar, coffee, cottonseed oil and rice. On the export side Algeria sends out wine and wheat as her principal items. Following these come tobacco and cigarets, goat and sheep skins, hides, fresh fruits, including oranges, mandarines, dates and figs. Iron ore and phosphates are also exported. To the United States the principal exports at present are hides and skins, cork, brierwood and some winelees for the manufacture of baking powder. Other commodities in which trade could be developed and which are needed in the United States are olive oil, vegetable fiber (used for upholstery), alfa—esparto grass—(used for making paper pulp) and kaolin, or China clay, which is used both for pottery and paper making. Vegetable fiber is becoming known in the United States, but so far not to any large extent. This is because exports in any quantity have been made only since the war, and also because the fiber comes on the Algerian market twisted and it has to be put through picking machines in the United States before it is ready for upholstery work.

Kaolin is found in an almost pure state and has been used for years in the better-class potteries in France and neighboring countries, but little has been shipped to the United States. This kaolin also is of prime use in making the best grades of book print paper.

Of all the export products which possess a big future, probably alfa has the greatest possibilities for the American market. This is due to the large quantities which can be shipped and to the present world-shortage in wood pulp for paper making. In the past England has been the principal customer for alfa, while other European countries have taken smaller amounts. Since 1911 exports of alfa have exceeded 100,000 metric tons a year and in 1912 they amounted to 117,000 metric tons. England has taken, year in and year out, from 90 to 95 per cent of the alfa exported.

Alfa grows in Algeria over several millions of hectares. There are three classes of alfa; that used for making ropes and mats, that for paper making, and that for basket work. The quality for paper making is the most interesting from the standpoint of United States trade. With plenty of kaolin at hand, it would seem that alfa pulp could be made in Algeria, except for the fact that there is an excess of chalk and salt in Algerian waters, but this is being overcome somewhat. One scientist has made from alfa a new type of pulp which he calls "demi-demi," a rough cellulose of alfa which can be transported absolutely dry and pressed into small volume. To transform this demi-demi (half and half) pulp into the product for making paper the only requirement is that it be diluted, washed and finished, then passed into a whitening machine. This demi-demi pulp shipped effects an economy of 50 per cent in freight, or 500 to 600 per cent in volume over raw alfa.

Owing to lack of fuel in Algeria and no developed hydro-electric resources, it is likely that the manufacture of alfa pulp for export for the next few years will be far below the demand, but American production on a large scale could overcome this should paper makers in the States wish to start their own mills in Algeria. If not this, there is plenty of alfa for export, and it has been proved in England to be excellent paper material.

The importation of alfa into the United States would help the American shipping problem in the Mediterranean, where American vessels are returning to America in ballast and have been doing so ever since the war.

Does Gold Make Dollar or the Dollar Gold?

Money the Only Subject Omitted From Public Education: What Can Be Learned From the Money in Your Purse

WHAT the country needs is a public school course—for the pupils of the public schools—in facts about money. The ignorance of even intelligent and educated people on the subject of money is almost apalling. Monetarily speaking, the illiteracy record is 99⅞ per cent.

Introduce the study of money facts into the public schools, and in 20 years the greatest system of fraud and robbery ever devised will be driven out of the United States.

No, not any "money theory." That would be propaganda. Besides, there are too many money theories. Keep the course to *money facts*—strictly and jealously to money facts. Don't teach a single thing with which the most reactionary financier would not agree. Let the whole financial oligarchy put their O. K. on every item that is to be taught. But see to it that they don't slip any fact into the discard.

Money facts are all that is necessary to throw light on the stupid and unworkable system under which humanity is limping along, and under this light the readjustment and reform will take place.

If even one man in a hundred knew, thoroughly knew, the facts about the money that he has in his pocket—yes, if even one man in every thousand of our citizens knew; if he could take out any piece of metal or paper money and tell exactly where that piece of money fits into our monetary system, it would make a difference very dangerous to our present fraudulent methods.

Consider that simple though serious statement. Think of the tremendous effect of our ignorance, when it can be said that if one grown man in every thousand knew as much about money as every school boy ought to know, it would effect a salutary revolution in the money system.

Did you ever stop to think that they teach nothing about money in the plain people's schools—in the schools which furnish the greater portion of our population with all the schooling they ever get?

You yourself will probably fumble around among your few pieces of money, utterly lost when it is sugested to you that your pieces of money don't all fit into the same money scheme at all.

All your money is not always money for all purposes. Not that *you* need be alarmed, because you are in the class where your money is not sufficient to bother those who manipulate the money system. Your money is good for bread. But no financier in the world wants a million dollars' worth of the money with which you buy bread. He would not take it. He will write it into his contracts that he will not take it. Moreover the law of "legal tender" will defend him in not taking it.

Just as a little lesson in the structure of our very peculiar money system: How much "legal tender" have you in your pocket?

You bring out a handful of pennies and nickels. Maybe $2 worth in all. For the purposes of tendering legal payment for any debt your $2 is worth just 25 cents. The money you have pulled out of your pocket fits into the "minor coin" classification of our monetary system, and its "legal tender" use is limited by law.

Suppose you bring out $20 in halves and quarters and dimes. You have then entered another classification, you are in the region of "subsidiary silver coins," and if you want to pay a debt you may find, according to law, that you can only extract $10 worth of "legal tender" from your $20. All the money is good, but it is not all good for legal tender in the payment of an obligation.

A silver dollar, a ton of silver dollars, fifty tons of silver dollars are "legal tender" for the value stamped on them, "except where otherwise expressly stipulated in the contract." That is, the silver dollar can be bodily thrown out of the "legal tender" class by the scratch of a pen.

Maybe you pull gold out of your pocket—unlikely that you can, but just suppose. Between yourself and your ordinary fellow citizens that gold will pass for what is stamped upon it, a $10 gold piece will pass for ten dollars, a $20 gold piece for twenty dollars. But even gold is not absolute legal tender for the money value stamped on it, but for what it weighs on the scale. Gold is not money; it is a commodity, sold by weight—except among the common people.

If you pull out gold or silver certificates—the "yellow backs" that some people prize so highly, and the certificates of silver deposits in the United States Treasury—why, previous to the day before Christmas, 1919, gold notes were not legal tender but on that day, December 24, 1919, they became legal tender. How? By "fiat"! By the fiat of the United States Congress! So, since that time gold notes are legal tender, but silver notes are not!

Federal Reserve Notes, Federal Reserve Bank Notes, National Bank Notes—none of these is "legal tender," though they are perfectly good money. They are good money for two reasons: the people will receive them and the government will receive them.

At bottom "legal tender" is a device to protect what are called "large payments." That is at the basis of the gold standard, the security of "large payments," which means the security of Large Dealers in Money. You, Reader, will take all of any kind of money you can get. The real money-wise men won't. Even now there is kept in circulation the kind of money that financiers want to keep out of the banks—it is all right for you, it is not desirable for "large payments."

Why not start a school in Money Facts, and educate the children. Let the O. K. of the financial powers go upon it, but let the plain facts be taught and learned and reflected upon.

Study the make-up of our monetary system. Like everything else human, when you get a full view of it you will wonder how it holds together! It holds together for two reasons—because people have energy to produce and faith to co-ordinate their activities, and because the soil by some miracle of heaven produces once a year the substances which mankind cannot create. That is the basis of it all.

AN ELEMENTARY lesson in the study of money is the difference between a unit of value and a measure of value. The dollar is a unit of value, the expression of the idea. *It is the function of the government to provide this unit.* But the *measure* of value is always the individual judgment of seller or buyer. The government does not fix the price of things, only the unit by which the price is computed. If A desires to sell B a house, the transaction is dependent on agreement between them. A measures the value at, say $6,000, B at $5,000. The government does not pretend to measure the value of the house, but it does establish the unit of value, the dollar. There may be a question about the value of the house; there should be no possible question about the value of a dollar.

Another much misunderstood term in discussing money is the word "fiat." Commonly used to distinguish between paper money and coin, in the sense that government has attempted to make something out of nothing, or give value to something that is worthless intrinsically, "fiat" is given a wrong meaning. All money, regardless of what its commodity value may be, is fiat money. It is the fiat of the government that makes it money.

The Fight Between "Bullion" and "Money"

TIFFANY on Constitutional Law says: "*There is legally no such thing as gold or silver money, or paper money. Money is the stamp of the sovereign authority impressed on that which is capable of taking and retaining the impression . . . . The value is in the stamp, and not in metal or material.*"

Congress has the power to change the weight of metal in the unit of value, without interfering with the legal-tender quality of that unit. Thus the United States Supreme Court has decided that a contract is not to be carried out in the bullion value, but in the money value, where the terms are in dollars. The decision was based on a case arising from an obligation incurred prior to 1831 (at which time the bullion of the gold coins was changed) and paid after that year. The new "fiat" of the government had made a Gold Eagle ($10) that contained but 94/100 as much gold as formerly; that is, $9.40 instead of $10 worth. The creditor demanded as much gold as the earlier gold coin had contained. The decision against this contention was based on the ruling that the contract was based on the legal value of the coin, and not on its bullion value. Going further the court declared that, under the constitutional authority to "coin money," it was not competent for Congress to maintain a parity between legal and market value of gold.

This explains why "financial experts" are today forestalling possible future changes in our coinage by making their loans payable in "gold of the present standard weight and fineness." The courts of Canada, within the past year, have declared such contracts against public policy and have construed a tender of the Dominion's paper money as legal satisfaction of a lien where the creditor had an option of demanding "gold, or current money of the United States," the Canadian paper being at a discount when tendered.

But he would be a hopeful man who would predict such a decision from our own courts just now. The rule set up in the case cited above works both ways. The dollar you owe must be paid in kind, even if it costs you more to get hold of it, for the new contract prescribes that the troy weight and *present* fineness of the metal must govern when the debt is paid.

Another point in the Money Question is the possibility that the United States may be compelled to abandon metallic money entirely. It is not inconceivable that the Money Trust may create such a corner in gold as to make some such measure necessary. With the gold of all the rest of the world already in their possession, and *decoined* into bullion, where is the needed United States gold coin to come from? The money merchants will hold also, as they assuredly do now, all our own present coinage. Gold to meet maturing bond and short note obligations will then be worth —who knows how much? The World War gave us a new vision of man's cupidity in the necessities of life. There never was a moment during the World War when sugar was not to be had in unlimited quantities; but it was hoarded to enable jobbers to extract millions from the people's need by running up the price. One prominent sugar speculator lost half a million dollars overnight when the break came.

Money Is a Transport Agent

COULD the government prevent the gold hoarders from similarly swindling people? The United States Supreme Court in 1884 declared specifically in the affirmative. The case was Juillard vs. Greenman and involved the legality of a tender in paper money. Says the decision: "The question whether at any time in war or peace the exigency is such by reason of any unusual and pressing demands on the resources of the government OR OF INADEQUACY OF THE SUPPLY OF GOLD AND SILVER COIN to furnish the currency needed for uses of the government and the people . . . . is a political question to be determined by Congress, and not a judicial question." This decision upheld the law of May 31, 1878, authorizing the reissue of Treasury Notes, the constitutionality of which had been attacked.

It is part of the study of money to consider the volume needed properly to function. Because it is only as a medium of exchange that money is of use, it necessarily follows that in volume it must be sufficient to accomplish that purpose. Real wealth consists not of money but of the land and its products and labor and its products. To exchange these with a minimum of wastage, money has been created.

As the means of transportation must be available to the field of production, so must the money be at hand in sufficient quantity for exchange of commodities. It follows, then, that any stoppage or reduction of the current of money tends to destroy the legitimate functioning of the fiscal system. The continued flow of investment funds in one direction creates a shortage in the opposite direction. It matters not if the change of current is accidental or the result of design the consequence is the same. But the power to *create* such a shortage is one too dangerous to intrust to any man or class of men.

Not Enough Gold to Serve as Base

DURING the panic of 1907, clearing house certificates —illegal though they were and an evasion, if not technically a violation of the law—served to ease the money stringency. Though not a legal tender in any sense, they were locally accepted in payment for services, the necessities of life, and in trade generally. In Detroit, Canadian currency served the same purpose, while it was not an uncommon sight to see a pay roll counted out in silver dollars.

That the desirability of an "elastic" currency has been recognized for years by financiers, is proved by the evident and stated intent of the laws enacted. The National Bank system was given power of issue to this end. Such also was the ostensible design of the Federal Reserve system. The power of issue was given by law, and under any but an autocratic maladministration of the system the machinery should meet every need. But it has failed and, apparently, was designed to fail.

The purpose of this article, however, is only to point out what seems an inevitable conclusion—that money must be in sufficient quantity to enable business to proceed at an equilibrium; kept elastic, that is, capable of automatic expansion or contraction in volume; and distributed wherever needed. The world's supply of gold is insufficient to allow that metal to serve as a proper money base. Even though all the mines were in full operation, if the gold in the world could be cornered, and it is virtually cornered today, it would be unfit for money, since the owners of gold are enabled to exact an undue proportion of the real wealth of the people in exchange for gold to redeem their indebtedness, public and private.

Keeps Ships Off the Rocks

Unusual Job of an Odd Vessel

By J. M. SEABRIGHT

WERE you ever in a boat on lake or sea beyond sight of land and had lost your way? Lost! What ill that word portends! You felt, doubtless, as if myriads of ants were running up and down your spine.

What did you do to free yourself from your predicament? If the sun or stars were shining you followed the age-old formula for determining directions by facing north, your right hand then pointing eastward. But if the heavenly bodies were hidden by cloud or rain, you, of course, consulted your compass. What a friendly bit of sensitive steel that delicately poised needle seemed! What a comfort when it was your only guide!

What causes this rhythmic dancer of steel to point in one general direction and so become an indispensable aid to navigation? While much remains to be learned about that strange force, we call it terrestrial magnetism, and we know that it radiates in lines from points on the earth's surface called the Magnetic Poles.

Now, the North Magnetic Pole and the geographical North Pole are not coincident. It, therefore, follows that there will be an angle between them at every place on the earth's surface, and that along the so-called agonic line this angle is zero. Moreover, this angle at any one spot varies from year to year. Accordingly, charts have been devised for the use of mariners showing the "variations of the compass needle."

The problem is further complicated by the fact that the Magnetic Poles are not fixed points, and by the knowledge that the radiating lines of magnetic force are not only ever changeable but irregular as well. In the words of Sir John Herschel, the magnetic state of our globe may be described as "one of swift and ceaseless change." In addition, other factors cajole the magnetic needle, such as magnetic storms, deposits of iron ore, islands of volcanic origin, and the iron or steel on the ship itself.

To make a complete study of all magnetic forces, including all the foregoing factors, and to determine the changes continually going on, to the end that magnetic charts may be kept up to date for the benefit of navigator, surveyor and man of science, the Carnegie Institution of Washington has, through its Department of Terrestrial Magnetism, been engaged, since 1905, in a magnetic survey of the world. That it might carry out this vital work on a strictly scientific basis, the institution had built, for this especial purpose, what has been aptly described as "the most curious craft afloat."

The Carnegie, for thus was the vessel christened, is curious because neither jot nor tittle of iron and only a small amount of steel was used in its construction, those substances, as well as nickel and cobalt, most affecting the compass needle. If truly scientific accuracy in observations was to be attained, the craft must be as bare of those metals as possible.

The detailed facts about her construction show to what length the designers went to insure that high degree of accuracy. Imagine a ship built chiefly of wood—white oak, Oregon pine, yellow pine and teak; its fastenings of copper and bronze bolts, locust treenails and composition spikes; its four anchors of manganese bronze, and, instead of anchor chains, three 11-inch hemp cables, each 120 fathoms long; its length, 155½ feet; displacement, 568, tons, and registered tonnage, 246. That, in brief, is a rough sketch of the outline of the Carnegie.

For power the craft depends on 12,900 square feet of plain sail and a 100 horse-power gasoline engine, built entirely of bronze, except for steel valves, cam-springs, piston rings and cam-rollers—an amount of steel so small as to be negligible. This auxiliary power unit can drive her at a speed of six knots an hour in calm weather and gives her a wide cruising radius. When the Carnegie was launched in 1909 this power plant was a producer-gas engine, a steam engine being precluded because of its magnetic nature, but in 1919 a change was made to the gasoline type—a happy move, in view of the present world-wide distribution of gasoline.

The refrigerating plant and cooking apparatus of this unique vessel are of copper and bronze, and her cutlery is of Mexican silver. In short, so bare is she of anything to which the compass needle is susceptible that a wag once remarked that even sailors with "nerves of steel" were, on her, taboo! Strange, indeed, it is, and not a little ironical, that the wealth of a famed steel maker should go to build a craft in which steel is conspicuous by its absence.

A detailed statement of her specifications would be incomplete without mentioning the fact that observations can be made under adverse weather conditions. These magnetic and astronomical observations are made possible in heavy weather by means of two revolvable glass domes which constitute the observatories, these serving to protect both observer and delicate instruments from the elements and, at the same time, permitting an unobstructed view.

It has sometimes been asked by laymen what is the good of acquiring data on a non-magnetic ship when the ships on which such data are to be used are virtually all magnetic ones because of their iron-and-steel construction. Dr. Louis A. Bauer, the director of the Department of Terrestrial Magnetism of the institution, to whom, by the way, belongs much of the credit for the success of the Carnegie's achievements, answers this inquiry as follows: "If the mariner knows the pointing of the compass at a given location, due only to the earth's magnetism and not to that and the ship's own magnetism combined, he can determine the effect on the compass of the iron in the ship and make proper allowance for it. Just as by comparing a house thermometer with one standardized by our Weather Bureau, the necessary corrections can be applied so that fairly correct temperatures may be recorded with the house thermometer.... The compass directions, or angles which the compass makes with the true north and south line, as determined aboard the Carnegie from observations on the sun or stars, are the standard values with which the mariner compares his own values, the differences, if his observations are made with care, being due to the disturbances caused by magnetic influences in his own ship."

The Carnegie off Fortress Monroe.

The Carnegie's scientific personnel.

The Carnegie under full sail.

As to the results obtained, the Carnegie has more than fulfilled her designers' expectations. On her first cruise in 1909 several grievous errors in mariners' charts were discovered within the brief span of six weeks, the effect of which was to set the ship's course to the north of that intended, so that transatlantic vessels plying between New York and Liverpool were taking a course to the northward of where they should have gone, whether moving from the east or the west. And later, along much-frequented routes in the Indian Ocean, the compass-chart errors were found as large as four and even six degrees.

In connection with this brief recital of the errors detected, mention should be made of a further and important feature of the Carnegie's activities, and that is the promptness with which the magnetic data are published. Formerly such information could not be published until years after the close of an expedition, this delay causing a distinct loss in its value; now, on the other hand, the leading hydrographic and scientific establishments are supplied promptly with the results obtained—frequently in from one to two months' time.

Some further idea of the invaluable work of the Carnegie may be gleaned from the statement that she has traveled almost 292,000 statute miles since her launching, or nearly 12 times the earth's circumference. She also has the distinction of being the first vessel to have circumnavigated the globe in sub-Antarctic regions within the space of a single season. This feat she accomplished in 118 days in the years 1915-1916.

The complete mapping out of the earth's magnetic field has necessitated the sending out of supplementary land expeditions. Nearly all parts of the earth have been visited by them, and their activities have resulted in observations being made at about 4,500 points, involving travel of more than 1,000,000 miles. These land parties have penetrated many of the nooks and crannies of the globe under great difficulties and extreme dangers, and have thus contributed to our fund of geographical knowledge—in itself, no small accomplishment. Among such notable expeditions may be mentioned the complete crossings of China, Australia and South America, east to west and south to north; the trans-Saharan expedition from Algeria to Nigeria; extensive canoe expeditions in the interior of British North America to more or less unexplored regions, and to Hudson Bay; hazardous coastal trips in Africa and Central America; and difficult interior trips in Asia Minor and Persia. Just recently the Carnegie returned to her home port, Washington, after having finished her sixth cruise, which covered a period of a little more than two years. On October 9, 1919, she sailed from Washington with a crew of 23 officers and men, for a cruise of 64,000 nautical miles. For the first six months she cruised mainly in the South Atlantic Ocean, completing the work she was doing in 1917, which was interrupted during the World War. Thence, after extending the work in the Indian Ocean, carried out on the Carnegie in 1911, she made such cruises in the Pacific Ocean as were designed not only to cover large areas not magnetically surveyed, but also to determine, by intersection of her previous tracks, the changes ever going on in the earth's magnetism. Her ports of call included Dakar in French Senegal, Buenos Aires, St. Helena, Cape Town, Colombo, Perth, Fanning Island, Honolulu, Samoa and Colon.

On this journey one of the most interesting places visited was Gough Island, a lonely, uninhabited island of the South Atlantic. It is thought to be the home of the sooty albatross, several of which were caught and examined. Another interesting point is that concerning the so-called Royal Company islands. On October 12, 1920, the Carnegie was within one mile of their charted position, but nothing was sighted within a radius of 40 miles, though the visibility was good.

Inasmuch as these islands have been searched for unsuccessfully by several navigators and because of the likelihood of icebergs being mistaken for land, it is now recommended that they be eliminated from charts.

The first known record of magnetic-survey work relates to the cruises of the Paramour Pink, a ship under the command of the noted astronomer, Halley, for whom the comet was named. She set sail from England in 1698, the main purpose of the expedition being to find out, for the use of mariners, how the compass direction varies over the Atlantic Ocean. To carry to completion the task begun by Halley, but on a more systematic and comprehensive scale, there was designed and launched the Carnegie, that floating laboratory which combines the structure of vessels of the seventeenth century with the most modern scientific instruments of the twentieth—which, while reverting to the ancient in outward appearance, is engaged in the solution of a present-day problem of pronounced scientific and practical value.

The data obtained by those in charge are not retained selfishly for the benefit of any one people. Rather the Carnegie's work may be said to be international in scope. The observations made aboard her are intended to be, and are, supplementary to those of other nations.

But since no other country has such admirable facilities for the task, it is left to this American vessel to carry it on and to exhibit the information to the eyes of all peoples. For this reason the Carnegie may well be said to be a friendly link between nations, an instrument of good will and peace in an already war-cursed world, a fitting monument to her donor.

It is dangerous for a ship to deviate from its course, because it may strike a reef or some other submerged obstruction and wreck itself. The navigator follows the compass-chart, for this is supposed to be correct. He proceeds with his ship on the theory that he is in the proper travel lane. Thus it can be readily understood that if a ship is several degrees off the proper course it may be inviting trouble. Correcting the charts so that vessels of all nations can follow proper courses is only one of the valuable accomplishments of the Carnegie.

Mother Nature, the World's Greatest Sculptress

Her Marvelous and Colossal Works in Stone Inspire Awe

By CARL SCHURZ LOWDEN

SOMETIMES her sculpting tools are dull; then, of course, her work suffers. Sometimes she is merely lazy; the carven stone takes on an appearance of raggedness or slovenliness that does not betoken genius. Many of the faces she makes are outrageous, but some of them are really good. All in all the art of Mother Nature is a variable quantity; yet no other sculptress has done figures of such colossal size and done them so magnificently as has Mother Nature.

Her statue of Queen Victoria at East Weymouth, Massachusetts, should not be numbered among the best examples of her work. It looks somewhat like the "Man in the Moon," though Mother Nature probably caught her inspiration from the moon itself, which is feminine. It takes a gift of imagination to locate the face of the English queen; but it is there, at the side of the huge stone.

Up in the White Mountains of New Hampshire the coy old dame fashioned a stone cave man with a protruding forehead and a determined jaw plus a square chin. He is a striking figure that readily calls to mind "The Sphinx" or Hawthorne's "Great Stone Face." He is rough and rugged. The storms do not harm him. He serenely looks over the countryside, and the people affectionately refer to him as the "Old Man."

Farther north, in Maine, the sculptress made a profile of George Washington. It is near the falls of the Androscoggin at Lewiston. Evidently she is a flirtatious, impulsive lady; if she were otherwise, she would certainly have chosen a more appropriate site for her work of art, some rocky ledge that overlooks a battlefield on which "The Father of his Country" commanded the troops that fought for liberty. The profile is a good representation, though tilted backward at an angle of 45 degrees, with a factory forming a sort of frame on its right.

"Heap Big Nose" in Zion Canyon, Utah.

"The Old Man" in the White Mountains, New Hampshire.

If the tourist will now hop with me across the country "Westward Ho" to Utah, he will see in Zion Canyon a stony fellow with a monstrous nose and a fade-away chin. He does not seem to have much strength of character. This big boy has some qualities, however, that almost redeem his defects. He has a noble brow, looks courageously straight ahead, and has a real man-sized chest.

Out in the Socorro Mountains of New Mexico Mother Nature sculptured a head that is genuinely magnificent, but she failed to label it; and humanity has been striving to get the proper name. Some persons say a knight of the Middle Ages has been transplanted there; others vow the figure is that of a Spanish monk. This knight or monk, whichever it may be, has a four-squareness and a perfection about the cowled figure that permits it to be classified with the best works of art that the lady has produced.

"The Spanish Monk" in the Socorro Mountains, New Mexico.

But it is in the Garden of the Gods, near Colorado Springs, Colorado, that Mother Nature definitely established herself as the greatest sculptress. This section of 500 acres is remarkable for its many strange forms of rocks. Some of them bear a human likeness, others seem animals, all are grotesque and strangely unearthly.

"The road," says an unidentified author in describing this weird spot, "winds between every conceivable and inconceivable shape and size of rock from pebbles up to gigantic boulders, from queer little oddities looking like seals, cats or masks to colossal forms looking like elephants, like huge gargoyles, like monsters, like the sphinxes, some 80 feet high, all motionless and silent with a queer mien of having been just stopped and held back in the very climax of some supernatural catastrophe.

"The stillness, the absence of living things, the preponderance of bizarre shapes, the expression of arrested action, give the whole place a certain uncanniness of atmosphere which is at first offensive. I doubt if anybody ever loved the Garden of the Gods at first sight. One must feel his way to its beauty and rareness and must learn to appreciate it as one would a new language. Even if a man has known Nature's tongue well, he will be a helpless foreigner here."

Two of the figures, anchored together and seeming to be veritable brothers, share the name of "The Twins." They are ugly, ogre-like, uncouth, and their lips protrude as a demon's might. They could have stepped from the pages of Victor Hugo's "Hunchback of Notre Dame," or they could be the double reincarnation of Dicken's dwarf, Quilp.

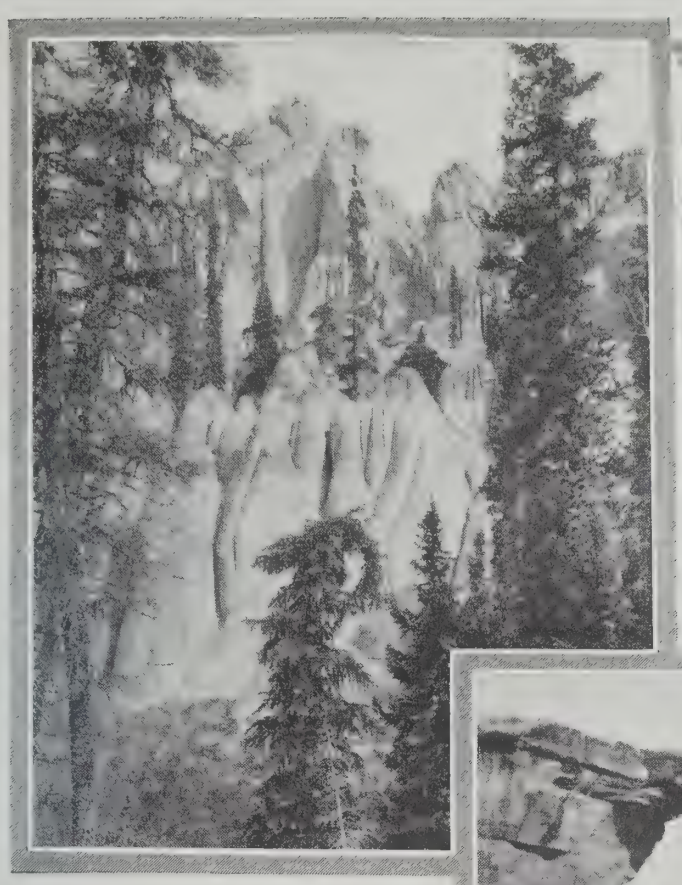
"Cathedral Spires" rise more than 200 feet. "The Tower of Babel" betters this figure by 50 per cent, is less pointed, but sufficiently fantastic to possess the name. "Balanced Rock," as large as an ordinary residence, reveals a roughly human profile. A piece of blood-red sandstone, "Major Domo," is 40 yards tall and 10 feet in diameter at the base; he has a rude knob as a head and displays a semi-ferocious grin, a reminder of that which Roosevelt made famous. At the top of one rocky mass Mother Nature has mounted a bear and a seal in an attitude of combativeness. Dotted throughout her studio are dozens of stone toadstools 10 or 12 feet in diameter and weighing as much as two tons each.

Mother Nature did not put all her animals in the Garden of the Gods. In Sylvan Lake, a sparkling gem of water in South Dakota's Black Hills, the tourist can see sprawled comfortably, toward the center, a huge rock turtle. In the vicinity of Lone Pine, California, there is a strange granite formation known as "Elephant Rock." Two big gray boulders, each about 15 feet high and approximately 25 feet long, seem to be two huge pachyderms, with lowered heads on the point of making a savage charge at the spectator. It is indeed a sight that thrills with its aspect of danger.

The Petrified Forest, south of Adamana, Arizona, contains a fantastic collection of agatized wood. One shape suggests a dog's or lion's head, and another strikingly resembles the neck and head of an ostrich. There is also a natural bridge, more than 100 feet long, which lies across a draw or canyon. Mother Nature, of course, did not do any carving to fashion this bridge; she merely felled the tree in the proper direction, waved her magic wand, and thus transformed it into stone that shall endure throughout the ages.

This bridge in the Petrified Forest is a sport or freak. With the exception of the widely-known bridge in Virginia, the real work of the artist lies in a compact group in Southeastern Utah. Some authorities declare that the Garden of the Gods pales into mediocrity when compared with the Utah wonderland.

"Sharp corners," says Professor Byron Cummings, of Utah University, in describing the "Kachina" bridge, more than 200 feet high, "and broken lines here and there in the arch and buttresses show the unfinished work of the artisan. Nature has not yet given the final touches; but wind and storm and driving sand will continue to chisel and polish until the lines are all graceful curves, adding greater beauty to the most massive of the bridges."

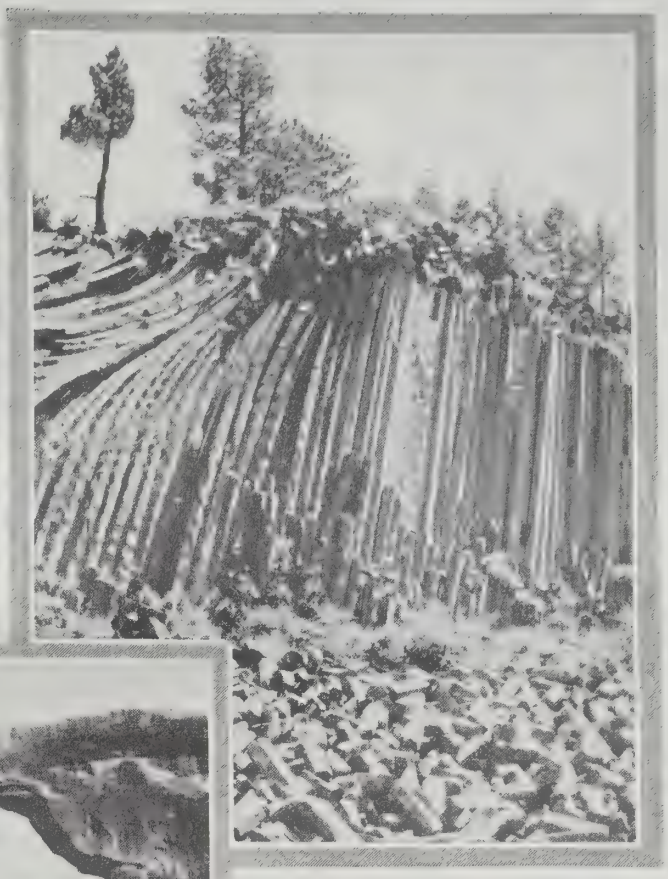


The "Kachina" or "Caroline" easily towers over the "Little" or "Owachomo," which is only six miles distant. The elevation of the "Owachomo" (its Indian name) is slightly more than 100 feet, while the graceful structure has a span of slightly less than this number doubled. The long arch of sandstone pleases the eye and seems light because its thickness in the center does not exceed a scant 10 feet. This bridge is very possibly the most picturesque of the three. Closely adjoining it are many domes and turrets fashioned by the same marvelous power that produced it from the rock. A cave nestles on the sunny side of a cliff at one end of the bridge, and within this cavern are the deserted homes of cliff dwellers.

But the mightiest of the bridge trio is the "Shipapu," or "Augusta," which extends skyward 222 feet, with a space of 261 feet between the abutments, a stone arch 65 feet thick, and a roadway more than nine yards in width. It has a queenliness and a majesty all its own, a certain something that puts it apart as one of Mother Nature's genuine masterpieces of sculpture. In a satisfying way she has here combined gracefulness and massiveness at the expense of neither.

The largest natural bridge known, however, is the "Rainbow," discovered in August, 1909, and in May of the succeeding year set aside by presidential proclamation as "Rainbow Bridge National Monument." Its Indian name is "Nonnezoshie," and it qualifies better as an arch than as a bridge. With an arch 308 feet in height and 274 feet in length, its proportions strike the visitor as truly splendid and awesome. Mother Nature has put other bridges in Utah, also in the Yellowstone country, in the Mesa Verde National Park of Colorado, and elsewhere; but the four described here excel all their mates in size and grandeur.

Apparently there is nothing that the sculptress will not attempt to fashion. One would think that ghosts would be a subject to be shied at. No, Mother Nature has even tried her hand in making them live in stone, and authorities agree that she has achieved a marked success. If you will go to the Wheeler National Monument in the Rio Grande National Forest of Colorado, you will see many spectral figures apparently wound in sheets and seeming to be gigantic, white-clad members of the Ku Klux Klan.



Did you ever see the "Devil's Post Pile" in the Sierra National Forest of California? Mother Nature must have sculped brilliantly for many weeks. Was the devil planning a fence for the nether region? Did he stand by and wait while the old lady patiently carved them out of the rock? Then he probably inspected the posts and flung to the ground those that he deemed imperfect; this theory would explain the litter of fragments in the foreground of the picture on the other page.

"The Ghosts," in Wheeler National Monument, Colorado.

What a Settler Finds When He Goes to Alaska

Physical Strength and Honesty Prime Requisites in the North

By THOMAS B. DRAYTON

EVERY Alaskan knows what a settler would find here, and every Alaskan would be glad to tell—up to a certain point. When the agreeable things have been told; such as our unequaled scenic wonders, whose glories dim the splendors of the New Jerusalem; and our fishing and hunting, the equal of which old Nimrod himself never knew; and our freedom from empty conventions and artificial distinctions and shams that cheapen men and do women no good; when these agreeable things have been told about Alaska, then arises that old bugbear of writers and politicians—a decision betwixt love and duty. But as this is an assignment to write what a settler finds in Alaska, and not what a loyal Alaskan would like to be able to say a settler finds in Alaska, it will be necessary to eliminate the love feature entirely and present facts precisely as they would be found by a newcomer on his arrival. He would already have found that it costs an amazing jag of money to get here, especially if he have a family of any size, and that the estimates made in advance by the transportation people prove them to be conservatives after Judge Elbert Gary's own heart.

Alaska is no proper place for weaklings. In at least one respect they are like transplanted tropical flowers—they never do well, even when carefully tended; and they can rely on careful, or rather excessive, attention in Alaska if they have a reasonable bank roll on arrival.

Sickness is rare among seasoned Alaskans, and almost rare among any type of people anywhere in Alaska. When an old-timer gets sick they begin to discuss the funeral arrangements, and would be considerably disappointed should the tentative arrangements turn out to have been premature.

Any man outside of the weakling class can get along in Alaska, provided he is reasonably honest. If his character be all shot to pieces so he cannot resist the temptation to do crooked things, he had better stay away; and this is particularly true of persons given to stealing, killing, forging, and such like serious matters. These real crimes Alaskans do not tolerate. True, some person, generally a stranger, loses his head occasionally and perpetrates a felony; but capture and punishment are so certain that no sane criminal—if there is such a thing—would ever take the risks involved.

Even in the more settled communities the presence of a stranger is instantly noted, and the comings and goings of residents are so well known to everybody else, that any variation from usual custom, or any suspicious circumstance, would have to be satisfactorily explained. The only practical way to get out of Alaska is by boat, and no possible criminal could procure passage. Should an offender make for the hills or escape to the brush, he would soon be faced by the alternative of starvation or surrender. Men can, and many do, live on the country largely, but no man's rifle will supply him with food permanently unless he have ammunition; and permanent shelter against Alaskan weather is impossible without an axe and other necessary tools.

Besides, there are many men living back in the sticks who have the curiosity of a panther on noticing a strange track, and almost a panther's skill in following such a track. These men would all know of the crime's commission, and would be on the lookout for the perpetrator. Singularly they are the most voracious readers and news swappers imaginable. Nothing escapes them from trivial local happenings to diplomatic matters of international importance. And they have an abundance of time to devote to such odd jobs as, aside from a little trapping to supply themselves with money for tobacco, ammunition, printed matter, and other indispensables, they never by any chance do a lick of regular work. From all of which circumstances it will appear to the proposed settler that he will find his Alaskan neighbors to be as honest and law-abiding a lot as could be found anywhere on earth. Unless he were a particularly discriminating individual he would come to a different conclusion during his early sojourn, as the first man he might meet would dwell at length and in detail upon the rascality of his neighbors and their general worthlessness as citizens. This informant would be described in identically the same way by the next neighbor and so on throughout the community. In time the settler himself would acquire the same habit of villifying his neighbors, but would never dream of refusing them a favor or of lending any of them money, and would never doubt for a second that it would be promptly repaid when due; although he himself, and everybody else in the neighborhood, except the borrower, would pretend to believe the loan irretrievably lost.

The Alaskan of long standing is not only a great fault-finder, but is pugnacious and contentious to the *nth* degree. It was this identical circumstance that resulted in the appointment of a carpet-bagger, Scott C. Bone, as governor. President Harding had expressly agreed to appoint any Alaskan the Alaskans themselves would agree on. Although any loyal Alaskan would prefer a local Mephisto as governor rather than the greatest and most engaging carpet-bagger extant, yet everybody knew the jig was up when the President imposed that condition of the Alaskans' agreement. We never agree.

This spirit of contrariness on the part of the men is fully equaled by the tendency to vindictive gossip among the weaker vessels; to employ a humorous metaphor to illumine a serious subject. We have many noble exceptions presumably, but the rule will hold good. Every Alaskan woman knows just what every neighbor had for dinner today; the price to a cent paid for the new hat, and how utterly horrid it is; the exact trouble with the new baby across the way, and how stupid the mother is; and the indiscretion of the parents down the street in permitting the attentions of the young man who is sparking their daughter, and how the nice things said of him by his employer is pure bunk; and all other intimate details of our several Alaskan lives. Then, too, in addition to the isolation and seclusion of their lives, our women come from many social strata. Our society is much mixed. There are great numbers of women who were once inmates of dance halls of a decade or so ago, now married and leading exemplary lives. Singularly, these women are more remorseless in the pursuit and more pitiless in the crucifixion of women who have erred, or whom they hope or suspect or insinuate have erred, than any other members of our population. We have a way of taming the man who poisons social currents but the person protected by a skirt is beyond our power.

Men of particular classes are much alike in character and habits after a few years of Alaskan life. The recluse back in the sticks is about the same man wherever found; the professional trappers come to look and live and dispute very much the same. Alaskan miners are almost invariably of the same hopeful, adventurous, take-a-chance type; while it is perhaps superfluous to say that fishermen show but little variation from type.

The chief amusements in Alaska are hunting and fishing. Dancing is much in vogue in the larger settlements, and card playing, particularly bridge, is everywhere in evidence. Skating and ice sports are confined to children almost exclusively, excepting in two or three settlements. Sleighing is almost unknown, due to the absence of suitable roads. Dog-team races are quite common all over the territory; one or two annual events having become famous. The Nome-Candle annual race is an especially important event, and perhaps more money changes hands on the issue of this race than even on that other famous annual event, the break-up of the ice on the Yukon in the spring.

If there is any illiteracy in Alaska it has escaped notice. Indeed, it is probable that the average of intelligence is rather higher than in any other community under American jurisdiction, except alone the most highly favored educational centers. The percentage of educated men is certainly surprising to strangers. Scarcely a great school in the world but has its graduates here habited in the rough dress of the pioneer; and Yale, Princeton, Harvard, Columbia and other distinguished schools, particularly in California and Washington, are represented by a considerable number in the aggregate.

Climatic conditions are quite different from what the average settler expects to find. The coastal region of Alaska for 2,000 miles is mild, due to the influence of the Japanese current. In the interior, and north of the Endicott Mountains, the winters are long and severe, although the extreme temperature of 60 to 80 below (Fahrenheit) are exceptional. They are fine to give color to the hardships of explorers and other adventurers, who all stay indoors at such times, but otherwise are mostly of the character of children's tales of goblins and bogy-men.

The mean temperature of Point Barrow, 300 miles inside the Arctic Circle, for the coldest winter month has stood at 21 below zero since the weather reports were first recorded at that station. This is the extreme northern tip of Alaska on the Arctic Ocean. It is true that Fort Yukon has shown a mean (on a badly broken record) of 10 degrees colder; but no other point in Alaska has been so cold. Different sections of the interior are greatly affected by mountain ranges, and vary greatly in temperature both winter and summer. It would be just as difficult to give a definition of Alaska weather applicable to all parts of the territory as to give a definition of climate applicable to both Italy and Sweden.

The great Tanana valley, the famed "agricultural" region of the Fairbanks district, never thaws out below three feet from the surface. On the other hand the equally great Susitna valley was unfrozen to a depth of eight feet last July. This was proved by various excavations. It probably never freezes very deep. Moreover, the Susitna valley is soil on top, not moss.

Topographically, the lower or southern part of Alaska, rather more than a third part, is mountainous, with a number of valleys and many glaciers. It produces much timber, some of it merchantable outside, and practically all suitable for rough lumber. The western and northern part of Alaska is largely a treeless tundra, except near the waters. The remainder of the territory may be designated roughly as the Yukon country, and the island districts. The Yukon division largely rises to the altitude of hills and low mountains, but is otherwise a tundra country, except in unimportant spots. This tundra region is expected to be the home of an immense reindeer industry of the future.

The Aleutian archipelago consists of about 75 islands of map-size, and innumerable smaller islands in various groups. The islands extend so far west that the tip is within the eastern hemisphere to the extent that the setting sun in summer in that section of Alaska is viewed as the rising sun on the New England coast. These Aleutians are barren, treeless, and mostly uninhabited. The whole southern coast of Alaska, as it extends westerly, is dotted with islands of various size, the largest being Kodiak.

All the towns have public schools, perhaps equal in all important respects to the public schools in the States. It is an interesting fact that Alaskan children removed to outside schools almost invariably pass into a higher grade, and almost invariably head their classes in whatever grade they find themselves placed.

The settler would find the chief industry to be fishing. This industry has produced a business of nearly $475,000,000 since the succession of American jurisdiction in 1867. It is practically monopolized by non-resident corporations.

The next industry of importance is mining, with an output to date of more than $460,000,000, nearly three-fourths of which was gold, and the remainder chiefly copper.

The fur trade comes next, with a recorded total of more than $90,000,000.

Agriculture, to which the proposed settler would presumably devote himself, is yet in the experimental stage. Only a fool or knave would advise any man to sell out in the States and come to Alaska to farm before looking into the situation thoroughly. And the official report issued by the government's agricultural department must not be given too much weight. Doubtless it is absolutely and exactly true in all its statements, but it does not state enough. Wheat, for example, can be grown in Alaska, but there is no man who has tried it but will admit it cost him at least three times as much to produce a bushel as he could get for it in the market—even as a curiosity.

Oats, rye and barley mature under favorable conditions, and the world cannot beat Alaskan potatoes, strawberries, radishes and celery, and no place on this planet can begin to equal our Alaskan rhubarb. But this brief sketch includes the story of what a settler may find if he will use his native mother wit in connection with what he has read.

(C) Gilliams Service

Harpooning polar bears is a popular sport of Eskimos dwelling on the coast of Alaska. When summer comes and the frozen waters are broken up into floating ice cakes, the polar bear is unable to get about in his accustomed manner, but being a good swimmer he takes to the water to go from place to place. Eskimo hunters then go after him in any and all kinds of crafts. Being expert with the harpoon, they use this instrument of capture because the rope attached to it prevents the animal from sinking beneath the surface, as he would do if shot. The sport is said to be full of excitement, as the polar bear is a fierce fighter when aroused.

Charles M. Sheldon, Author, Preacher, Editor

By FRANK M. CHASE

TO KNOW the life and work of Charles M. Sheldon, and especially the man himself, is to receive new inspiration and enlarged faith in humankind. His achievements, as an author, a clergyman and an editor, are distinguished. One of his books, "In His Steps," alone has reached a sale of 22,000,000 copies—certainly a high mark for the aspiring writer. Refreshing, too, is the fact that a book of its deeply religious nature should have found enough readers to make possible so phenomenal a sale.

This book, which doubtless has contributed most to Dr. Sheldon's fame, has been translated into many foreign languages. He himself knows of its production in 14 tongues, while one reputable reference gives the number of languages in which it has appeared as 24, and its publishers as more than 100. As the book's copyright proved defective, he has been unable to keep even an approximate record of the number of its editions and translations. Likewise, he has had little pecuniary benefit from it, his only royalties being from one early edition. In addition, on meeting an English publisher in London about 20 years ago, who had then sold 2,000,000 copies of the book and who wished to show his appreciation in some way, he was presented with a gift of 20 pounds.

But the distinctive accomplishments of Charles Monroe Sheldon have been built into a life directed along original lines from early manhood. He was born at Wellsville, New York, February 26, 1857, the son of a Congregational minister. Owing to the widely separated charges which his father held in the next few years, his boyhood was spent successively in New York, Rhode Island, Michigan and South Dakota. In the last-named state he lived near Yankton, on a homestead which the Sheldon family obtained from the government and "proved up."

In 1879, as a husky 22-year-old, fresh from his homesteading experience, he entered Brown University. Here, for two years, he enjoyed an intimate friendship and association with Charles E. Hughes, the present Secretary of State, graduating in 1881. While both were in the university they were members of the same society, translated their Greek and Latin together and inhabited each other's rooms with the usual college familiarity.

After completing his course at Brown, in 1883, Sheldon entered Andover Theological Seminary, from which he graduated three years later. Throughout his seminary course he wrote for the *Youth's Companion,* and with such success that on his graduation Dr. Lyman Abbott offered him a department in the *Outlook* to develop as he chose. But Sheldon wanted to preach. In fact, he had two very definite ideas as to what he wished to do: he wanted not only to preach, but to become the minister of a new church, which he could develop in accord with his own ideas. He, therefore, refused the editorial offer. There seemed to be no immediate opening for him, however, so he decided to continue his social studies in London for a few months. To do so he borrowed $200 and made the trip to England as a steerage passenger.

Preached "In His Steps" as Sermons

ON HIS return he accepted a pastorate at Waterbury, Vermont. This church was composed almost wholly of adults while Sheldon was by nature and inclination better fitted to work with young people, and his opportunity was limited. In the second year of this pastorate, he was informed of the organization of the Central Congregational Church, of Topeka, Kansas, which, on learning of his special desire to ally himself with a new church, issued him a call. This he accepted, beginning his duties in the pulpit, where he was to receive world renown, the first of the year, 1889.

The formation of this church marked the breaking away of a portion of the membership of a large downtown church, and the little congregation met in the room over a desolate store at the edge of the city. Despite the best efforts of the minister, progress was slow. He realized that his hopes for building a strong church lay chiefly in making it interesting to young people, and in his efforts to do so he at last hit on the plan of preaching his evening sermons in continued-story form. This plan accomplished its purpose, and was continued more or less regularly throughout his pastorate. Incidentally, it gave rise to more than a score of books, several of which, as "In His Steps," have been widely circulated.

Dr. Sheldon read "In His Steps" in installments to his congregation during the winter and spring of 1896. A few months later the Chicago *Advance,* a religious paper, began its publication as a serial. Immediately a great demand for it in book form arose, and the author, when the matter was brought to his attention by the paper, stated his desire that at least one low-priced edition be printed, so that no one might be deprived of the book because of its cost.

His desire was to be gratified, as we shall see. Publication of the books by the Advance Company began in the fall of 1896, and for three years its sale averaged more than 1,000 copies for every working day. Presently its publication was begun in England, one of the first things the American publishers heard about it from abroad being that a Catholic priest in Ireland was reading the book to his congregation. A London publisher produced one and four-pence editions extensively, thousands of these copies being sold on the streets of that city by newsboys. By 1900, it was estimated, the sale of "In His Steps" in England alone had reached 3,000,000 copies; while in this country, besides its circulation by more than 50 publishers, the American Press Association ran it through scores of daily and weekly papers.

Two other books by Doctor Sheldon, "Robert Hardy's Seven Days" and "The Crucifixion of Philip Strong," also were not protected by copyright, though neither has approximated the sale of "In His Steps." His latest book, "In His Steps Today," was published in 1921, and is finding many readers. While the title suggests it, this is not a sequel to the earlier work. It presents, however, the same uncompromising obedience to the precepts of the Gospel in everyday life, by asking "What would Jesus do?" in the position of the laborer, the farmer, merchant, clergyman and others in solving today's political, economic and social problems.

Readers of "In His Steps" will recall that a considerable part of the action centers about a newspaper, whose editor endeavored to conduct it in a thoroughly Christian manner. This feature of the book naturally evoked much comment within a short time after its appearance. Interest in the matter was renewed in the summer of 1899 when, at a national Christian Endeavor convention in Detroit, Dr. Sheldon asked this question: "In this day, when philanthropy munificently endows our institutions of learning, is there a man who, recognizing the potency of the public press to make or mar our civilization, will contribute a million dollars to establish a daily Christian newspaper?"

When He Ran a Newspaper

AGAIN the "Sheldon idea" was widely discussed, the upshot of the matter this time being an offer of the editorship, management and absolute control of the Topeka *Daily Capital* for one week to demonstrate his conception of a Christian daily newspaper. No restrictions whatever were placed on his authority except, as the letter making the offer stated, "such as your own good sense will suggest as necessary for the future protection of a valuable property." This offer was made and accepted near the first of the year, 1900, and it was agreed that Dr. Sheldon should take charge of the paper on Monday, March 13, of that year.

The announcement of the Sheldon editorship was made in January. Quite naturally the coming event was widely heralded, and interest in it grew apace. New York, Boston and Chicago newspapers sent correspondents to Topeka, while some of the New York papers printed Sheldon supplements in their Sunday editions. Sir George Newnes, publisher of the *Westminster Gazette* and the *Strand Magazine,* arranged to put out an English edition of the *Capital* under Sheldon. In all, as "Sheldon week" opened at Topeka, about 20 special press representatives were on hand to report each day's developments.

Meanwhile orders for the *Capital* poured in from every quarter. For nearly a week preceding March 13, subscriptions arrived at the rate of 25,000 a day. They came from every state and territory of the nation, and from 27 foreign countries as well.

From a subscription list of 12,000, the circulation of the *Capital* shot up, for the week of Sheldon's editorship, to 364,000 daily. Inasmuch as the paper possessed only a small press, which had never printed more than 15,000 copies in one day, it was impossible to produce the suddenly augmented edition with the facilities at hand. Accordingly, matrices of each page were made and shipped to other cities, parts of the editions thus being printed in Kansas City, New York, Boston and Chicago; while at Topeka the foreman of the press room stood over his one machine day and night, and, with his heart in his mouth, coaxed it into turning off 100,000 copies each 24 hours.

How He Helped Famine-Stricken India

DR. SHELDON has long held the view that, in so far as possible, the front page position of a newspaper should be devoted to news of world importance; and, on the first day of his control of the *Capital,* announced that his policy would be followed. But a scarcity of such news arose to hinder the plan. The Boer fighting had just ended, and there was a lull in international developments. Neither was there much news of national importance. It was simply one of those weeks—now a rarity indeed—of "no news." However, 50,000,000 persons were suffering from a great famine in India. To this the dailies of this country had given no attention, but Sheldon used a story about it in the first column of the front page of the first issue under his direction. Accompanying the article was an appeal for funds to help the sufferers, each reader being asked to contribute 10 cents. This appeal was taken up immediately by numerous agencies, and as a result a relief fund totaling $100,000 was raised and, in addition, a trainload of Kansas corn was sent to the famine-stricken regions.

"The main purpose of the paper," Sheldon said in announcing his policies, "will be to influence its readers to seek first the Kingdom of God." In politics the paper took a non-partisan position, and stood for prohibition by whatever means. Prominence was given to social questions generally. Patent medicine, liquor and all questionable advertising was refused, while that accepted was massed in the back of the paper. No special or undue attention was given church matters, the predominant characteristic of the paper being its social interest. There was no Sunday edition. Instead an extra edition, "suitable for Sunday reading," was printed and distributed before midnight Saturday.

DR. CHARLES M. SHELDON

Scandals and sensations, of course, were taboo. Illustrating Dr. Sheldon's policy toward them was his action when the son of a prominent Topekan killed himself in Kansas City. On receiving the news late in the evening one or two of the reporters desired to feature the news and to interview the boy's family for this purpose. But Sheldon advised them that the rules of the paper held in this case, as in others. "That boy's folks are in trouble," he said, "and we would better keep away from them. Instead of interviewing them we will send them a note of sympathy." This was done, the paper printing the next morning but a very brief account of the young man's death.

Though the members of the *Capital* staff gave Dr. Sheldon's policies and management their most cordial and earnest support, they were not men of his own choosing. Neither was one week long enough to demonstrate the ultimate result of his policies. As was quite to be expected, the newspaper comment that followed his editorship—and there was an immense amount of it—generally appraised the demonstration a failure as a newspaper. Dr. Sheldon, however, has never felt remorseful over his week's work as a daily newspaper editor, believing that the relief brought to India alone justified the effort. In view of later journalistic practices, too, especially with reference to clean advertising, his work was prophetic of valuable reforms.

Prominent in Prohibition Movement

IT IS interesting, in looking back over the subjects to which Dr. Sheldon gave special attention, to note those which we are still discussing and those on which we have taken advanced ground. There were articles on the rise of socialism in America, on woman's suffrage, prison reform, banishment of war and—of course—prohibition.

In the prohibition fight he has taken a big part, not only in Kansas, but nationally and internationally. The Kansas battle won, he became one of the speakers in the famous "Flying Squadron" which toured the United States in the interests of prohibition in 1914 and 1915. This organization of 18 men, raising funds for its work as it went, held two meetings on each of three successive days in 247 towns, completing the entire trip in 243 days and without once missing a train or interrupting the schedule.

He also participated as a speaker in an anti-liquor campaign in New Zealand and Australia at the beginning of the war, and in a similar crusade in London about three years later.

In the announcement of his policies in the *Capital* back in 1900, he declared his abhorrence of war, "as it is being waged today not only in Africa but in the Philippines and everywhere else," and, though his son was in the Great War, he has been a leader of anti-bellum sentiment ever since. Through the *Christian Herald,* of which he is now editor, he obtained the signatures of nearly 4,000,000 Protestant church members in the United States to a peace resolution, which he and the publisher of the paper personally presented to President Harding just before the armament conference opened. Dr. Sheldon remained in Washington 10 days, attending the first sessions of the conference and interviewing the foreign representatives, and is now using the material so obtained in a vigorous editorial campaign for disarmament.

At the time of the "Flying Squadron" tour, Dr. Sheldon was having a three-year respite from active church duty, being minister-at-large for this period. In 1915, he resumed the pastorship of the Central Congregational Church, continuing in this capacity until 1919. Under his leadership the church prospered greatly. The little congregation that once met in a store numbered, before his resignation, about 1,000 members and met in a beautiful and adequate edifice.

In January, 1920, he became editor of the *Christian Herald.* Though this paper is published in New York, he has continued to live in Topeka, directing the editorial program from the little one-room study back of his home, where a number of his books have been written.

In Business, Where Does Honesty Lie?

Various Schemes Utilized to Increase Trade and Profit; How Federal Trade Commission Is Forcing Square Dealing

By WILLIAM ATHERTON DU PUY

THERE is an adage in the commercial intercourse of the race, *caveat emptor,* which lays down the rule, "let the buyer beware." Under that rule the vendor justifies himself in selling poor goods at the price of first-class, any goods at the highest price obtainable, instead of at a fair profit. The buyer, however he may trust to the seller's bona fides, must look out for himself. The seller has no responsibility.

On the other hand, is the principle of *uberrima fides,* which is one step beyond bona fides, *uberrima fides* meaning the utmost of good faith, the theory that the seller should reveal all he knows about a commodity to the purchaser. He may do so on the theory that honesty is the best policy or he may do so from principle. At any rate, he gives the buyer the truth about his goods.

The conflict of these two theories of business is as old as the ages. In the chronicles of the time of Cicero there is an excellent example of the question being raised. There was famine in Cyprus and a merchant of Athens set out for that port with a shipload of wheat. On the way over he passed a fleet of ships likewise loaded with wheat and bound for Cyprus. But his vessel was swifter than the rest. He reached the port a day ahead of them. He pressed a hard bargain and got a fancy price for his wheat. Yet he knew that on the next day the harbor would be full of wheat-laden vessels and the bottom would drop out of the wheat market. Had he a right to suppress his information and reap all the profit he could?

Merchant Must Tell the Truth

CICERO wondered. He appointed one young lawyer to argue in defense of the action of the merchant and another to support the opposite contention. Each defended his position gallantly, but the issue was not settled. It has been fought over from that day to this.

But recently out of this contention of the centuries has evolved something tending to settle the argument as to where honesty lies, to establish a gauge with which to measure commercial conduct, to point the finger of condemnation at him who is unfair.

Here in America in the third decade of the twentieth century there has come into existence a governmental agency which officially is emphasizing the obligation of truthfulness in trade. The Federal Trade Commission, a non-political agency, attached to no department, built about five commissioners who do not change with administrations, sits in judgment on the practices of men and corporations. Its findings are based on a declaration in the law which created it to the effect that "unfair competition is unlawful." It is authorized to pass on what constitutes "unfair" competition. A survey of its cases shows that the commission puts emphasis on representation. A merchant, if he represents his goods at all to a buyer, must represent them truthfully. And here is an example of the commission's work:

There is the case of a certain kind of rope which is sold throughout the country in hardware stores. The rope was likely to be made of sisal and sold for "hardware manila."

"Hardware manila" did not necessarily contain manila (a superior rope material), or it may have contained so small a percentage of manila that the use of the word "manila" was not warranted in describing it. The Federal Trade Commission ruled that it was unfair to use the word "manila" to describe what was in fact largely sisal. It persuaded those who were using the word "manila" on sisal rope, to brand correctly the rope by marking the burlap in which the coiled rope is sold. If it were sisal rope it could not be called "manila." If it were mixed sisal and manila, and the word "manila" were used, the percentage of manila fiber contained in the rope must be indicated. Similarly where rope makers were recovering manila fiber from old rope, rewinding it and calling it new manila rope, the commission issued an order commanding the manufacturers to stop branding it as new manila. The rope trade generally welcomed the order. So an official standard of truthfulness was set up.

Old Goods Cannot Be Sold as New

HERE and there at different points in the country it has come to pass that individuals or companies have engaged in rebuilding old automobile tires, have retreaded them and have afterward sold them as new tires. They were not, as a matter of fact, new tires, the casings were likely to break and there was not the service in them that there was in new tires. Selling them as new tires was a misrepresentation, constituted unfair competition, was contrary to the public interest, and, in the eyes of the law which created the Federal Trade Commission, was unlawful. Various persons engaged in working over old tires and selling them in this way have been ordered to "cease and desist."

Other agencies also have engaged in the rebuilding of typewriters. An old typewriter may have certain of its parts replaced, may be repainted and refurbished and sold to the inexpert as a new typewriter. Under the old doctrine of *caveat emptor* such practices would be permissible. The Federal Trade Commission holds that today it is unfair and unlawful. The seller must not represent a rebuilt typewriter to be "new."

One outstanding case thoroughly investigated by the commission was that of the preparation of sponges for market. Sponges, in bulk, on the market, are sold by weight. Some dealers in the sponge trade resorted to devices that would increase the weight of their product. They found that by passing their sponges through a bath of glucose and sand they would retain certain unnoticeable amounts of those materials which would increase the weight and make them correspondingly more profitable. This practice made it difficult for the people in the sponge business who did not "load" to compete with those who "loaded" their sponges. The practice of selling "loaded" sponges for pure sponges was called to the attention of the Federal Trade Commission, and it issued an order against the practice.

So-called "Japan linen" is a quality of paper which is made in Japan and has gained a certain position in the trade. Because of its popularity, American and English manufacturers began to put on the market a paper which they called "Japan linen." This fact was called to the attention of the Federal Trade Commission, and the American paper manufacturers agreed not to use the brand "Japan linen" unless it also was stated on the product that it was "Made in America."

A much more important case was that brought to the attention of the commission by the silk trade. It was asserted that certain manufacturers of mercerized cotton goods represented and sold their product on the market as silk. As a matter of fact, it was not silk at all. The Federal Trade Commission forbade these manufacturers from so misbranding it.

An interesting case was that of finger rings manufactured and sold by jewelers. Most such rings are composed of a gold shell which is fitted over a core of some inexpensive metal like steel or brass. When a ring is offered for sale it is marked "G. S. 14 K." the "G. S." indicating that it is gold shell and the 14-carat indicating the degree of purity of the gold that has been used in the shell of the ring. It does not, however, indicate the thickness of that shell nor the proportion of the ring as a whole which is gold. Now, as a matter of fact, in rings marketed, many of them were one-tenth gold and many of them one-fifteenth gold. The individual who sold a 14-carat gold shell ring which was one-fifteenth gold obviously had an advantage in competition over the individual who sold a 14-carat gold shell ring one-tenth gold. The dealers appealed to the Federal Trade Commission and the commission ruled that rings, if branded at all, should not only be marked as to the degree of purity of the gold in them, but as to the percentage of it. It required, for example, that rings should be marked, "G. S. 14 K. 1/10," or "G. S. 14 K. 1/15" as the case might be. Thus was a step taken toward properly informing the public as to the rings which it wore, giving it the facts about the thing it bought.

Trading on Well-Known Names Unlawful

THERE was an Electric Appliance Company in Chicago with an established clientele. In another city there was an Electric Appliance Company, which manufactured electric belts, such as are sold by patent medicine men at street fairs. These latter belts carried the name of the Electric Appliance Company as their maker, but not the address. When they failed to measure up to the claims for them, complaint was quite regularly made to the larger organization in Chicago. The Federal Trade Commission ruled that the result was unfair and that the belts must either not carry the name or must also carry the address of the manufacturer.

The Goodwear Rubber Company entered the field, manufactured various rubber products, and the Goodyear Tire & Rubber Company protested against the use of Goodwear, calling attention to the fact that it differed from its own name only in one letter and that it deceived the public and traded on its standing, a contention which the Federal Trade Commission sustained. Mentholatum was an established product on the market and a competitor appeared with the name of mentholanum, which the commission considered simulation of name and ordered it stopped.

A different sort of alleged unfair competition was practiced by a certain large manufacturer of patterns for women's dresses who, in his contract with a given retailer for handling those patterns, wrote a clause which said that no other patterns should be handled. This contract is what has been called a tying contract and tying contracts have been declared by Congress to be illegal, and the commission sought to determine whether the manufacturer had violated the law. The manufacturers appealed to the courts to stop the commission's inquiry and the matter is still in the courts. Another example of the tying contract was that of a very extensive manufacturer of railway lubricants who wrote an inclusive clause into his contracts, which clause has been interpreted by the commission as contrary to law.

A very important practice affecting many householders in the nation is a practice which has appeared among a certain few creameries of the United States as to the weight of the packages of butter they sell. Under this practice, when a housewife went to the market and asked for butter, she was given a package which looked like a pound but was really not a pound. This package was wrapped in a paper either not marked with its true weight at all, or containing a good deal of printed matter and on which it was stated, somewhat obscurely, that the weight of this package was 15 ounces.

In case the 15-ounce packages were not marked with the weight at all, the purchaser presumably believed it was a pound. In case it was marked "15 ounces," the purchaser was liable to overlook the mark. Several complaints have come to the commission on this matter. The commission is considering the whole matter and has as yet made no decision. The great majority of creamery men oppose the practice.

One of the most important unfair practices with which the Federal Trade Commission has to deal is that of commercial bribery. If, for example, a ship came into any of the great seaports of the nation and wanted to take on supplies for a voyage, an officer went to some ship chandler to buy, the practice had grown up among ship chandlers allowing the purchasing officer of this ship a personal rebate on all he bought. Where one ship chandler allowed this rebate and another did not, the first was sure to get the business. Thus he forced the other ship chandlers to resort to the same practice of rebating, or commercial bribery. The ship chandlers themselves asked the Federal Trade Commission if it could not break up this practice. The commission has issued many orders forbidding the practice, and it is disappearing.

Commercial Bribery Branded Unfair

THE ink trade was another industry which was much harassed by the practice of commercial bribery. The foreman of a printing shop was pretty well able to control the ink orders of that shop and by bribing him the ink salesman held his trade. The manufacturer who did not subsidize the foreman was likely to lose the business. Competition forced him to it. Commercial bribery ran all through the ink business, was a heavy burden to it, a ghost which rose to plague it. The Federal Trade Commission ruled this commercial bribery to be unfair competition and ordered its discontinuance. Similar practices in the chemical, varnish, soap and other industries, were ordered stopped.

In this way the Federal Trade Commission has been reaching out in the six years of its existence into one line of business after another and removing this element and that which it regarded as unfair. It has been setting up actual standards of business truthfulness. It has provided an agency to which any individual or any industry may appeal when confronted with competing practices that seem to it unfair. It has established a court of business practice which is easily accessible, which is without the technicalities of other courts, and which assesses no penalty other than that of declaring a practice unfair, and, after full trial, ordering the man at fault to quit. It has provided a thing for which honest business has fought through the ages but which it has never before so definitely found.

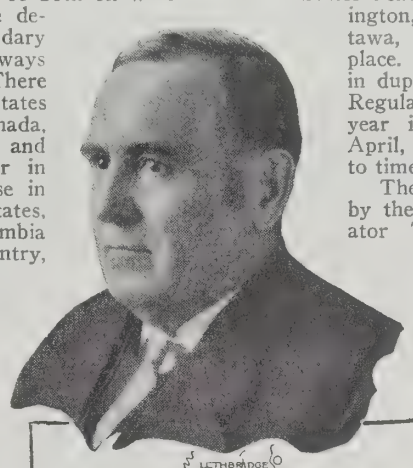
Now, in these circumstances, you may ask, what is there that the individual citizen may do to aid the drift toward greater frankness and better conduct in the commercial life of his community? The answer is that there are a number of very definite things he may do.

Up to the Public to Expose Untruths

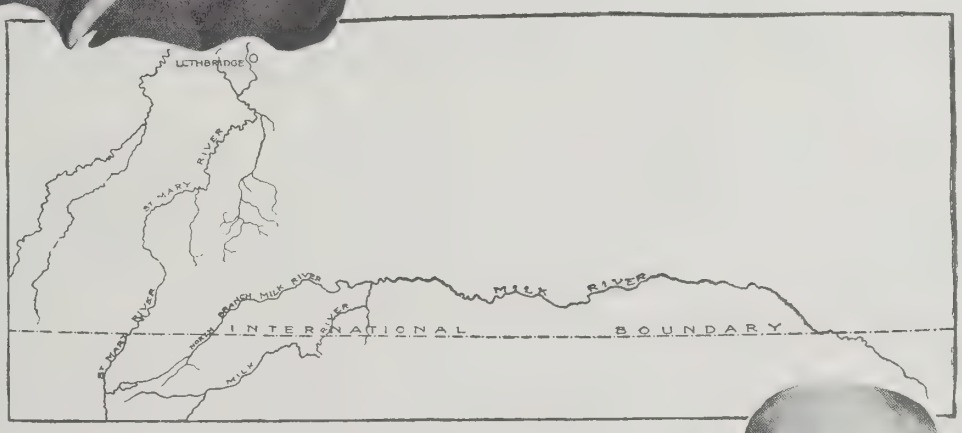
NO MATTER who you are nor where you are, you probably are aware of one practice or another on the part of your grocer or dry goods merchant, hardware merchant or butcher, which you may believe deceptive and unfair. Perhaps you have a personal friend who has acquired some of these vices of business. What you ought to do right now is to go to that merchant or that friend and say to him that this practice is deceptive, that what he is doing is not in accordance with the standards set up by the Federal Trade Commission and that he should get away from the practices of the past and adjust himself to the changing times. You should warn him that if he does not, this governmental agency, whose business it is to look into just such practices, may swoop down on him at any moment and may finally issue a complaint against him challenging his act as unfair, which, in the face of the competition he must meet, would cause him great mental anguish.

It may be that you know of individuals or corporations that are more flagrantly violating the principles of honest business. It may be that you are in business and suffering because of unfair practices of your competitor. Under these circumstances you should remember that you have a place to which to complain, established for that purpose by your government. You may write a letter, addressing it to the Federal Trade Commission, Washington, D. C., and set forth your complaint. If the basis for it seems sound the commission will send an examiner to investigate. If the investigation seems to warrant, a complaint will be issued and the alleged offender will be summoned to appear and face the charges made. If he is shown to have indulged in such unfair practices as come within the province of the commission, he will be restrained.

Thus may each individual citizen play a part in arousing the national consciousness to higher commercial ideals.



A Successful Test of International Amity



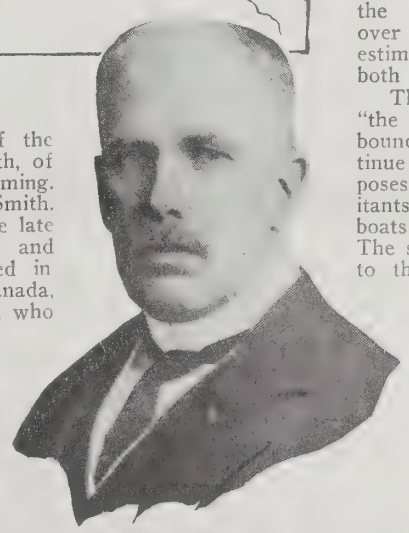
Joint Commission Prevents Disputes Between U. S. and Canada

By D. M. LE BOURDAIS

IN THESE days of disarmament conferences and arbitration treaties it is perhaps well to ascertain just what success has attended such experiments in international arbitration as have already been attempted. Of course, the most outstanding example of the value of disarmament—or lack of armaments—is the international boundary between Canada and the United States, the longest in the world, which by mutual consent has remained free from fortifications, and across which no hostile shot has been fired for more than a century.

Disarmament, however, is not sufficient. It is inevitable that where two countries adjoin each other for such a long distance there should arise from time to time questions affecting the interests of both on which it is necessary to have an equitable decision made. The international boundary is formed in some places by waterways jointly owned by both countries. There are streams which rise in the United States and flow across the line into Canada, such as the Red River in Minnesota and Manitoba, and the St. Mary River in Montana and Alberta; or which rise in Canada and flow into the United States, such as the Columbia in British Columbia and Washington; or rise in one country, cross the line back and forth and finally return to the country of their origin, such as the Milk River, which rises in Montana, flows into Alberta and Saskatchewan and finally back into the United States. The Kootenay is another. It rises in the Rockies, in Southeastern British Columbia, flows south into the United States, turns north again and recrosses into British Columbia, whence it joins the Columbia and as such returns to the United States. Lake of the Woods, which forms part of the international boundary between Ontario and Manitoba and Minnesota, is drained by the Winnipeg River northward into Lake Winnipeg and thence into Hudson Bay. It is to be expected that these international streams will often prove the occasion for conflicts of interest as between the people living on different sides of the line.

Above—SENATOR OBADIAH GARDNER. Map shows how streams cross and recross the international boundry.



Take, for instance, Lake of the Woods. The removal of obstructions at the mouth of Winnipeg River would have the effect of lowering the level of that lake to the possible detriment of riparian rights in the state of Minnesota; yet the works by which such increased flow might be effected would be wholly within Canadian territory, and under ordinary circumstances beyond the jurisdiction of United States courts not normally competent to deal with acts committed on foreign territory. Again, take the case of Milk River, already referred to. It is possible so to divert its course after it crosses into Canada as to reduce very greatly its volume when finally it returns to United States territory. Or, in the case of St. Mary River, it is possible to divert a large part of its water before it reaches the boundary at all. Obviously there are here abundant sources of international conflict. For much less cause wars have occurred elsewhere that have cost countless lives and untold wealth. Perhaps it was because of having no forts or soldiery along the boundary and no naval armaments on the Great Lakes that the governments of Canada and the United States have been led to look to other means for the settlement of the many problems which have arisen in relation to these international waterways. This agency is the International Joint Commission, which has lately been brought into more than usual prominence by its satisfactory settlement of the question of the distribution of the waters of the Milk and St. Mary rivers, which has been outstanding for a long time.

The commission traces its origin back to 1894, when a resolution was introduced by a Canadian delegate at an international irrigation congress held at Denver, Colorado, and unanimously adopted, urging on the United States Government "the appointment of an international commission to act in conjunction with the authorities of Mexico and Canada in adjudicating the conflicting rights which have arisen, or may hereafter arise, on streams of an international character." But nothing was done at that time.

The matter was taken up by the Canadian Government in 1896, but again no definite action resulted. In 1902, however, concurrent legislation was passed by both the United States and Canadian governments providing for the creation of a commission to investigate the whole matter and report on some plan of control. The findings of this body became the basis of a treaty dated January 11, 1909, and signed by the British ambassador, Mr. (now Lord) Bryce, on behalf of Canada and for the United States by Elihu Root, then Secretary of State, of which the objects as set forth in the preamble were as follows: ". . . . to prevent disputes regarding the use of boundary waters and to settle all questions which are now pending between the United States and the Dominion of Canada involving the rights, obligations or interests of either in relation to the other or to the inhabitants of the other, along their common frontier, and to make provision for the adjustment of all such questions as may hereinafter arise . . ."

By the terms of the treaty an International Joint Commission was provided for, into whose hands was to be placed control of the matters and subjects dealt with by the treaty. It was to consist of six members, three to be appointed by each country, of whom one member in each section would act as chairman, the United States chairman to preside over all meetings held in the United States and the Canadian chairman to do likewise when meetings were held in Canada. United States headquarters were established at Washington, and Canadian headquarters at Ottawa, with a secretary in charge of each place. All decisions or reports are made in duplicate and copies filed in each office. Regular meetings are held in Ottawa each year in October and at Washington in April, besides special meetings from time to time when and where required.

The three commissioners first appointed by the United States were: the late Senator Thomas H. Carter, of Montana; James A. Tawney, formerly chairman of the appropriations committee of Congress, and Frank S. Streeter, of New Hampshire. The present United States commissioners are: Senator O. Gardner, of Maine, chairman of the United States section; Senator M. A. Smith, of Arizona, and Senator C. D. Clark, of Wyoming. The United States secretary is W. H. Smith. The first Canadian commissioners were: the late T. Chase Casgrain, Charles A. Magrath and Henry A. Powell. Mr. Casgrain resigned in 1914 to become Postmaster-General of Canada, and his place was taken by P. B. Mignault, who was later appointed to the Supreme Court of Canada. Sir William Hearst, formerly premier of Ontario, was appointed to fill the vacancy, who with Messrs. Magrath and Powell constitute the Canadian section at present. Mr. Magrath is the Canadian chairman, and Lawrence J. Burpee, secretary for Canada.

C. A. MAGRATH, Canadian Chairman

The commission was given very wide powers. Its decisions are final; no appeal can be taken either by an individual or by either government. In the event of the commissioners being equally divided on some question it is provided that they shall make a joint report to both governments, showing the different conclusions arrived at, when the matter shall be referred to an umpire, chosen in accordance with the procedure prescribed by the Hague Convention for the pacific settlement of international disputes, whose decision shall be final.

Thus both countries voluntarily confer on this independent tribunal a certain portion of their sovereignty and place in its hands the final decision in regard to the control of these vastly important international waterways. So far their faith has been entirely justified. Practically every decision made by the commission in the 12 years since its inception has been unanimous; and its awards have been quite satisfactory to both sides.

The treaty recognized the requirements of public health as being of first importance, coming ahead of navigation, power or irrigation. And it was agreed that waters forming the boundary or the waters of streams flowing across the boundary should not be polluted on either side to the injury of health or property on the other. It was thus perhaps natural that one of the first matters submitted to the commission was in regard to the pollution of boundary waters. In 1912, the two governments requested the commission to investigate the whole matter and report on the extent of such pollution and to suggest proper steps to be taken to remedy the condition. As a result of this investigation the general principle has been established that "effective sanitary administration requires the adoption of the general policy that no untreated sewage from cities or towns shall be discharged into the boundary waters"—and that applies to lakes as well as to rivers. A rather unique feature of the treaty was that to all intents and purposes it abolished the boundary line in certain particulars: Each country reserved to itself, subject to existing interests, the exclusive control over the use and diversion of all waters on its own side of the line, which, in their natural channels, would flow across the boundary or into boundary waters; but it was agreed that any interference with or diversion from their natural channels of such waters on either side of the boundary, resulting in any injury on the other side of the boundary, "shall give rise to the same rights and entitle the injured parties to the same legal remedies as if such inquiry took place in the country where such diversion or interference occurs." In other words, an American has the right to go to Canada and seek redress in the Canadian courts against a Canadian citizen for injury suffered in the United States; of course, Canadians have the same privileges in United States courts.

While many problems have arisen, and do arise, with respect to streams having their origin in one country and which cross the boundary into the other, perhaps the greatest need for such a tribunal is in connection with the streams and lakes that constitute the boundary between the two countries.

The treaty defines boundary waters as "the waters from main shore to main shore of the lakes and rivers and connecting waterways, or the portion thereof, along which the international boundary between the United States and the Dominion of Canada passes, including all bays, arms, and inlets thereof, but not including tributary waters, which, in their natural channels, would flow into such lakes, rivers, waterways, or the waters of rivers flowing across the boundary." These waters, therefore, include portions of the St. Croix and St. John rivers, between Maine and New Brunswick; the St. Lawrence River, from Cornwall to Kingston; Lake Ontario, Niagara River, Lake Erie, Detroit River, Lake St. Clair, St. Clair River, Lake Huron, St. Mary's River, Lake Superior, the series of small rivers and lakes from Lake Superior to Rainy Lake; Rainy Lake, Rainy River, and the Lake of the Woods. The latter has been for many years a controversial point between Canada and the United States. So it will be seen that the commission has jurisdiction over waterways of practically inestimable value to the people of both countries.

The treaty also provides that "the navigation of all navigable boundary waters shall forever continue free and open for the purposes of commerce to the inhabitants and to the ships, vessels and boats of both countries equally." The same privileges were extended to the waters of Lake Michigan in so far as Canadians are concerned, although that body of water lies wholly within the United States and could scarcely be brought under the definition of the term, "boundary waters" as an "arm" of Lake Huron.

With respect to the question of the division of the waters of the Milk and St. Mary rivers in Alberta and Montana, the treaty provided that these rivers and their tributaries were to be treated as one stream for irrigation and power, the waters of which were to be apportioned equally between the two countries. These two rivers both rise in Montana and cross the international boundary into Canada. The St. Mary flows into a tributary of the South Saskatchewan and its waters ultimately find their way to Hudson Bay. The Milk, after a course of about 100 miles in Canada, returns to the United States, empties into the Missouri River, and eventually its waters reach the Gulf of Mexico.

This situation was complicated by the fact that a United States Federal irrigation project in Montana taps the waters of the St. Mary by a canal and diverts them into the Milk River. Both streams have numerous tributaries, some of which also cross and recross the boundary. While, as has been said, the treaty provided that these two rivers were to be considered as one, and their waters divided equally between the two countries, the method of division, the amounts of water at different periods of the year, and from each stream—these were matters which could not be settled in detail by a single treaty. And then there were questions regarding the actual interpretation and application of the terms of the treaty itself. For 12 years this matter has been constantly under review by the International Joint Commission. Dozens of special hearings have been held and numerous interim orders have been issued. On October 4, 1921, at Ottawa the commission handed down a unanimous decision setting forth finally the manner in which these waters shall be measured and apportioned; and this decision has met with general satisfaction on both sides of the line.

The total cost of the commission is less than $100,000 a year to each country—one of the cheapest forms of war-insurance imaginable.

Patagonia may be linked with what is now the thickly settled section of Argentina if officials are able to carry out their plans for constructing railways connecting with the present system. Six hundred and twenty-two miles of narrow-gauge railways are planned. The region for the most part is barren. Patagonia produces meat, wool and other products, and at present is linked with Buenos Aires only by irregular steamers, which makes it difficult for ranchers to market their products.

Forty thousand volumes of "Wild West," detective and Indian stories were piled up and burned in Berlin under the supervision of the Association for the Protection of German Youths. The association has given the owners classical works in exchange.

The Caruso Fund National Committee is collecting a $1,000,000 fund, to be known as the Caruso American Memorial Foundation. This fund is to be used in assisting deserving young musicians through scholarships and for the promotion of musical appreciation. One-half the income of the fund is to be used in promoting musical appreciation and the other half in making scholarship awards. Half the scholarship award will be applied to instrumental students and composition and the remainder to voice culture.

The American Legion Employment Bureau, of Louisiana, reports there is not one idle former service man in the state, the bureau having found work for every veteran seeking employment.

The ability of the natives of Peru to carry loads of 150 pounds up steep inclines at an altitude of 16,000 feet, where the ordinary person would fail, is to be studied by the Royal Society of London. Several scientists recently left London for Peru to test the strain to which the heart and lungs are subjected by carrying heavy loads at such great heights and to endeavor to discover the secret of the natives' resistance to the rarified air.

The old-time miner with his primitive methods of operation is not extinct. Two miners working with an old-fashioned rocker took out $10,000 worth of gold in six weeks recently in the Cedar Creek country of the Caribou mining district of British Columbia.

Schools for the children of migratory laborers were recently opened in the San Joaquin Valley of California. These schools will follow the laborers from place to place as they move from one harvest to another in search of employment. The last California legislature provided for the establishment of the schools, and they are conducted by the state department of education.

"Jewish Influence on American Life," Volume III in the series on "The International Jew," comprises a third selection of articles on the Jewish Question, and is now off the press. It contains 256 pages, and will be sent for the cost of printing and mailing, which is 25 cents.

"The International Jew," Volume I, and "Jewish Activities in the United States," Volume II, 235 and 256 pages, sent for 25 cents each.

Canada's new premier, Mackenzie King, has the distinction of heading the government of a country from which his grandfather was forced to flee as a "rebel" and serve a term in jail. In 1837, William Lyon Mackenzie, the grandfather, besieged Toronto with the intention of setting up a provisional government to gain wider autonomy for what is now the province of Ontario. The revolt failed and Mackenzie fled to the United States. He and his followers seized and fortified Navy Island, in the Niagara River. He was arrested at Buffalo for violating the neutrality laws of the United States, convicted and sentenced to prison, from which he was pardoned. He returned to Canada when that country granted amnesty to all who participated in the rebellion.

Paris traffic reformers propose to bar the horse from that city's principal streets to make way for motor vehicles. Horses would be used only a few hours at night and then only on unfrequented streets.

Washington state ships more than one-half of the box apple shipments transported in the United States.

It is now possible to transmit signatures by wireless from continent to continent, the electromagnetic waves traveling 186,000 miles a second. No receiving station other than the one intended can intercept the message, because the cylinder from which the message is sent and the one on which it is received must turn at exactly the same rate of speed. The rate of speed being predetermined, messages can be sent that will have no significance for any other receiving apparatus.

Automobile speeders brought before the Municipal Court in Detroit will be given five days in jail, regardless of whether it is the first or second offense, according to reports issued from the Municipal Court.

The last word in luxurious air travel is a monster machine built to carry 24 passengers at a speed of 130 miles an hour. It has all the features of a Pullman car, with the exception of observation platform. It contains a smoking room, with card tables; a bathroom, comfortable lounge chairs, which are converted into beds at night; an ice box, a stove and a kitchenette. Some of the late models have lookout cabins for observers, and one machine is furnished with two tail seats for the use of experienced air passengers.

A lunch consisting of gold-filled sandwiches and "hard boiled" eggs containing diamonds was taken from a passenger traveling between Eydtkuhnen, Upper Silesia, and Berlin. Pores of the bread had been filled with gold and carefully covered with butter, and the eggs had been emptied and refilled with diamonds.

A gyroscopic stabilizer will be fitted into the steamship George Washington, the largest ship owned by the United States Shipping Board now in operation. The stabilizer will weigh more than 100 tons and be 12 feet in diameter. The device will do away with the bilge keels and save about 2,000 horse power. It is set amidships and when in operation corrects the list of the ship in heavy weather.

The practice of cartoonists, makers of stage plays and producers of motion pictures in casting ridicule on the clergy has been condemned in a resolution which will be placed before the Louisville, Kentucky, Ministerial Association.

A new wood-preserving process employed in Germany consists of a hypodermic injection of a protective antiseptic in the freshly felled tree-trunk while it is still in the forest. The highly concentrated mixture quickly spreads through the tree tissues of the trunk by diffusion, as the tree is still full of sap.

A "Good Will Ship" is to sail to France next August, bearing delegates from all parts of the United States to the battle fields on which American soldiers fought. The delegation will present to France a purse to be used for rehabilitation work in the sections which American troops helped to defend.

The American Legion, of Detroit, favors the introduction in Congress and the immediate passage of a bill providing that any alien intending to make this country his permanent home and who has resided in this country for two years without making application to be naturalized, and who, after 90 days' notice, refuses to make such application, shall be deported. The Legion believes that foreign-born persons should show appreciation for advantages enjoyed here.

In the House Where Abraham Lincoln Died

And the 62 Years' Quest for Mementoes of the Great Emancipator

By AARON HARDY ULM

IN 1860 a lad of 19 ran a little news stand in his native town, Mount Vernon, Ohio. When he wasn't busy selling papers and copies of the few magazines then published, he collected bugs and plants and anything curious that seemed worth putting away. One day he found in the bundle of newspapers and periodicals which came to him from Pittsburgh, a paper-covered pamphlet, entitled, in big, flamboyant type, "The Life, Speeches and Public Service of Abraham Lincoln." It was a sample copy, it being the policy of the distributors to put into the bundle specimens of anything new which came along, the understanding being that if the sample was not sold it could be returned.

Instead of offering the pamphlet for sale, the young news stand proprietor read it. And when he read it he decided to neither sell nor return it to the distributors. For, though a cheap campaign document, it caused him to vision the immortality that was to come to its subject. He resolved to make it the first item of a collection of material having to do with Abraham Lincoln, who was then making his first campaign for the presidency. He points it out to you now—displayed prominently among 4,000 to 5,000 items collected during 62 years devoted almost wholly to the gathering and preserving of relics of the Great Emancipator.

The young man's name was Osborn H. Oldroyd. He is now in his 81st year, but is as active as a healthy man of 60, and he still would gladly walk 10 miles any day to get some little object that bears intimately or importantly on the life of his hero, the first of our martyr-Presidents.

His collection of Lincolniana is the greatest in existence, and some say it is the greatest collection of relics of one man ever gathered anywhere at any time. In it you find objects used by or associated with Lincoln at every period of his life—clothes that he wore, the Bible from which his mother read to him and on the flyleaf of which he wrote his name when he was not more than nine years old, letters penned by him, chairs and other furniture used by Lincoln in his home, photographs, prints and newspaper clippings innumerable. Much of the collection has more than mere association value; it could be of great assistance to historical accuracy.

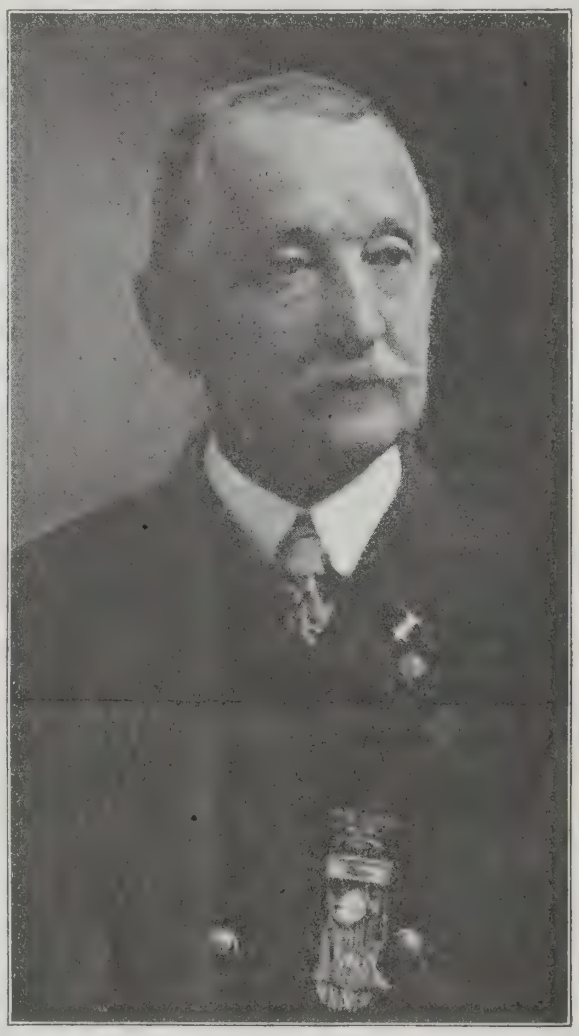
It is housed in the building on 10th street, Washington, where in the early morning of April 15, 1865, Abraham Lincoln died from the wound inflicted by John Wilkes Booth in a box at Ford's Theater across the street on the evening before. It has been there for nearly 30 years, the house being owned and furnished free by the government for the use of the collection, which is still the private property of Mr. Oldroyd. A vagrant spark, a carelessly tossed cigaret or cigar stub, an exposed electric wire might at any time mean the destruction of the collection and the building which, of course, is itself a sacred bit of Lincolniana.

Mr. Oldroyd takes you into a backroom and points out, as it hangs in a weather-worn display case, the first of his Lincoln relics, the old campaign book of the '60's. It sold then for 25 cents; a first edition copy of it now probably is worth hundreds of dollars. It has an important secondary value, for it was the first book written by William Dean Howells, who, long before his death which occurred only a short time ago, was the recognized dean of American letters.

Mr. Oldroyd entered the Civil War, at its beginning, as an enlisted man in the 20th Ohio Regiment and served throughout the conflict. One day, near the close of his army service, his regiment was halted while on the march near Murfreesboro, Tennessee. The commander read a message which told of Booth's assault. The troops were taken back to camp, where three bulletins were posted in the order of their arrival. One told of the attack, the other of Lincoln's serious condition and the last of the President's death.

"I asked the adjutant if I couldn't have those bulletins after they were no longer needed for display," says Mr. Oldroyd.

"Make and post duplicates and you can have 'em now," the officer replied.



They mark the after-war resumption of Mr. Oldroyd's collecting. Returning home, he held several state positions at different times during 10 or 12 years, but devoted all his spare time to hunting and all his spare dollars to buying, when buying was necessary, relics of his hero.

He became so entranced with his subject that he decided to make its pursuit a life work. He moved to Springfield, Illinois, and rented the old Lincoln home and lived in it for 20 years or more, and searched all the country around there for mementoes of Lincoln.

The Lincolns sold their household goods when they moved from Springfield to Washington, but Mr. Oldroyd managed to recover several of the items. They are on display in the Washington house. There is an old-style horsehair sofa, several chairs and tables and the cooking stove on which Mrs. Lincoln cooked the last meal she served her husband in their old home, and Lincoln's old Springfield office chair and desk.

A huge cradle, the like of which you never see now, was recovered also and is now in the Oldroyd collection. In it the Lincoln children when infants were rocked.

In the collection there is a fence rail which

OSBORN H. OLDROYD,

Who, when keeper of a news stand in Mt. Vernon, Ohio, in 1860, began collecting relics of his great hero, Abraham Lincoln, and has given nearly all his time since to the task.

was split by Lincoln when a boy. Its authenticity was attested by John Hanks, the first cousin, who taught Lincoln to read. There are numerous other curious relics of like kind, perhaps the most interesting of which is a pass through the Union lines in Virginia—or rather a statement written on a White House card to the effect that no pass was needed—in Lincoln's handwriting and bearing his signature. It was written the evening before he was slain. It is the last bit of writing that survived the martyred President. It, with one of the very few surviving locks of hair, was owned by a man who was an usher at the White House at the time of Lincoln's death. For 14 years Mr. Oldroyd tried to buy the two relics, but the owner refused to sell at any price. Then the owner died and the widow also refused to sell. After a long illness, the widow died and her sister sold the relics to procure money with which to pay the widow's doctor bills and funeral expenses. It required 20 years' pursuit and finally a substantial sum of money to obtain the two relics.

But mere curios make up only a part of the collection. It contains more prints and pictures of and having to do with Lincoln than perhaps are in any other place, though there are other good collections of those items alone. Mr. Oldroyd has a complete set of all the cartoons published by London *Punch* on Lincoln. They tell the story of Lincoln's career in the White House from the British viewpoint and give splendid insight into the British attitude toward several international questions which arose during the Civil War between the two countries. He also has a large collection of cartoons of Lincoln that appeared in American publications. Most of them are amusing and some even are vicious; all show that the Great Emancipator did not escape the satire and the humor of the cartoonists of his day. He also has a vast collection of clippings taken from newspapers published as far back as the time of the Lincoln-Douglas debates, as well as from the current publications during Lincoln's campaign for the presidency, and at the time of his assassination and the trial of those involved in his murder. He has more than 100 pictures having to do with the assassination and funeral, nearly 50 photographs of Booth, the assassin, and the only complete set of photographs of all those convicted of conspiring with the actor. Among his clippings there are more than 200 complete, or reports of, sermons delivered at the time of his death, on Lincoln's life and character, and 227 autographed tributes and reminiscences of famous men and women. The collection contains more than 20 statuettes, busts and life and death masks of the Civil War President, nearly 30 medallions and nearly 200 political and memorial medals struck in his honor. He also has more than 100 different photographs of Lincoln, taken at different periods.

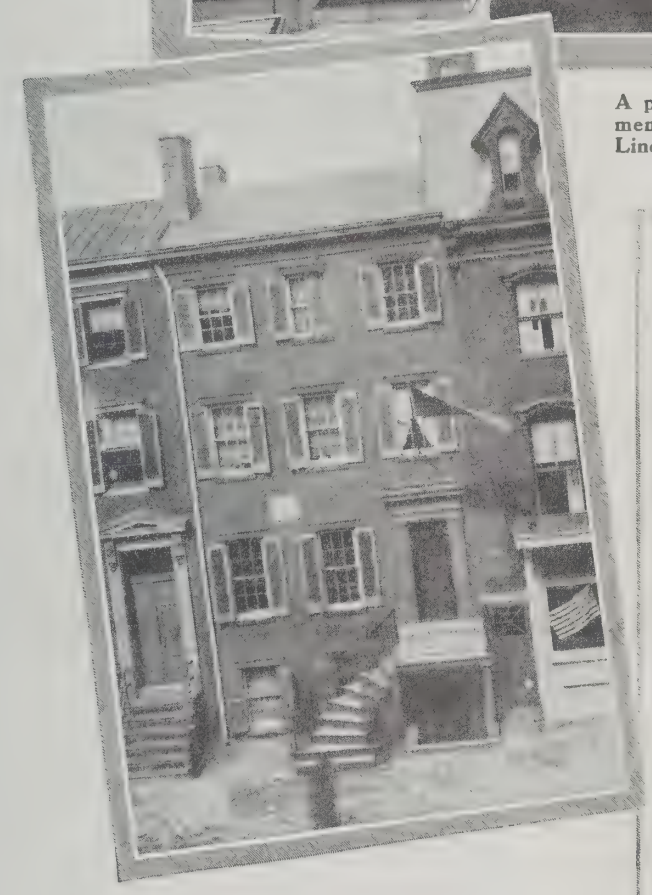
Except for the removal of the furniture and the presence of many mementoes of the occurrence, the room in which Lincoln died stands now very much as it was at the time of his death. Even the same paper, now blanched and broken, is on the wall, and the same wide pine boards constitute the floor.

It would seem that the fates wanted the Great Emancipator to die amid humble surroundings, as were those of his infancy and youth, for the house wherein he breathed his last was not an imposing structure, even in the '60's. It is a three-storied, narrow, brick building. When the dying President was taken there it was a lodging house, and the room to which he was carried was among the humblest in the dwelling. It is a narrow room, at the end of the first-floor hall; it was taken probably because of its convenience.

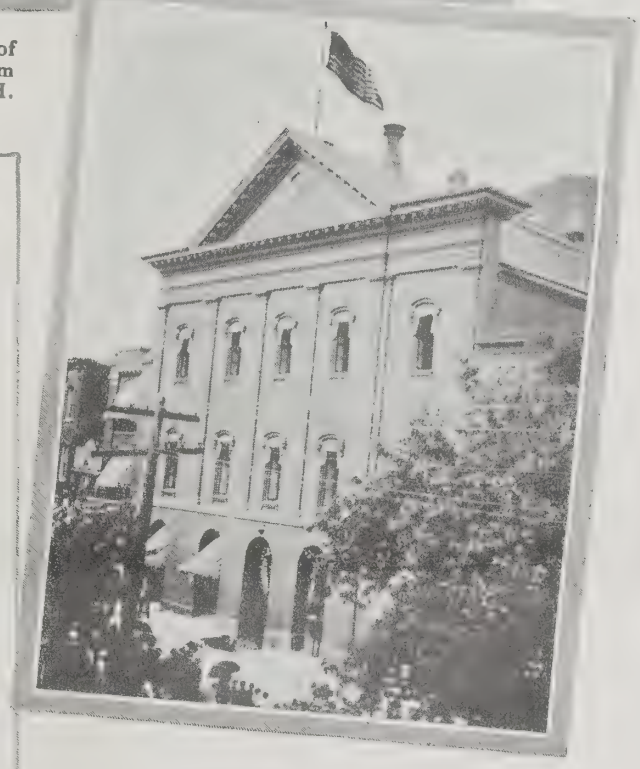
Only two who were present at the President's death are alive. One is his son, Robert T. Lincoln, and the other Dr. Leale, who lives in New York.

The theater building, in mostly reconstructed form, still stands and is the property of the government.

For many years Congress seems to have intended to take over the Oldroyd collection of Lincolniana and make provision for preserving it and the historic building which houses it. The building was occupied by Mr. Oldroyd in 1893. Prior to that year the collection was on display at Springfield, in the old Lincoln home, which Mr. Oldroyd induced Robert T. Lincoln to give to the state.



After the Springfield place came under the control of the state, Mr. Oldroyd was made its superintendent, but a change in the governorship caused him to lose his place. He was preparing to auction off his collection when the Washington Memorial Association asked him to take it to the National Capitol. The house in which Lincoln died was rented for it, but for long admission fees failed to provide expenses. Congress bought the house and for more than 15 years has given it rent free to Mr. Oldroyd for his collection. A sign kept posted in the museum says that whenever Congress or others provide means for meeting the expenses of conducting the place, admission will be free.



"I hope Congress will take over the collection and let it become government property," Mr. Oldroyd declared. "The government can have the collection at whatever price it wants to pay. I have no hope of getting as much from the government as I could get by selling the collection piecemeal, but I want the collection to stay in Washington and preferably in this building, which should be safeguarded by being fireproofed. These things should be here where any one might come and see them and at the same time see where the great man died.

"Such relics as these vitalize the memory of him who was associated with them. They prove that the hero was a human being and not a mere copper-plate image which idealized persons long dead tend to become in the average mind."

A partial view of the thousands of mementoes and relics of Abraham Lincoln collected by Osborn H. Oldroyd.

Hearst Papers Please Copy

SURELY there can be no greater test of supreme patriotism than that a man shall lay aside without regret his personal enmities, his established customs, nay his cherished principles.

Goodness knows how difficult it is for us small humans to forget even the most insignificant of slights put upon us. But for a man to rise to a height of renunciation which obliterates all bygones of whatsoever magnitude that his country may attain to that which he holds most valuable—that, indeed, is worthy of the highest praise.

Consider the case of William Randolph Hearst.

Mr. Hearst feels—has always felt, in fact—that no greater good could come to this country than that he run it. His heart, bubbling with national pride, is filled with the commendable feeling that his fellow-citizens should have some great living monument at which they could point with pride, some great noble figure in high position before whose outstanding genius all the world would stand in envy.

"And who," asks Mr. Hearst, "is best fitted to enact this radiant rôle?"

"Who," comes the reply, which crescendoes onward from his office through editors, reporters, copy boys and the municipal employes in Hearst-run cities, "who but William Randolph Hearst!"

Mr. Hearst has been Congressman. He has been willing to serve as mayor of New York, as governor, as President.

At the moment, it is to the United States Senate he is willing to lend the luster of his name. And to afford the Senate that great boon, he seems willing to forgive, to forget, to renounce.

From New York, whence comes the report of his expected candidacy, we also hear coincidently that Mr. Hearst is willing to permit Alfred E. Smith's name to be on the ticket with his own. Mr. Smith can run for governor, Mr. Hearst is understood to have ruled, thus adding to the Democrats a group of votes which would minister to the country's need for Hearst as Senator. Something calls to mind the bitter, blasting, blistering array of superlatives with which the Hearst papers paid their respects to Mr. Smith while he was governor. The mildest thing they said was that "Al" should go back and peddle his fish.

But that's all past and gone. Mr. Hearst will forgive him now, and the governor's friends and followers may manifest their penitence by casting their ballots for Mr. Hearst.

And then there is Charles F. Murphy, boss of that notable institution, Tammany Hall. Hearst editorials and Hearst cartoons, with nice discrimination, meted out to Boss Murphy the same degree of bitter scorn they had aimed years previously at the gentle president, William McKinley, before an assassin's bullet sent him to his grave.

But that's over now. Boss Murphy can hand Mr. Hearst the Tammany designation for United States Senator, and thereby expiate his past offenses.

There have been times when Mr. Hearst has not approved of the Democratic party. Indeed, it is difficult, offhand, to remember just when he did.

But Mr. Hearst does not permit minor inconsistencies to interfere with the vast consistency of his candidature for high office. Those who have called him names will be forgiven if they minister to his momentary candidacy. The names he has called others will be wisely pigeonholed while his candidacy endures. The disorders in Mexico which long inspired his warmest editorials become less disordered under Mexican administrations which keep their troublous bands away from the Hearst estates. Though Mr. Hearst has aspired to be Congressman, mayor, Senator, governor and President, between times he has found time to dictate the city administrations of some of our larger municipalities. In attaining these dictatorships and in seeking to have his own name glisten brightly in the political sun, Mr. Hearst has been obliged to accept the assistance of many elements and individuals, regarding whose characteristics or individuality, he has platitudinously and specifically expressed the most biting scorn.

However, there is no doubt that Mr. Hearst looks upon his own elevation to high office as the greatest good which might come to the state or nation. So his indiscriminate acceptance of all kinds of support may be viewed as a sacrifice on the altar of high patriotism.

Good Taste

GENERAL PERSHING showed a sense of propriety, becoming to his rank, in declining the Distinguished Service Cross which the Secretary of War thought to confer on him for an exploit in the Philippines years ago.

Americans have always been more or less amused at the be-medaling impulses of some of the Latin-American Republics, and some of the militaristic Continental nations. The award of the Distinguished Service Cross or Congressional Medal of Honor is justified only by the rarest of exploits, outside and beyond the duty of the soldier or sailor honored. The American theory has been that pure courage and devotion to duty are to be expected from all in the nation's service.

The prodigality with which some of the nations distributed medals threatened, toward the close of the World War, to disturb the well-balanced limitations established by American custom. General Pershing's wise modesty should restore the realization that honors cannot be spread thin and still retain their flavor.

The Bonding Mania

ONE of the worst curses to the taxpayer is the mania for bonding for public improvements, whether needed or not.

Newspapers in reporting the bids received for municipal bonds boast of the good credit of the place issuing them, pointing to the premium paid by the syndicate awarded the issue. Such a premium is proof that the bonds bear *too high a rate of interest.* When put on the market by the broker he quotes them at a higher premium and exacts the accrued interest. That is, a bond bearing six per cent will cost the real investor from four to six per cent premium. Thus the municipality pays a rate one per cent higher than the real investor realizes as interest. The broker pockets a profit of one per cent less the insignificant premium the papers boast of as showing the high standing of the city.

It is as unwise for a political unit to run into debt as it is for an individual to do so.

For the Sake of Votes

THE Lower House of Congress after solemn deliberation recently passed an "anti-lynching" bill. The vote coincided roughly with the partisan division of northern Republicans and southern Democrats.

Theoretically, the object of the bill was to reduce lynchings, which have had for their most numerous victims the Negroes living in the South. Actually, the object of the bill was to cater favor with Negro voters, who are numerous in some of the northern voting centers.

Theoretically, the opposition to the bill was inspired by the altruistic belief that Federal interference with state officials for shortcomings in punishing lynchers, is an unwarranted and dangerous extension of Federal paternalistic rule. Actually, the opposition felt that the southern voters would resent any vote which might be construed as catering to Negroes.

Negro voters may look forward with confidence to the appearance shortly of some franked copies of the *Congressional Record* in which the sufferings of their race are eloquently denounced. So, too, ardent upholders of the Old South may enhearten themselves with the thought that printed patriotism, of their own particular brand, will soon be delivered free.

As for the bill, if it becomes a law, there are few southerners who fear that it will have any more effect than did the constitutional amendment giving the Negro the vote. Neither do the northerners.

But viewed simply as an arrangement of words, the measure is entirely commendable. So, too, would be a constitutional amendment prohibiting murder.

Mr. Hays and the Pictures

THE mystery of Will Hays, as he is about to enter personally, as advertised, upon the management of the movies, begins to take speculative form. After the Sunday school motif had been duly exploited, namely, that Mr. Hays was going into movie management to stop their extreme and nauseating naughtiness, the sober second thought of the sophisticated began to play with interesting results. Aside from its being regrettable that the movie kings could reach into the President's cabinet and, by the pulling power of a spectacular salary, lift out a promising cabinet officer, it is fraught with menace in a number of directions.

Mr. Hays is described as "the Landis of the Movies." This is an unjustified comparison. Baseball needed cleaning out, but Judge Landis was not hired by the men who were to be cleaned out. On the contrary, Mr. Hays *is* hired by the men who ought to be cleaned out if the movies are to be brought up to an American standard. The source of the rottenness in the movies is the source of the movies themselves, in the grade of control that has been exercised over them, and that control has been exercised without let or hindrance by Adolph Zukor, Carl Laemmle, Hiram Abrams, Lewis J. Selznick, Samuel Goldwyn, Marcus Loew, William Fox. These names are not all of them the real names of the men designated, but they are the names by which the controllers of moviedom are known. They are the men who have agreed to pay Will Hays $150,000 a year to clean up the movies. And where shall he begin, if not with his own bosses?

The price, the spectacular gesture of repentance, indicates the desperate plight into which the indecent motion picture had been forced by the moral indignation of the American people. Indeed $150,000 is a mighty low figure at which to buy off the moral indignation of the American people. It is reckoned as one per cent of the possible $15,000,000 a censor's insistence on decency would cost. Mr. Hays realizes, of course, that this is precisely what he has been chosen to do, namely, to head off the righteous wrath of the American people. The crowd which ran the movies into the deepest possible pollution went to the President's cabinet, acquired an unquestionable American, a Presbyterian elder, in fact, to do the work of heading off. If it is done it is worth a thousand times $150,000 to the movie kings, and it means further incalculable damage to American character.

As far as we are aware, Mr. Hays had never shown any interest in reforming the movies prior to this business engagement. If he had been the least stirred toward that needed reform he would have known that as Postmaster-General of the United States he could have been a greater force in compelling the movies to clean up than he can possibly be as the movies' hired man. Any Cabinet member, standing up in his place today against the torrent of degeneracy poured by the film into the American people, any Cabinet member whatsoever could do more for clean movies in the next thirty days than Will Hays, as movie employe, could do in five years. Mr. Hays by resigning from the Cabinet has lost his best opportunity to serve the people in this matter.

It becomes clearer that Mr. Hays will not exclusively serve the people. The movie kings know what they want. One thing they want is a tariff against foreign films. Under the exploitation of Messrs. Zukor, Laemmle, Abrams, Goldwyn, Fox, Selznick and Loew, American films have lagged far behind in progress. These men did not invent the film, have not improved it, have only exploited it. Other countries have forged far ahead in both the mechanical and artistic elements of film production. Now that these foreign films are beginning to appear in this country and are making their undoubted superiority felt, the movie exploiters want them kept out by tariff. Mr. Hays would be very useful on the political end of that matter.

Again, the movie kings do not want a censorship. They fear a censorship. An *American* censorship would damn them irretrievably. They offer Mr. Hays in *lieu* of a censor. They use his name as a guarantee. He may be useful in this matter; time alone will tell.

And then, Mr. Hays is much interested in the continuous success of the Republican Administration. The tens of thousands of screens with their hundreds of millions of spectators would be a very useful adjunct in a campaign. The movie men would gladly promise, *and could deliver,* the movie screen to any party granting a tariff and preventing a censorship, and they would also agree to the appointment of a man to see that the movie men's side of the promise was carried out.

These are the forms public thought has taken. One thing is certain: in leaving the Cabinet, Mr. Hays lost his best opportunity to make the movies better. We wish him luck, but it looks mighty unlucky just now.

Mr. Ford's Page

THE education of humanity is a slow process, but not so slow as it was a little while ago. That should always be borne in mind—not so slow as a little while ago. People are still to be found who imagine that we are traveling on the schedule of a hundred years ago, when the birth of a new idea was a slow and laborious process, and the induction of that idea into public acceptance was a process slower and more laborious. But the schedule has changed. The people are becoming accustomed to deal with ideas, and more can now be accomplished in five years than was formerly possible in a hundred.

This has nothing whatever to do with the so-called "feverish" pace at which we live. People who are not carried away by the lures of the entertainment and fashion world—the street life of the times—are not "feverish" by any means, they are going along at about the gait they desire. But it has a great deal to do with growing intellectual ability on the part of the people, and an improvement of their instinctive judgment on matters of importance.

One hundred years ago it was only certain groups that caught the idea, and they in turn, by virtue of their leadership, put the idea into action. They had the confidence, not the understanding cooperation, of the people. But nowadays, the ideas which move the world are sowed and nurtured in the great mass of the people, and the tendency of group ideas has been toward fantastic impossibilities or anti-social reaction. The impossible radicals and the equally impossible reactionaries, are the minority who pull off their little stunts at the side of the road while the human race sweeps on and up.

No one would say, however, that all the good ideas have yet been sown. Not at all. Only the soil has been prepared. It is good soil, too, because it will not grow wrong ideas. The ideas that certain sowers think would prove popular because they are pleasant don't grow at all in the newly prepared soil of the common mind, while hardy ideas, which at first look crude, grow into stature and strength. Many sowers observe how promising the soil of the public mind has become, and are busy casting the seed of their theories, but a soil that has been abused for generations by the fallacies of the self-seeking, has simply refused to fructify them any more. The mass mind is receptive only of those ideas that are unselfish and true, serviceable and durable.

That is, although people do not know it all yet, they are readier to know, are more capable of knowing, can choose the right thing with more unerring speed, than ever before. That constitutes the main hopefulness of the times. If the people had not been fooled so often before, it might be expected that they could be fooled again: but they have been fooled so much that the danger of great future deception is past. They are immune, so that is one great danger out of the way.

One of the new ideas which will take root and grow and change the face of our system, is the idea of diversity. We have been using certain things just one way, we have been sending certain goods along only one channel—and when that use is slack, or that channel is stopped, business stops, too, and all the sorry consequences of "depression" set in.

Take corn, for example. There are millions upon millions of bushels of corn stored in the United States with no visible outlet. A certain amount of corn is used as food for man and beast, but not all of it. In pre-Prohibition days a certain amount of corn went into the making of liquor, which was not a very good use for good corn. But through a long course of years, corn has followed those two channels, and when one of them stopped and general business dropped off, the flow of corn dwindled and the stocks began to pile up threateningly.

WE ARE too tightly tied to one-way uses of materials. The result is that when one use falls off, the material piles up; there are no other ways to consume it. Corn was largely confined to two uses—hogs and whisky. And now corn is piling up in the country. The uses of corn have not been developed, and therefore many farmers literally have corn to burn. There are other uses for corn besides food; corn could produce fuel alcohol and oil. The more uses it had, the more surely would the crop move and become profitable. One of the economic defenses we can raise is to create a large range of diversity in the use of materials. Single-track systems are too liable to tie-ups.

Every one knows, of course, that there is plenty of food in the country, enough to last us without distress for several years. The storage places are filled with foodstuffs. There need be no doubt on that score. In emergency there would be no starvation in the United States, money or no money. It is the money fiction that retards the movement of these stores today, but even if money were plentiful we could not possibly consume the stores of food which we possess.

Now, the idea which is born of those facts is that: if foodstuffs can become too plentiful ever to be fully consumed as food, why not find other uses for them? Why use corn for hogs and distilleries; and because the distilleries are closed and the hogs cannot consume all that is left, why sit down and bemoan the terrible disaster that has befallen the corn market? Is there no use for corn besides the making of pork or the making of whisky? Surely there must be. And if so, what is it? The voice of wisdom is this: there should be so many uses for corn that only the important uses could be fully served; that in times of fluctuation there might always be enough channels open to permit corn to serve its uses without waste.

Once upon a time the farmers burned corn as fuel, the corn was so plentiful and the coal was so scarce. Well, that was a crude way to dispose of corn, but it contained the germ of an idea. There is fuel in corn; that is, there is oil and fuel alcohol obtainable from corn, and it is high time that someone was opening up this new avenue so that the stored-up corn crops can be moved.

That is merely a side light on the idea of diversity. Why have only one string to our bow? Why not two? If one breaks, there is the other. If the hog business slackens, why should not the farmer have an option to turn his corn into tractor fuel?

We need more diversity all round. The four-track system everywhere would not be a bad idea. We have a single-track money system. It is a mighty fine system for those who own it. It is a perfect system for the interest-collecting, credit-controlling financiers who literally own the commodity called Money and who literally own the machinery by which money is made and used. Let them keep their system if they like it. But the people are finding out that it is a poor system for what we call "hard times" because it ties up the line and stops traffic. If the people had another money system, a second track, an auxiliary method, by which they could keep going while the speculative financiers were untangling traffic on the bank track; that is, if the shop track and the farm track could be kept clear for the workingman's business and the farmer's business, instead of all being blocked on the banker's track behind the broken-down financial caboose, it would illustrate one of the beneficial aspects of this diversity we are discussing.

It is the adage about putting all our eggs in one basket; it isn't a wise thing to do. We ought to have a number of baskets. If the bottom falls out of one, we have the other.

If there are special protections for the interests, there ought also to be special protections for the plain people. Special privileges are all right, provided they are shared with the people, whose guaranty alone makes them worth something.

In diversity of outlet, and of use, and of financial enablement, is the strongest defense we could have against economic emergencies. And with it would come a greatly diversified yet unified general intelligence.

Trying to Solve the Greatest Riddle of Science

Chemists Hunt World's Smallest Thing; It Affects Lives of All

WHILE explorers have been attempting to accomplish a feat never yet attained, that of climbing to the top of the loftiest pinnacle in the world, Mount Everest, in the Himalayas, three miles higher than Pike's Peak, men of science in their laboratories have been essaying a very similar journey into the unknown. Chemists have been trying to go the whole distance to the smallest thing in the universe, the electron, and there to take observations. As Mount Everest is known to exist, standing there white-robed before the world, so does science know that matter has its final division into these infinitesimally small electrons, but as Everest defies the explorer so does the electron throw down the gauntlet to the knight of the test tube.

Those of us who studied chemistry 10, 15, 20 years ago marveled much at learning of the manner in which the molecule was put together by the combination of the atoms of different substances. H^2O, for instance, was the chemical formula for water. It meant that two atoms of hydrogen and one of oxygen combined chemically to make this liquid. The molecule was the primary building block of a substance like water, for instance, which was made by uniting two elements like hydrogen and oxygen. Elements were fundamental, existed as they were, were the result of no combinations. They were made up of atoms. The atom was the end. Nobody thought of going beyond it.

The expedition on which various scientists of today are embarking is that of taking this atom apart, of finding the units of which it is composed, of studying the natures of these units. They are actually doing just this. In doing it they are learning what it is that makes lead lead and gold gold, and how one may be changed to the other.

The smallest building block of the scientist of yesterday was the atom. The new discovery is that atoms are made up of yet smaller units called electrons. As far as even the scientific theory of today goes the electron is the smallest subdivision of matter. The electron is the primary building block of which all substances are constituted. There is no physical thing in all the world that isn't made by putting together various combinations of these electrons. The nature of primary elements of which the universe is made depends on nothing else but the arrangement of these electrons in the atom. The lead atom, for instance, has 82 electrons in it and the gold atom has but 79, but the electrons are just alike.

And this electron, which constitutes all matter, you may ask, what is its habitat, where does the average man ever actually see it at play? The answer is that when electricity goes scurrying over a wire, then and there are these electrons in the course of migration. When you stroke the back of a cat it is an electron that snaps at you. When you break your arm and go to an X-ray photographer and he makes a picture of your bones showing just what has happened to them, it is these same electrons that have gone unfelt through your flesh and made the picture. When Madame Curie's radium eats into the core of a cancer and cures it, it is these isolated electrons that have penetrated to the dugouts of the disease and turned it out.

So small is an electron that the most powerful microscope in the world could not see it. If one counted electrons through an active threescore years and 10 and bound them together he would not have enumerated enough of them to be visible to the naked eye. If one conceived a grain of sand, a smallish grain of sand about the size of the head of a pin, and if he should contrast that grain of sand in its physical dimensions with the whole world it would appear infinitely small. But as that grain of sand is to the world, so is the electron to the grain of sand. To the electron this grain of sand is a great world 25,000 miles around.

So, these are pretty small things we are working with. Yet, infinitely small as electrons are, so marvelous are the devices of science that a way of counting them has been found. Take, for example, the electrons that go over a wire when a current is turned on. When one puts his foot on the button which starts the engine of his automobile, for instance, he starts great flocks of these electrons to galloping past. If he turns on a single ampere of electricity he lets past in a second six million million million electrons. The average starter button, as a matter of fact, releases 300 amperes of electricity. So, each second that your foot is on the button, you let go romping by 1,800 million million million electrons, which is quite a crowd with the gate open so short a time.

It is the pursuit of this infinitely small subdivision of matter, its capture and its taming, that is to the scientist what the climbing of the greatest of the world's peaks is to the explorer. While, however, the exploration of the tallest peak of the Himalayas is largely a matter of sentiment and adventure and is not expected to yield great practical results that will affect the everyday life of the masses, this pursuit of the electron is quite sure to produce results that will make different your daily life and mine and that of every other civilized being in all the world. The mastery of the electron will be the final solution of the riddle of the composition of matter. Man couldn't have razor blades until he knew substances, for example, what iron ore was made of. In just the same way this new knowledge of electrons may be expected to work.

A comprehension of the electron and the manner in which it is the structural unit in the composition of matter was first approached by a young English scientist, H. G. J. Mosely, back in 1914, just before the outbreak of the Great War. Mosely couldn't see the electrons any more than you can see X-rays or the rays from the radium, but he could put them to work and make a record of what they did. He could cause them to write this record on photographic plates, which were very sensitive to them. He began to notice that each element left its distinctive track, just as different as is the track of a horse from that of a dog. Mosely studied these records left by the X-rays of the various elemental substances. He found that these rays had certain relations to each other. The structure of hydrogen, the simplest of the elements, left a track showing it to have but one toe. The structure of the next simplest, helium, the balloon gas which will not explode, had two toes; the next had three, the next five, and so on, until the track of the most complicated of all elements was found to have 92 toes. The X-ray photographs of these elements showed a range from one to 92 in the unit of their structure. The conclusion that Mosely drew was that there are in all the universe but 92 independent elements and that everything else grows from combinations of them. These 92 vary in accordance with the number of electrons which go to make up their atoms. An atom with three electrons in it mixes into a different sort of mortar than does the atom with six electrons in it. The number of electrons in the atom tells the whole story.

Having laid down this fundamental theory of the constitution of matter, young Mosely went away with the British to help stop the rush of the Germans and was killed, thus constituting one of those sacrifices to war, the value of which can never be measured.

The greatest distinction that a scientist has considered it possible to attain has been that of the discovery of a new element. Whenever one of them succeeded in isolating an element, as Madame Curie, in this generation, isolated radium, it was set down opposite his name and there occupied its place in the chemistries of the world for all time. And from the beginning of time until the present only some 84 individuals have attained this distinction, for there are but 92 elements, eight of which are still mysteries.

Mosely established this gamut of the elements by his X-ray photographs, which showed hydrogen with a single electron, helium, the balloon gas, with two electrons; sodium with 11, gold with 79, mercury with 80, lead with 82, radium with 88, and finally, uranium with 92. All the other steps in the combination of electrons to make up these elements have been discovered but eight. Eight more elements remain to bring scientific fame to the men who first isolate them.

Mosely's theory has been worked over, re-demonstrated, proved, established, during these last eight years. Men of science are now awakening to the realization of the fact that there lies just ahead of them one great problem, which, if it can be solved, will undoubtedly be the greatest accomplishment of that science since time began. Since elements are made up of electrons, and since the difference between them lies merely in the number of electrons which their atoms contain, it is obvious that the nature of elements is dependent on nothing but this arrangement of electrons. If science can change the arrangements of electrons, it can change one of these elements into another. For example:

It is established that the atom of the element gold contains 79 electrons, 79 of these little structural building blocks. The substance closest akin to gold in the manner of its construction is mercury. The atom of mercury has in it 80 electrons. So it becomes obvious that the only difference between mercury and gold, so unlike in appearance and qualities, is that the mercury has one more building block than gold in its atom. If that one building block can be displaced the atom will have 79 electrons instead of 80, and will be gold instead of mercury. Thus will the age-long dream of the alchemist become possible and thus will the transmutation of matter be a reality.

Little groups of advanced scientists are here and there working on this problem of taking apart the atoms of the different elements, of removing an electron here and there and thus changing the nature of those elements. When this riddle has been solved it will be possible to run the gamut down the scale and change one element into another. Thus will it become possible to make the maximum use of those substances which exist in matter, for the less useful may be changed into the more useful and the supplies of the more useful become virtually unlimited. Thus may lead be transmuted into gold and gold into platinum. Thus may the whole basis of values of rare and precious metals be removed and the world brought to the necessity of developing other yardsticks.

DR. PAUL D. FOOTE

Of the Bureau of Standards, who is pursuing the electron.

And this problem of the transmutation of metals—how is it that the man of science approaches it?

The writer has just been to one of the few great scientific agencies in the world which wrestles with these advanced problems. This agency is the Bureau of Standards of the Government of the United States, at Washington. The bureau is this government's lawfully constituted agency in keeping abreast of the scientific developments of the world.

In one wing of one of the laboratory buildings it has a group of young scientists working on this task of the isolation of electrons and the transmutation of substances. It was Dr. Paul Darwin Foote, of these laboratories, who explained the pursuit of the electron and gave a measure of the task ahead. He asked the writer if he had ever seen in a photographic laboratory the so-called mercury lamp radiating its peculiar green light. That light is quite properly called a mercury light. The chief feature in its construction is a tube filled with mercury that has been converted into the form of gas. Through this tube is passed a current of electricity and this peculiar light results.

Scientifically, a very peculiar thing is happening within this mercury tube. In its gaseous form the atoms of this mercury are spread out in a quite flamboyant way. They float about somewhat as do particles of dust in a sunbeam. Each of these atoms of mercury contains 80 building block electrons. So, there you have it—the mercury atom suspended in mid-air with its checkerboard of building blocks turned face on.

Into this situation is introduced the currents of electricity and these currents of electricity, it must be remembered, are sprays of electrons, shot much as are the bullets from a machine gun. A great volume of fire is shot through the area where the mercury atoms are suspended target-like. The targets are being overwhelmingly bombarded.

In this bombardment certain of the electrons in the mercury atom are hit. When they are hit the blow is sufficient to knock them a bit out of place, but not sufficient to entirely dislodge them. The agitation of their displacement and their coming back into position is the action which causes the green light in the mercury tube. Were the blow which the mercury electron receives sufficient to entirely dislodge it from its atom it would remain an atom constituted of 79 electrons instead of 80 electrons, and that atom would be an atom of gold and not of mercury. Transmutation would actually have taken place. The photographer who turns on his mercury lamp has, though he knew it not, been approaching very near to accomplishing that feat which has corrugated the brows of the alchemists through the ages.

In the laboratories of the Bureau of Standards efforts are being made to so increase the effectiveness of this atom bombardment that electrons may be removed from those of a given substance at will and that substances may be changed to others in the scale. The task is understood. Progress is being made. The goal may be reached at any time. When it is, then and there will have been accomplished the greatest feat in the history of chemistry.

The Eight Simple Rules of the "Health Game"

Uncle Sam Promises Stronger Children Through His New Plan in Schools

By H. O. BISHOP

THE United States Bureau of Education at Washington is introducing a new game into the public schools of the country.

It is called the "Health Game."

This common-sense innovation is spreading like wildfire in the localities that have thus far adopted the plan, and it is confidently believed that in only a few years it will be a definite and permanent feature everywhere, from the humble one-room little country school to the big city high school.

The "Health Game," as devised by the Bureau of Education, consists of eight simple rules, easily understood by any child, and thoroughly endorsed by the medical fraternity and all promoters of good health. These rules are:

1. A full bath more than once a week.
2. Brushing the teeth at least once every day.
3. Sleeping long hours with windows open.
4. Drinking as much milk as possible, but no coffee or tea.
5. Eating some vegetables or fruit every day.
6. Drinking at least four glasses of water a day.
7. Playing part of every day out-of-doors.
8. Complete digestion of food daily.

The "Health Game" is the combined production of Dr. W. S. Small and Miss Julia B. Tappan, the famous specialists in school hygiene attached to Bureau of Education of the United States. They have given the vital question of health among the school children of the country many years of study and observation and have conferred with leading authorities, both medical and educational, in every section of the country.

The "Health Game" does not consist of a dry and perfunctory reading of the eight rules by the teacher. Far from it! It is converted into a regular game, or contest, which seems to arouse as much interest and enthusiasm among the pupils as baseball, basketball, football, gymnastic exercises, marbles, leap-frog, drop-the-handkerchief, hide-and-go-seek, or any of the other numerous games in which boys and girls delight.

The first big surprise of the youngsters in their introduction to the "Health Game" occurs when they enter the school some morning and find a modern weighing machine on the platform in the vicinity of the teacher's desk. There always is a peculiar psychology about scales. Who is the person, young or old, who does not have a hankering to be weighed the moment he sees a weighing machine? The next surprise for the children consists of a large printed sheet of gray paper tacked on the wall near the scales. It is entitled, "Classroom Weight Record." This record provides a space for the names of the pupils, ages, height, normal weight, and actual weight each month during the school term. At the bottom of this chart are printed fascinating tables showing how much the average boy or girl ought to weigh at certain heights and ages; also tables showing about how many ounces the average boy or girl should gain each month.

The first time this chart is filled out, and at each subsequent monthly weighing, the interest manifested is amazing. Quite naturally, every youngster wants to weigh the normal amount. When the teacher announces to certain of the children that their weight is five or 10 pounds less than it ought to be, it is remarkable how eager they are to do whatever is necessary to catch up with the others. A heart-to-heart talk between teacher and pupil invariably brings out the fact that several of the eight rules of the "Health Game" are being neglected.

I asked Dr. Small if he did not consider health the most important feature of our public schools.

"It undoubtedly is," was his quick reply. "Health first in the schools, is the call which is heard with increasing frequency in every community that has been touched by the great American awakening to the value of health. The determination is widespread that the public schools of the country must never again in the future, as in the past, place book learning before physical fitness. Everywhere there is a demand for school teachers who know how to teach health.

"We have at last discovered that health, like happiness, is to a large extent a matter of habit, and that it can be taught. Our stereotyped aims and methods in the teaching of hygiene have to a large extent been discarded. The new aims are very definite, but our methods of attaining these aims are largely undeveloped. In health work in the schools every teacher must be a pioneer. There is a great responsibility and at the same time a great opportunity.

"Health must not be taught didactically, but by personal example and object lesson. The teaching of health, cannot be confined to any one lesson period, but can be introduced into almost every school day, from the kindergarten upward, for health inspection, the discussion of health problems, and for other health activities. In the lower grades this time should be devoted wholly to the promotion of health habits. It is the *what* rather than the *why* which should be impressed on the younger children. With the older children, the reasons for health rules take more prominence, and in the upper grades the habits which have been formed in the lower grades should be reinforced by accurate scientific knowledge. The material of instruction in hygiene should be taken from life; and textbook instruction, if any, should be merely incidental. In the upper grades the pupils should be interested in public health movements, and much information of personal value can be thus indirectly conveyed. For instance, in studying the phases of the campaign against tuberculosis, the pupil learns many facts about the disease and its prevention, with the advantage that his attention is directed outward and is not morbidly turned on himself.

"We now know that to obtain health we must earn it by obeying the laws of health. The most fundamental of these laws relates to cleanliness, within and without, proper diet, exercises, rest, and fresh air—in other words, the eight rules of the 'Health Game.' Obedience to these laws must be almost automatic in the child's life, so that he will be uncomfortable unless, for instance, his hands are clean, his food simple and wholesome—so that he will be uncomfortable in foul air, and automatically will seek fresh air and enjoy playing and sleeping in it.

"In the development of health habits, the first step is to make the child desire health, not necessarily for his own sake, but because it is an avenue to success and happiness in life. It is easy to illustrate from the lives of men successful in business and public life the value of a strong body in the attainment of success. Theodore Roosevelt, as most people know, began life with a weak body and developed systematically all of its possibilities for physical vigor. In the case of the girls, good looks are a great social asset, and every girl, as well as every boy, should be taught to value properly such signs of good health as bright eyes, rosy cheeks, a clear complexion, glossy hair, and an erect, confident carriage. We need to make pride in personal appearance respectable once more. We need to make our boys and girls feel something of the fineness of the old Greek ideal of a sound mind in a sound body. All children want to be popular with their mates, and they will readily see that the exuberant spirits which go with abounding health are a factor in popularity, and that there is a good reason for the old saying, 'Laugh and the world laughs with you,' while the 'grouch' is left to nurse his grievances in solitude. Every child in the public schools should be made to understand that his first and most important patriotic duty is to make and keep himself as strong and vigorous as possible, so that he may serve his country well in all walks of life.

"I feel absolutely certain that we will develop a healthier, happier, and better nation if every school in this fair land of ours will adopt the eight rules of the 'Health Game.'"

MISS JULIA B. TAPPAN and DR. W. S. SMALL, the famous specialists in school hygiene, attaches of the United States Board of Education.

PREPARED BY DR. THOMAS D. WOOD

most every study in the curriculum. It is often chiefly a matter of emphasis rather than formal instruction. The consideration of questions of diet, of ventilation, of the spread of transmissible disease, are all important, but it may be desirable to treat of them in connection with work in domestic science, in physics, or in nature study. History, civics, English and geography all offer opportunities for the inculcation of health lessons.

"A definite amount of time should be allowed

The Vatican, the World and Universal Peace

By A. R. PINCI

THE death of His Holiness, Benedict XV, has focused the attention of virtually the entire world toward Rome. The investiture of his successor is likewise of universal interest as a symbol of self-perpetuating power. Hundreds of millions of individuals, regardless of their physical distance from the Eternal City, are more or less familiar with what has happened at the Vatican within the last few weeks; probably more so than they are about more intimate affairs in their respective localities. What is the reason for that?

The best explanation is that made to me by the late James, Cardinal Gibbons. In a chat with him, when I obtained an interview, probably the last which he authorized under his name, he said:

"The Catholic Church is the oldest historical and continuous government of the earth."

This apparently simple declaration conceals, upon analysis, a portentous suggestion—a key, perhaps, to the solution of many inexplicable difficulties born of the late war, and that just now serve as subject matter of discussion and argument in the newspapers. During the late World War the Vatican followed a policy in the interest of universal peace that, in accordance with the fundamental precept of equality before God, could not be made elastic so as to serve those who wished to be selfishly served. Countless theories have been advanced as to why the Vatican did not vent its wrath upon this or that warring faction, and ludicrous attempts have been made to "prove" that it was influenced by consideration of self-interest.

He Regarded the Whole War as a Sin

NOW that Pope Benedict is dead—for it was this Pontiff that will be named in future historical annals of the war—I am at liberty to say what I learned in Rome shortly after the war ceased. His actions were in obedience to a spirit of impartiality, but the Pope never permitted himself to forget that a goodly number of Catholics were in the wrong as were those of other religious beliefs. Under the circumstances the Vatican had no choice but to regard the war as a collective sin. It had nothing in common with the prejudice that individuals of any one religion were any better, or any worse, in the aggregate, than their fellows.

As a graduate attorney, the Pope understood the dangers of attempting to set up the Vatican as a court, to discriminate against this or that group, this or that nation.

To understand the purposes of the Vatican in international questions, it should be remembered that the Vatican is really a government without a country. Its see is in Rome, but geographically and politically, it has no frontiers, no limits, and for this reason the Vatican is exposed to the blame for whatever act or word originates with one of its creatures, be it of the laity or of the clergy. The infamous deeds attributed to Von Gerlach, during the first years of the war, who was found by Italian courts contumaciously guilty of being a Teutonic spy while exercising his prerogatives of high prelate in the Pope's entourage, diminished the Vatican's influence in Italy. Gerlach's misdeeds are not yet a closed book, and though no different from the misdeeds accomplished by any number of professional politicians and diplomats to the same end, they rang more loudly through the world because of his relationship with the Vatican.

Possibly the Vatican's greatest and most radical step, under the pontificate of Benedict XV, was to urge Italian manhood to take part in politics. Generally speaking, the Italians, least susceptible to the Vatican among all Catholic peoples, at first regarded this as a quick means to restore its diminishing influence and thereby facilitate the possible restoration of temporal power, but the object was to undo what the allocution of Pope Pius IX in December, 1874, had caused, when he forbade priests meddling with politics. This inhibition, even though directed solely at the clergy, really prevented faithful Catholics from participating in politics at all, on the assumption that if the clergy would not be free to lead, those wishing to be led must logically withdraw. The net effect of this was that as soon as the patriots of the school of Mazzini and Cavour (who reflected the spirit of liberty of Washington and Jefferson) passed away, the country was left at the mercy of immature hands, some of which, without the moral restraint derived from religious motives, became professional politicians in all the name implies. The inhibition, moreover, was universal, and Catholics the world over refused to become identified with political movements of whatever character and scope.

Why He Turned to the United States

NOT everybody is aware that the Constitution of the United States contains no reference to God and makes no appeal to religion. Were, therefore, religious principles entirely ignored by its framers? Does the omission afford a just criterion of the religious character of the founders of the republic? Cardinal Gibbons assured me of the contrary.

"We should have no concern," he said, "to have the name of God imprinted in the Constitution—as certain religious sects have repeatedly tried to do—so long as the Constitution itself is interpreted by the light of Christian revelation. The Declaration of Independence acknowledges that the rights it proclaims come from God as the source of all government and authority."

Cardinal Gibbons was regarded in Rome as among the most conservative members of the Sacred College. Yet he was one of its most modern of spokesmen, and to this extent I believe that he identified, if not isolated, the spirit of today of the Vatican. This spirit is a far cry, it will be observed, from that evidenced by Boniface VIII, who in 1294 proclaimed that "God had set him over kings and kingdoms."

The interpretation stated about God and the Constitution indicates that the spirit of the Vatican today differs radically from that of yesteryear. Certainly Pope Benedict could not agree with several European statesmen that there was any godliness in their beliefs and actions, and that probably accounts for his turning to the United States, through his personal letter to President Wilson in 1916, in wishing to end the war.

The mere fact that a similar appeal 10 months before to the Austrian emperor, said to have been a devout Catholic, brought no encouraging reply, from the standpoint of humanity, is good proof, at this late day, that the Vatican did not dominate the dual empire, but on the other hand it proves that Austria-Hungary and its dynastic leaders were not above attempting to use the Vatican as a tool wherever and whenever possible. In fact, the Hapsburgs never hesitated to assure the Pontiff that they were ever ready to aid any movement to restore the temporal power to the Vatican, provided, of course, that the restoration would not cost them anything.

As to whether temporal power will be restored, no prediction can be made, but if that should happen, it will never be in Italy. The Italian people as a whole are not very religious. The Vatican realizes that the cradle of Christianity now ensconces millions that are at best prosaic Catholics. A movement to restore temporal power would probably fail as long as the Italian people are in their present skeptical mood. They have the greatest admiration for Catholics of foreign nationalities, but they are on guard against any pronounced revivals, such as that now being undertaken in France.

The Vatican's Dilemma

BUT the point is that any contradictory movement is open to suspicion. There are nations, or governments, to be more exact, that align themselves on the side of the Vatican and use it as a vehicle of unilateral statesmanship. The Catholic revival in France is looked upon with great suspicion by the Italian people, who see in it an opportunity for Quai d'Orsay to imitate Hapsburg tactics. It is within the memory of the majority that the Separation Law was effected in France. It is a matter of 15 years. Premier Briand gave the problem of "diplomatic relations" with the Vatican a political tinge when the Senate voted in his favor last December, notwithstanding some very evident dissatisfactions, due to secret understandings.

The Vatican's dilemma has been obvious. It could not reject French overtures, nor could it logically impugn the motive behind these overtures, especially since reports indicated a revival on the part of the people, perhaps due to the exalted emotionalism of the war period, coupled with the never-ending funeral, victory or other services.

The Italian people themselves, on the other hand, without questioning the merit of reawakened religious sensibility, are against political recognition of it by such an unrepresentative government as Briand's has been.

Not a little has been said about the possibility of a formal friendly understanding between the Vatican and the Italian Government. But for the fact that the Italians are very poor propagandists, because they do not understand publicity as publicity is understood in America, it could be said that the persistent publication of this bit of news might be due to some well-defined policy of one or the other camp. As it is, the most influential newspapers put the burden of proof on the Vatican.

To what is due this situation? Why is the Pontiff willing to isolate himself, physically, from the world? Who can deny the wonderful influence that a Pope would have if he, as a spiritual leader of people between the two poles and beneath the equator at every point, should go among them? Is it not probable that during the war if the Pope had suddenly appeared among any of warring factions, or in the capitals where statesmen machinated, he could have achieved that which he sought by means of correspondence?

This leads to a related conjecture. A native Roman propounded it: "It is conceivable that Pope Pius IX, who suffered the loss of temporal power, should have felt so profoundly about it as to virtually immolate himself, but is it possible that every succeeding Pope must feel the same way about it, merely because one set the example?"

He Must Follow Fixed Methods

TO THIS, the answer is an emphatic negative. It was gravely doubted if Cardinal Rampolla, considered the natural successor to Leo XIII, would have sacrificed his liberty to that extent. Pius X chafed under the restraint imposed upon him; his limited liberty was not voluntary, and it has even been asserted that he made some very strong representations against the policy, but to no avail. I myself asked Cardinal Merry del Val, then Papal Secretary of State, about the custom, but he offered no solution.

Benedict XV probably did not find the régime distasteful, because by nature he was studious, retiring, and thrived upon solitude. Four years of war at almost close range rendered his stay desirable from the standpoint of a spiritual observer. Yet, as already said, the condition seriously minimized the greatest opportunity available to the man whose position qualified him to offer his pacific services as the Chief Minister of Christianty. He was limited to words at a time when men believed not in words.

What of his successor? Will he, too, abjure the world? And if so, why?

It is utterly futile to speak of "liberal" or "illiberal" popes. Naturally, cardinals differ as to temperament, intention, and ecclesiastical interpretation. Yet the Vatican is a most complicated organization, and once elected, the Pope must follow the methods of the Curia. The Curia exercises its influence in many ways. Some times a vigorous prelate occupying the state chair under an easy-going pontiff may frustrate whatever progressive tendencies the latter may have, but, on the other hand, as in the case of Leo XIII and Cardinal Rampolla, two men of massive intellect met and conferred, with the Pope winning out.

One need but refer to the aftermath of Pius IX's accession to the throne of St. Peter. His choice was greeted by Romans with unbounded enthusiasm. At once he inaugurated a series of reforms, consonant, of course, with the times. Opposition was soon discernible; the *Setta Gregoriana* exerted every influence against him, until the determined Pontiff in self-defense formed a new council from the younger prelates.

Benedict's Death Means Delay

THE situation, however, is extremely delicate, and the death of Pope Benedict at a time when there was every tendency for a reconciliation with the Italian Government means a delay, even if his successor is minded to continue the indicated policy. But the greatest trouble is that just about the time that the Vatican had set its house in order, during the fifty-one years intervening since Rome became free, foreign intrigue, generally disguised as advanced diplomacy, should obstruct the delayed but none the less ideal steps of the Vatican toward brotherly peace within Italy.

For two years there have been rumors about the Vatican being invited to participate in the League of Nations. It was a disappointment to Vatican officials that a formal invitation to participate was never tendered. There are two sides to this question. The first is that the United States does not see its way clear to recognize the Vatican officially, for reasons that are obvious. The other is that it would not be possible to invite the Vatican to equal participation in any international agreement to which Italy is a party, until and after Italy and the Vatican have satisfactorily settled their own difficulties.

The death of the Pope at this time will naturally have a repercussion both in the limitation of armament agreement, so far as this has been developed, and the proposed Genoa conference, in both of which he was greatly interested. This influence, perhaps, was not directly traceable to the Vatican as it was to Benedict himself, whose conservative but cleverly progressive tendencies were thoroughly understood and appreciated by such a statesman as Mr. Lloyd George.

A Liberty Statue in Germany

The Bavarian Statue of Liberty at Munich, resembles our own statue of the Goddess of Liberty in New York Harbor. The American statue, however, is much taller than the German one.

Making the Soldier Bonus a State Investment

Wisconsin Paying Its Debt of Gratitude by Educational Plan

By BRUCE R. McCOY

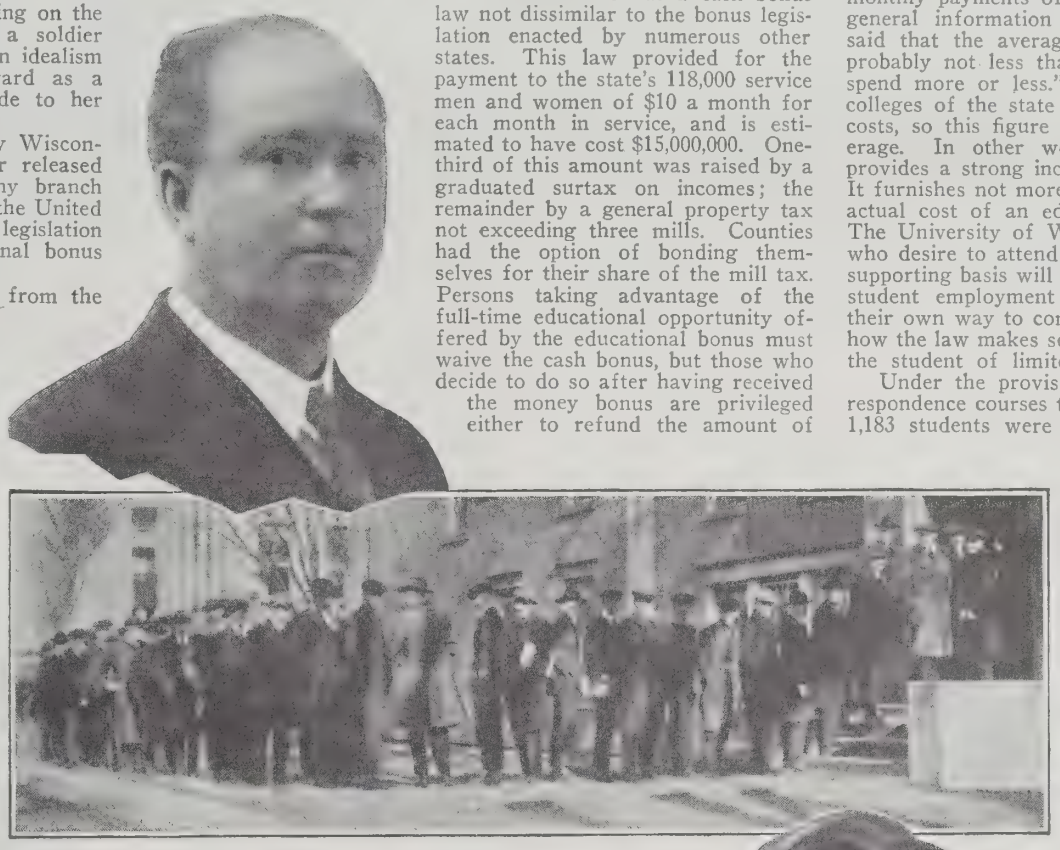
THE soldier bonus question as a national issue has developed into a discussion of national expediency. The division in Congress rests on the problem of how to provide funds necessary to put bonus legislation into effect. As to the actual form which national bonus legislation should take, there has been no pronounced difference of opinion.

Members of Congress are apparently in harmony on the conception of providing some sort of cash reward as an expression of the nation's gratitude to those who served the country in the World War.

While Congress wrangled over the financial obstacle blocking the path of a national money bonus, Wisconsin has placed on her statute books a piece of bonus legislation which goes deeper than the cash reward concept of national gratitude.

The Badger State is now entering on the third year of the operation of a soldier bonus law, which is conceived in an idealism not satisfied with a money reward as a recognition of the state's gratitude to her war veterans.

Educational opportunity to any Wisconsin man or woman discharged or released on honorable conditions from any branch of the military or naval service of the United States is the conception of bonus legislation embodied in Wisconsin's educational bonus law.



This law, called the Nye Act from the state senator who conceived and fathered the original bill, offers four kinds of educational opportunity to service men and women:

1. The state pays $30 a month to bonus students for each month in regular attendance at an educational institution for those who choose to take advantage of the full-time educational opportunity.

2. The state offers without cost to the bonus student the entire range of correspondence courses given by the Extension Division of the University of Wisconsin, in which more than 400 courses are available.

3. The state will provide for the organization of free evening class instruction in any locality of the state where there is adequate demand.

4. The state will provide for the establishment of special schools to meet the special needs of persons intending to take advantage of the educational opportunity.

Above—STATE SENATOR RAY J. NYE, of Superior, Wisconsin, who conceived and fathered Wisconsin's educational bonus law, the first law of its kind on record. Below—Group of war veterans attending the University of Wisconsin, Madison, Wisconsin, waiting in line to receive their monthly educational bonus payment of $30.

The Wisconsin law constitutes the most comprehensive piece of bonus legislation offering educational opportunity adopted by any of the states.

"The cash bonus did not satisfy the idealism of America or Wisconsin," explained Dr. Edward A. Fitzpatrick, who, as secretary and statistician of the State Board of Education, has been responsible for the administration and interpretation of Wisconsin's educational bonus law.

"The idea of giving the soldiers and sailors, as an expression of gratitude of the state, further educational opportunity is a conception worthy a democracy. It is in keeping with the great public service which these men rendered or were ready to render to this nation. And the state, in making such an offer to the soldier, is serving well its own purpose of promoting the common welfare. Nothing can improve the state more than a general increase in the intelligence and information of its citizenship. Such a result is to the state immediately and ultimately of greater value than any material advancement that could come to it.

"In the idea of an educational bonus for those who served the country during the recent war the interests of the individual and the state are one, and it is peculiarly fitting that the gift the state should give to these men is further educational opportunity."

Former Governor E. L. Philipp, who called a special session of the state legislature in 1919 to pass the Nye bill, characterized the educational bonus as "a gift that the soldier can neither lose nor squander; one that will be helpful to him during the remainder of his life."

Conceived and fathered by State Senator Ray J. Nye, of Superior, Wisconsin, the bill was passed by the legislature in the regular session of 1919, vetoed in its original form by the governor, and finally revised and enacted into law by a special session of the legislature in September, 1919.

The law embodies four essentials of bonus legislation:

1. The educational opportunity must be available—not merely potentially, but actually available—to all persons to whom the offer is made without reference to their educational preparation.

2. The educational opportunity must be of such a character as to meet the widely varied needs of the persons for whom it is intended and given at such times and for such periods as will make the opportunity actually available.

3. The legislation is designed as an expression of gratitude on the part of the state to those who served the nation directly in a military way—and all such should be included within the provision, particularly nurses.

4. There ought to be centralized and flexible administration of the law.

The State Board of Education is charged with the general administration of the law and is given plenary power to make rules and regulations to carry the law into effect. The law also creates an academic advisory board of five members to advise the State Board of Education on academic questions in connection with the administration of the educational bonus.

Wisconsin also has a cash bonus law not dissimilar to the bonus legislation enacted by numerous other states. This law provided for the payment to the state's 118,000 service men and women of $10 a month for each month in service, and is estimated to have cost $15,000,000. One-third of this amount was raised by a graduated surtax on incomes; the remainder by a general property tax not exceeding three mills. Counties had the option of bonding themselves for their share of the mill tax. Persons taking advantage of the full-time educational opportunity offered by the educational bonus must waive the cash bonus, but those who decide to do so after having received the money bonus are privileged either to refund the amount of their cash bonus or have it deducted from the sum due as an educational bonus.

The educational bonus law is effective till July 1, 1924. It is now well advanced in the third year of its operation. During the first year, the state paid $811,580 to former service men and women. This figure does not include the cost of free correspondence and evening class instruction. It is estimated that the entire cost of the educational bonus for the five years will amount to $5,000,000. The law provides for raising the money from two additional taxes: a tax not exceeding one mill on each dollar on the assessed valuation of the state to be levied annually for five years; a surtax on incomes in addition to the present normal tax to be levied for five years at graduated rates. Thus far the expenses of the plan have been met with revenue raised from the income surtax, and it seems possible that the state will find it unnecessary to resort to the property mill tax to finance the plan.

DR. EDWARD A. FITZPATRICK,

Secretary, Wisconsin State Board of Education, who has been responsible for the administration and interpretation of the educational bonus law.

The results accomplished thus far by the educational bonus are best shown by statistics of the educational bonus administration. Figures are given here for three years, although the third year is not yet complete and its statistics will be subject to revision later.

Under the full-time educational provision of the law, which gives the bonus student $30 a month while in regular attendance at an educational institution, the State Board of Education has made a total of 14,992 assignments—5,386 during the first year, 5,167 the second year, and 4,439 thus far in the third year. These figures include assignments to both regular and summer sessions and naturally would include some duplications in the case of individual students attending more than one year. Of the total assignments in three years, 13,383, or almost 90 per cent, have been made to 218 state institutions; including 11 universities and colleges, nine state normal schools, 132 high schools, nine vocational schools, six grade schools, 10 county agricultural and training schools, and 41 other institutions, such as military, business and religious educational institutions. Sixteen hundred and nine assignments have been made to out-of-state institutions. Curiously enough, the number of out-of-state institutions to which bonus students have been assigned is the same as the number of state institutions, 218.

The list of institutions to which bonus students have been assigned furnishes an interesting commentary on the kind of education which is demanded by former service men and women. Wisconsin bonus students in various specialist schools and colleges in and out of Wisconsin are studying everything from theology, evangelism, music, osteopathy, orthodontia and naprapathy, to ladies' and gentlemen's designing, watchmaking, chiropody, aviation, veterinary science and barbering.

Assignments have been made to schools and colleges in a majority of the states of the country. Wisconsin bonus students are now or have been in attendance at three different universities in France, two in England, one in Norway, one in Belgium, and one in Japan.

The student taking advantage of the full-time educational opportunity receives about $270 a year in nine monthly payments of $30 each. The latest bulletin of general information of the University of Wisconsin said that the average expense of the school year is probably not less than $575, "although many students spend more or less." The tuition charged by private colleges of the state is partially offset by lower living costs, so this figure probably approximates a fair average. In other words, the educational bonus law provides a strong incentive, not a gratuitous education. It furnishes not more than one-third to one-half of the actual cost of an education in Wisconsin institutions. The University of Wisconsin advertises that "students who desire to attend the university on a partially self-supporting basis will find it possible," and the university student employment bureau advises students earning their own way to come with at least $250. This shows how the law makes self-support possible and encourages the student of limited financial means.

Under the provision of the law offering free correspondence courses to former service men and women, 1,183 students were assigned during the first year to courses given by the Extension Division of the University of Wisconsin. Of this number, 1,072 actually began work and completed 6,445 lessons. During the second year, 1,338 students were assigned to correspondence work; 1,287 actually began work and completed 9,415 lessons. The subjects covered everything from commercial correspondence, contracts, industrial management and marketing problems, to carpenters' and printers' arithmetic, a practical course in concrete, medieval history, pharmacy and practical sociology.

Many students taking advantage of free correspondence work have done so to occupy their time during a period of unemployment and have dropped the work as soon as they obtained a job. This fact explains in part the variation in the number who were assigned and the number who actually began work.

Under the provision of the law for the organization of free evening class instruction, the State Board of Education has organized special classes in various cities of the state in accounting, law, corporate organization, shop mathematics, and shop drawing. A recent interesting development of this feature of the law has been the organization of bands in several localities of the state to provide free instruction in music.

To meet a special demand for engineering and commercial work, there was organized in Milwaukee a special branch of the University of Wisconsin.

Eighty students were assigned during the first year of this special school to attend regular day classes in engineering and commerce. The net cost of the administration of this school during the first year, exclusive of the sum paid as an educational bonus to the students, was $8,917.77.

While the law necessarily imposed certain exceptions and restrictions for the protection of the state, the legislature intended that it should be liberally construed. To qualify for the educational bonus in any of its forms, for example, applicants must have been bona fide residents of Wisconsin at the time of enlistment, must have served in the army or navy of the United States for at least 90 days, and must have been honorably discharged, released or furloughed.

A few examples illustrating the liberal construction of the law are pointed out by Dr. Fitzpatrick as follows:

A student who, just before the war, was attending a college outside the state and desired to resume his studies in that college, was permitted to do so. Graduate students in out-of-state institutions who had well-advanced research work under way were permitted to continue their work. Many young men who had been injured in the war wanted to attend school, but because of their injury could not carry even the liberal requirement stated in the rule for minimum attendance. For such persons, a rule was made admitting a reduced program as full-time attendance.

How Wall Street "Milked" One Railroad

The Story of the "Katy" and the Millions Its Investors Lost

By CHARLES ALBERT COLLMAN

THE average stranger, sauntering through the financial district of New York, with but a hearsay knowledge of its life and doings, is generally intimidated by outward impressions. The effect of its huge structures is undoubtedly overpowering. The Bankers' Trust Building—what a stupendous pile! What an oppressive sense of marbled splendor in the wide, unfrequented halls of the Mutual Life Building! What stately majesty in the long, frowning colonnade of the National City Bank!

Instinctively the thought arises that here, behind these walls of granite, marble and limestone, the profoundest problems of our economic life are being grappled with and solved. For here at work are the masters of American finance, the men "who live in a higher sphere," to use the words of a Wall Street corporation lawyer, who spoke in defense of the greatest railroad financier of his time.

But there are certain haunts in that same district, where one may find congregated the old veterans of the Street, the "Shadows," the "Ghosts," the men who barely survived or were broken in its savage struggles. And these men will tell you that in New York finance there is no cogitation of weighty problems, and that its operations are simple as a child's game. A game such as boys play, grown-up boys, it is true, and mighty ones, trained in skill and cunning, playing with all the selfishness, indifference and thoughtlessness of boyhood.

This article is intended to describe one of these financial plays—one of which the Street knows very little, and the country nothing at all. In Wall Street, this game is known as "milking a railroad dry."

Road Soon Hit Financial Rocks

SOME years ago, two powerful Wall Street financiers, each of them the head of a great banking institution, acquired, with their associates, control of a railway. These two men were not novices in the financial management of railroads. Each was backed with a wealth of experience in this particular pursuit. The road they had bought had been built up and carefully managed over a long period of years by John D. Rockefeller and William Rockefeller. Annually it earned a large surplus over all expenses and charges, and this net surplus in its treasury at times amounted to many millions.

The road, with its splendid record of earnings and its uninterrupted profits, enjoyed the public confidence as an investment property. Its securities were regarded as gilt-edged. It was, therefore, in excellent condition to be exploited.

To carry on the plans they had formulated, the two financiers of whom I speak, elected themselves, or their representatives, to the executive committee of the board of directors of the company. By this action they made themselves managing directors. And every step that was taken in the operations which I am about to describe, was authorized by these two men.

A fine, solvent railroad was now to be made a football in the hands of a financial group. The financiers announced that they were about to inaugurate "a conservative and protective development and extension" of the company's lines.

Those who have gained costly experience by placing their money in similar ventures, may well shudder at the cynicism of this well-known financial phrase.

Less than five years later, the two bankers *quietly and without public announcement, resigned* from the management of the property.

Twelve months afterward, it was suddenly and officially made known that the railway company was bankrupt, its empty treasury facing a deficit of millions, while its securities to the amount of nearly $250,000,000 were in the hands of the public or in the vaults of great life insurance companies, a large part of them worthless, or with principal and interest overdue and unpaid.

Wall Street Never Pays for Its Wrecks

WHAT had happened to the splendid property in this short space of years? Why had the two men deserted it? How had all this come about? To date it has remained a mystery. It is the province of this story to disclose the facts.

It may be said at this juncture, however, that for six long years the railroad lay bankrupt, its bills and obligations unpaid. A short time ago, or to be more exact, on November 22, 1921, two large Jewish banking houses in Wall Street announced that they had developed a plan for the "financial reorganization" of the company. This plan consists in the proposed assessment of the impoverished stockholders to the tune of $18,420,000. For you see, Wall Street financiers themselves never pay the bills of properties that crumble to pieces under their hands.

In previous years, men and women had been induced, by plausible publicity, to invest their savings in the $76,000,000 worth of the stock of the company. These shares, with an original face value of $100 each, are at the present writing being footballed among the brokers of the New York Stock Exchange at a price of $1 and $2 each for an engraved stock certificate.

Today American investors are asked to pay for the follies of the old banking management whose policy wrecked the road. In this country, the story of the public investment in railroad and industrial stocks is one of the most disheartening on record. For years the people have been deluded with the notion that if they buy such stocks, they can rest in idleness, while the real workers of the land will toil and make them rich. But a new era has dawned in the management of public corporations, bearing with it the promise of a cure for this delusion.

Twenty years ago, a small railroad, little more than 2,000 miles in extent, traversed a territory in the Southwest, from Kansas City and St. Louis on the north, down to Galveston. It carried the wheat, lumber, oil and cotton of the West down to the Gulf of Mexico. And since it traveled through three large states, it was named the Missouri, Kansas & Texas Railroad, more popularly and for the sake of abbreviation, known as the "Katy." In Missouri its lines were fed by Hannibal, St. Louis, Kansas City; and in Kansas it touched Junction City and Parsons. It cut south through Oklahoma into the great state of Texas, on its way touching Denison, Dallas, Waco, Houston and Galveston.

The small line had grown up in successive years, with varying fortunes from a 300-mile fragment, known in 1872 as the Southern Branch of the Union Pacific Railway. It had waxed, until, as I say, some 20 years ago, it was a line of 2,197 miles in extent, owned by the two leading members of the Rockefeller family, who had gained ownership five years before. At this period its gross earnings aggregated $12,000,000, and after payment of the expenses of operation, there was left $4,000,000 to devote to interest and sinking fund charges, leaving as a rule a surplus over all charges and expenses of some $500,000.

For 10 years the railway was nursed quietly into a larger existence, the surplus funds being placed back into the property, so that few new bond issues were needed for financing its requirements. The company became entirely free from floating debt. Not once in all its years had it incurred a deficit. Indeed, its surplus in 1903 amounted to $1,099,916; in 1905 to $1,267,190; in 1907 it reached the large figure of $3,682,311.

The Katy by this time had sent its arms out in all directions. It had reached Joplin, Missouri; Shreveport, in Louisiana, and had extended to Wichita Falls and San Antonio, Texas, on the West. It had gained a rail length of more than 3,000 miles, and its gross earnings had doubled.

In other words, the railway was developing along natural, healthy lines. Wall Street, that narrow, cavernous thoroughfare, thousands of miles away, where men gambled on prospects and the work of others, was scarcely a factor in its entity. The Katy was serving its territory, and growing with its growth.

But events important to the small line's destiny were impending now. The Rockefellers had disposed of their interests and retired from the board.

Hiding Debts to Fool Investors

THERE was in Wall Street at this time a railway financier, who, because of his cold-blooded characteristics and lack of scruples, was known as "The Man of Ice." He was then owner of the Minneapolis & St. Louis and Iowa Central systems, and for many years he had been identified with Western railway lines, which he and his associates had acquired, not for the purpose of serving the public, but to make money for themselves.

The covetous eyes of this financier became centered upon the Katy. He observed its steady growth and its prosperity. Now that the interests that had built it up had left the board, he saw an opportunity for a profitable "deal." Such deals of his and his partners had often been financed by the head of a large Jewish private banking house in New York and he interested this banker in the project.

In 1909 came the announcement that stock control of the Katy had been obtained by a financial group, headed by The Man of Ice and his Jewish associate. The Katy was now in control of a proverbial Wall Street "ring." The "ring" had merely bought a majority of the stock. That enabled its members to do whatever they wished with the Katy. They elected themselves to the directorate, and took control.

Immediately the conservative policy that had built up the railway property was overturned. The treasury that had accumulated many millions was swiftly emptied. The surplus that had accumulated in the Katy since 1906, amounted to $7,980,000. This sum was at once expended on "improvements and betterments," including several other items. The surplus was in the treasury in the form of bonds. *The banking house to which these bonds were sold obtained the enormous amount of $1,389,400 in the form of discounts and commissions.*

The "conservative and protective development" which was heralded by the new directors consisted in the purchase by these financiers of numerous terminal and subsidiary railroad properties, which were attached to the main systems of the Katy. These properties were bought at high prices, and their first mortgage bonds were guaranteed, principal and interest, by the Katy.

I shall give one example of the caliber of the properties which were thus loaded upon the Katy by the "ring." This was a small railroad line, entitled the Houston & Brazos Valley road, which had been bankrupt for five years. It had failed to meet its fixed charges in the year 1908 by $1,512. In 1912, this deficit had increased to $21,891. This line was bought in 1913, in which year its deficit jumped to $27,806. In the year following its purchase, the deficit was $82,286. The little property was bankrupt before its purchase by the "ring," and it has been bankrupt ever since.

At this very time, there were outstanding, in the hands of individuals, who had trustingly invested their savings, and in the vaults of savings banks and insurance companies, which handle the savings of the people, $250,000,000 of this railroad's stocks, bonds and notes.

Our highest law designates the directors of a railroad company the "trustees" of its security-holders!

In loading new properties of this kind upon the Katy, the financial "ring" made the mileage greater and increased the gross earnings. The Katy was thus made to appear to be expanding at a rapid rate. But the huge debt that was being piled up in the background was kept invisible.

Now the opportunities for financing were ripe. *"Financing" means the creation of a large debt through the sale of bonds and notes to the investment public.* It is in this wise that financiers make their profits, and it was for this reason that the group in question had bought the Katy.

But these experienced men did not issue one large mortgage bond to finance their purchases. There would have been but small profit to them in that. They adopted a new and dangerous form of financing. They made, over a series of five years, a long list of bank loans and short-term note loans, which were renewed from year to year, thus having the advantage of generous discounts and commissions on each of the many transactions.

How the "Ring" Piled Up Huge Debts

IT IS a peculiar fact in Wall Street's finance, that whenever a railroad debt becomes due, it is paid for by making a much larger loan. In few instances that have ever come under my observation, have loans been met with smaller loans, the balance being paid from the net profits of the company. *Wall Street's theory is that no corporation should ever pay a debt.* Thus funded debts accumulate, roll up into vast sums, until in a trying moment in the corporation's life, the obligations cannot be paid. Then bankruptcy ensues, which means that the persons who have invested in the securities of the company lose a portion of or all of their money. *But Wall Street never loses.* It has obtained its discounts and made its commissions, and its duties have ended by loading the burden of obligations upon the public. We shall see that this method was religiously followed in the financial program of the Katy "ring."

When the "ring" bought the first terminal property and loaded it upon the Katy in the year 1909, these gentlemen contracted a loan for six months with a banking house, for $2,000,000. At the end of the half-year period, this loan was met with another loan for three months, amounting to $3,600,000.

Thus, in 1909, two bank loans were made, amounting to a total of $5,600,000. When these matured in 1910, they were met with a one-year note loan of $10,000,000. This was met in the following year by a two-year loan of $12,850,000. In 1912, this loan amounted to $17,500,000. In 1913, the loan had assumed the huge amount of $19,000,000.

So, from the original loan of $2,000,000 contracted by the directors in 1909, we see in 1913 a debt rolled up into $19,000,000. What had the Katy to show for this debt? A terminal property or so, and a few minor payments made on its equipment.

This transaction is made clearer in the following table:

1909—$2,000,000 loan for six months $3,600,000 loan for three months	$ 5,600,000
1910—$10,000,000 one-year notes to provide for above 1909 indebtedness	10,000,000
1911—$12,850,000 two-year notes to provide for above 1910 indebtedness	12,850,000
1912—$3,150,000 additional two-year notes bringing this issue to amount of $1,500,000 additional one-year notes bringing maturing indebtedness by May 1, 1913, to	16,000,000 17,500,000
1913—$19,000,000 two-year notes to provide for above 1912 indebtedness	19,000,000

Other Lines Wrecked the Same Way

"BUT," I hear a reader exclaim, "you are unjust to the Street. You are citing an exceptional case—a line in the hands of a group of railroad wreckers."

To which I am constrained to respond: On the contrary, these are the traditional methods of Wall Street finance. Operations such as these wrecked the Rock Island. Financing of this sort brought the New Haven Railroad to an evil pass. It was through this program of conservative expansion that the old Hollins Syndicate inflated the C. H. & D. bubble, and burst it.

To be sure, The Man of Ice and his associates represented a group of railroad gamblers. But allied with them, and dominating the board of the Katy as managing directors, were two powerful bankers of Wall Street.

The most prominent of these was a partner in the large international banking house—a man of alien race and foreign nationality—which was foremost in financing the Katy.

The next in importance was the president of a leading Wall Street trust company on whose board the international banker was a director.

The transactions as above outlined, and others that shall follow, were authorized by the member of the alien international banking house and the president of the trust company.

He Taught Himself Thirty Languages

By WILLIAM ATHERTON DU PUY

(C) Clinedinst

WILFRED STEVENS,

State Department translator, who knows thirty languages.

WILFRED STEVENS is translator for the State Department and knows nearly all the languages of the world—Chinese, Sanscrit, Hungarian, Russian, Swedish, Turkish and everything.

Of course, he does not literally know all the languages, but he knows all those that are likely to be often needed in the relations of this government with its fellows. He reads, writes, translates 30 languages. There remain few languages of importance that he does not know, save those of India, in which America has little interest.

The acquisition of these languages is as remarkable a mental feat as one is likely to observe in a decade. One encounters an individual here and there who knows a half dozen, 10, even 20 languages, but I have never before met a man who was master of 30, nor have I ever heard of such a man. And then Mr. Stevens has a peculiar interest, because he is by way of standing between us, a one-language people, and the rest of the world in our official relations.

Those linguists one usually meets have sprung up from Central Europe, where they have begun by acquiring a number of tongues in the days of their childhood, mingling with polyglot peoples. If the parents of a developing child should make three or four moves about Europe during his upbringing he might unconsciously absorb half a score of languages.

But this man Stevens was born and raised right here in the United States, of old-time American stock. He has never been abroad. He never studied a language in school. He did not even have a foundation of Latin or Greek. All his languages have been acquired in the United States and through his own initiative. His contact with the spoken word has been but occasional as he was able to get in touch with the incidental foreigners who dwell among us.

He Learns German and French

I WENT to see this man of many tongues over at the State Department. Up near the roof, under the eaves, in a cramped little office, surrounded by innumerable dictionaries of many languages, sits the official translator of Uncle Sam's foreign office. I asked him how a man proceeded with the task of acquiring and filing away in his mind the limitless detail of languages.

Mr. Stevens told me that when he was a boy his father was the publisher of a little weekly paper in a town in Minnesota. His father and mother were both of English descent and neither knew any foreign language. The first interest which he remembers in speaking other than English lay in the satisfaction he obtained by talking "hog latin," or in otherwise devising a manner of speech which could be understood by one of his associates, but which would mystify the others. A little later he found that some members of the community in which he lived spoke German and that if he knew this language he and the German boys would be able to confound the rest of their playmates.

It was to accomplish this purpose that he first began studying German. Once started, the acquisition of this language fascinated him and he worked on it most industriously. There were German newspapers printed in Minnesota and these he read regularly. There were many Germans living in his village, but they were mostly prejudiced against speaking their native tongue. However, when they discovered the boy's earnestness to learn it they were ready to help him. In three or four years he had an easy speaking and reading knowledge of German.

In Minnesota also there were a good many French people who had drifted over from Canada. Having mastered the German, Stevens, while still a boy, became curious to know how it was that these Frenchmen managed to express themselves and he began to talk with them. He says it has always been true that when he started on a language he was consumed with such a desire to master it that he worked on it long hours, day or night. He did this with his French. So it came to pass that when this American lad arrived at the age of maturity and became a printer in his father's shop, he was, despite the fact that he had never studied them in any school, the master of two languages other than his own.

Thus equipped, Wilfred Stevens came as a young man down to Washington and obtained a place as typesetter in the government printing office. There his knowledge of two languages other than English was soon discovered and he became a proof reader on manuscripts which required knowledge of these languages. He still regarded his knowledge of these languages as a mere incident, however, and had no scheme for other linguistic study until one day another printer told him that interest was increasing in Spanish and that he should acquire that language also. On this suggestion of an associate he began the study of Spanish and was progressing toward its mastery when he ran on an advertisement inserted by the War Department for a translator of German, French and Spanish. He took this examination, passed it, and thus, nearly 30 years ago, became a linguist by profession.

For four years this young man worked as translator for the War Department. At the end of that four years he took an examination for the position which he now holds as translator for the State Department, and in that examination succeeded in demonstrating his ability to put nine European languages into English. Thus was it shown that in the four years during which he worked for the War Department he had acquired six languages besides those he had known when he went to work for that department. These languages were Portuguese, Italian, Russian, Dutch, Swedish and Norwegian.

Study of Arabic Rests His Mind

ONE after another of these by dint of unending toil he had been able to file away in its particular pigeonhole of the mind.

When Mr. Stevens had learned a dozen European languages he began to feel that the task he was placing on his mind was becoming a bit weighty and to wonder how long his ability to acquire tongues would continue. It was at about this time that the translation of Arabic, that language which is the basis of most of the tongues in Western Asia, was put up to him. In his study of Arabic he found that it was the written character which he must learn and that the task was largely visual. His mind had to remember how a character looked rather than its spelling or pronunciation. The task was different from that of the other languages. It proved a rest to his tired brain and the study of it became a sort of relaxation. Arabic, however, presented an unusual complication, for Mr. Stevens found that its dictionaries were based almost exclusively on one piece of literature, "The Arabian Knights." One could readily find synonyms for those words which appeared in that classic, but when he undertook to translate from the Arabic subjects which required different terms there was little help available in dictionaries extant.

As he went along Mr. Stevens made extensive additions to his translators' dictionaries. His Arabic dictionary, for example, is very full of marginal entries, in an infinitely fine hand, of words which did not appear in it. This is true of one and another of the languages which he has studied, and the publishers of these dictionaries may greatly improve them when new editions come out if they learn of these marginal entries made in an attic of the State Department and include them.

It was at about this time that Mr. Stevens undertook the greatest task of them all, the mastery of Chinese. Chinese was likewise a visual language, and the signs which represented its syllables and words had primarily to be learned by sight. Chinese is, of course, the language of them all which requires most detailed study in its acquisition. Every word in the language is a picture and one must learn the meaning of that picture and retain it and be able to fit it into its combination when it recurs in his reading. Thus, where English has its 26 characters, Chinese has its tens of thousands, and the educated Chinese himself never learns them all.

Day and night for years did this translator, with all the intensity of a sportsman in pursuit of a new creature of the wilds, stalk through the preserves of Chinese literature and bag an ever-increasing appreciation of the meaning of that oriental language so different in form and so different in fundamental thought from any of those of the West.

On a knowledge of Chinese he built an understanding of Japanese, for, it must be remembered, the latter people were entirely illiterate until they came into contact with the Chinese and from them borrowed the fundamental principles of a written language. The State Department is now able, through its translator, to get offhand at the meaning of any message in either of these oriental languages.

Hungarian the Most Difficult

WITH the increase of emigration from Europe, with the development of intimate relations with different peoples of the world, the need of the State Department for knowledge of one language after another has developed. Some years ago, for example, there grew to be a considerable need for translations from the Hungarian and the department's language expert undertook a mastery of that language. He is authority for the statement that Hungarian is the most difficult language in Europe to learn.

Most of those new countries which have evolved in Eastern Europe since the war have Slavonic languages closely related to the Russian, which Mr. Stevens reads very readily. He has been able, therefore, to acquire an ability to translate the communications of these new countries. But one of them has required special study and so the language which he has most recently learned has been that of Lithuania which, strangely, is the language in the world today which is most closely related to ancient Sanscrit, which formed the principal basis on which nearly all the languages in the West were built. This State Department interpreter had long ago mastered Sanscrit, and to him has been revealed a world of interest in tracing the striking relationships between modern Lithuanian and ancient Sanscrit.

Mr. Stevens does not, because he has acquired so many languages, depreciate the difficulty of learning even one of them. To master a single language, like French, for example, which he says, is the prettiest of languages and among the easiest, is a stupendous task. To thoroughly learn Hungarian is almost impossible.

He Has a New Language All Prepared

ON THE basis of the infinite study that he has given to the language of the world, this translator of our State Department has built a new plan of language; has, in fact, developed an independent language which he hopes to give to the world. Tediously through many nights of the past decade he has labored on the vocabulary of this language. It is built on the principle that language should be founded on root words, which are of but one syllable and each of which has a very definite and unchanging meaning. From all the languages he knows he has sought out such monosyllabic words and has set them down and defined them. Thus from all languages he has built up a common language, which he regards as being superior to them all. Expression in this language results from combinations of these root words. It requires but half the space of English, which is probably the briefest of all languages of the world. The manuscript dictionary which lays the basis of this language by this master is written. So sensitive is he about it that he refuses to allow it to be published while he is living. Out of his modest salary, for the government pays this man of many tongues but $2,100 a year, less than it pays proof readers, from whose ranks he was recruited 30 years ago, he has set aside a fund which guarantees the publication of his dictionary after he is dead. Thus does he protect himself against the possibility of having his work uncharitably received and against the annoyance of being lionized should it prove an immediate success.

His Highness the Carp Evicts Native Fish

Rough Foreigner That Usurps Our Beautiful Lakes and Rivers

IN COMMON with other things American, the true, gamey, native American fish are being crowded out of American waters. The invader and supplanter is the carp. It is now one of the most common fish in American lakes and rivers. It is steadily usurping all the fishing grounds and in a comparatively brief time the native American species, the finest fish in the world, will be a thing of the past.

The carp question has a commercial and racial side which prevents suitable action for the defense of American fish. The carp is a favorite of certain communities where large quantities are consumed, and defenders of American fish against this invader have been amazed to discover that they are not dealing with a fish question at all, but a racial question, full of danger points and fraught with animosity.

THE carp is generally known as the "German carp," and has been regarded as a native of Europe and of Germany especially. This, however, is not true. The carp is really a native of China where it is found in profusion. Three hundred years ago it was first brought to Germany and there reared in ponds. Hence it gained the name of German carp, which it retains in this country.

That the carp should have been introduced into this country is a marvel, for there was absolutely no necessity for bringing it here. Our waters at the time of its introduction were teeming with fish of all sorts and varieties. However, foresight was lacking and so the fish was wished upon us like the English sparrow, the Norway rat, the Johnson grass and the Hessian fly. The first specimens of the carp are said to have been brought into this country by Robert A. Poppy in the year 1873. There are those who aver that the first carp were brought to America from France in 1831 by Henry Robinson, of Newburgh, Orange County, New York, and that they were planted in the Hudson River and flourished there. At any event, they were introduced; and then the fun began. In 1875 the Fish Commission of the United States undertook the propagation of the carp. The spawn was distributed free to all comers. It was not long before a carp craze swept the country. This miserable foreigner fish would thrive in the most disgusting sewer hole. If a farmer had a reeking mud-sink in his back yard, or if he had a duck pond filled with drainage he conceived the bright idea of planting it to carp. Every available ditch was stocked. In the prairie country the carp met with wide acclaim and lakes and streams that had never known fish life of any great value were planted. By the year 1885 the streams of very nearly the whole Pacific Coast of the United States were stocked and later overrun with carp. To say that today the carp owns the waters of the United States is to say the very least. A female carp of about seventeen pounds may carry as high as 2,000,000 eggs. David Starr Jordan states that something like 700,000 eggs have been taken from one of this species. A five-pound carp will produce about 60,000 eggs. In the face of this stupendous increase going on unabated it is a wonder that our native fish life has not entirely been wiped out of existence; but that it is speedily passing, all anglers know to their sorrow.

Nothing is done for the reason that "rough fish" give impetus to our internal commercial fisheries; the control of many of these fisheries being distinctly of a racial character. Only certain people eat such fish as the carp, the sucker and the red horse, indeed they esteem them as delicacies. Anyone visiting the fish markets in the East Side of New York City knows this. To see the hundreds of thousands of carp there being handled and absorbed daily is to realize more fully the meaning of it all. Carp and other rough fish are to certain types of people as dear as life itself. We are giving over our beautiful waters, permitting these crude fish to inhabit them and destroy all precious life in them to satisfy a crude foreign taste, not one of a thousand Americans ever touching a carp as food. This is a concrete fact.

Finds Big Market in the East

THREE varieties of carp are found in this country, the most common being the so-called *scale-carp* whose body is thickly covered with large scales. The *leather-carp* is almost devoid of scales. The third variety is the *mirror-carp,* which may be told from the others by the presence of some three or four rows of scales in the neighborhood of its lateral line. The mirror carp goes the highest in weight and will attain 50 pounds or more. Warm, stagnant ponds often produce gigantic specimens of this fish.

Suckers, red horse and buffalo fish are native to our waters. These three, including as a fourth, the carp, constitute the lower element of our finny life—the Bowery toughs, so to speak. The carp of the Mississippi River, on its upper waters, is given a special and prominent name by East Siders, being known as the Mississippi "sweet fish." Intense seining operations are carried on along the Mississippi River between Winona and St. Paul; "sweet fish" are there in abundance. Probably it is the refuse from the great cities on the river that make for the particular "sweetness" of this choice delicacy of the deep; nevertheless it forms an industry that as to commercial importance cannot be belittled. An idea of how vast are the numbers of the carp and how great is the market in the East may be gathered from the following: The fish that are captured also include various game fish, but these are thrown back in the water, only the rough fish kept. The rough fish are loaded into refrigerator cars, 50,000 pounds to a car, and often as high as five cars are made up, totaling 250,000 pounds, which make their way over the rails to the big cities, where they pass through various hands, finally reaching the stalls in the fish markets where they are purchased by consumers. The fish are packed in the cars in an uncleaned condition. Many cars are especially equipped with tanks of water and the fish are kept alive in these; indeed, they are often sold alive in the East Side markets.

The seining of the rough fish from the Mississippi and other muddy rivers is good work and no fault is to be found with it. But the fact that the carp is found now in all clear water lakes gives another angle to the matter. Lakes, too, are profitable fields for commercial enterprise in rough fish and are being given over to this more freely than ever before. This means but one thing—the elimination of our choice native fish as factors of importance. In the past, hundreds of thousands of anglers have annually gone to the clear water lakes, but today some of the once famous fishing lakes see but a handful of boats on the face of the waters.

Protests Are Ignored

OUR lakes in the respect of fish and fishing are blessed heritages not to be wantonly desecrated; but they have been desecrated; *our waters are now practically free of choice fish life.* The rough fish, such as carp, suckers, buffalo and red horse, are increasing prodigiously and the fish and game commissions of the various states apparently cannot be moved to attempt the netting of them to spare the better fish, although letters pour into the offices of these officials clamoring that it be done. These letters are not answered. If they are answered the main thread of the protest is skillfully evaded, a promise indirectly being made that the condition is to be "looked into."

A written protest against the condition of rough fish in those waters where they should not be permitted has been turned down by newspapers in two states. The question is a bothersome one. It should not be. The fish can be removed from the lakes by simply running a net through them in the practical and efficient manner of which the seiners make use. But the feeling is apparent that the better fish do not count, for they do not represent ready money; the rough fish represent money and therefore are permitted to increase so that when a netting is made the haul will be one entirely satisfactory from the speculator's point of view. Our commercial fisheries are important, *but there are waters restricted for such fishing and these waters should be the legitimate grounds for the industry.* Reference is here made to rivers of a muddy nature, of waters which are not fitted for the gamier native fish. Utter harm has been brought about by the overrunning of the beautiful lakes by the rough fish which goes on unabated *and without anything being done about it.*

Fine Fish Driven Out by Carp

IN STATES such as Minnesota, Wisconsin and Michigan, once the home of some of the finest fish that abide in the waters of North America, the better fish are vanishing. The rough fish have taken possession; have destroyed the better fish *by destroying the spawn cast on the spawning grounds.* Canada has more wisely met this problem by taking the utmost care of the waters and keeping control of the rough fish so that they constitute no harm to the better grade of fish. This represents to Canada annually a vacation and resort business going into millions of dollars. Canada will become the playground of American outers simply because our waters have been almost completely turned over to the organized rough fish men, controlled as they are by one class.

Everything is being done to protect the rough fish; the native game fish are gently pushed into the background. An official of the Fish and Game Commission of Wisconsin stated quite frankly that the rough fish represented money value and that the game fish had only a sentimental value. An examination of the fish laws of Wisconsin will show that the rough fish are protected with greater care than the game fish. It has come to pass that the slimy sucker fish has attained such importance that Wisconsin will not permit you to have in your possession at any time *a sucker under nine inches in length!* To the average man this may seem as nothing; to the man who knows fish this will seem ghastly.

When the anglers and people who love our waters come into full possession of the facts they will swing into action. Our beautiful lakes, once teeming with noble game fish, have passed into alien hands for exploitation. It is a part of the re-Americanization of America that our native fish be given a chance for life.

Industry Halts At Bankers Command—By FREDERICK R. BURCH

NO ONE knows better than the bankers that the banking system is in complete command of the industrial world. There are some people who realize that this all-controlling power is unfounded. Like the hitherto accepted doctrine of the divine right of kings, when sifted to the foundation, it is found to rest upon sand.

Civilization, among other things, consists of a ready and easy method of exchanging credits. This is accomplished by the use of money, a medium of exchange.

No money, no exchange. No exchange, no business. No business, no employment.

The idea that money is a commodity that can be owned and manipulated, as such, by private individuals, brings the control thereof into the hands of the privately managed banking system. The banks are thus using a public function as private property and, at will, harassing and destroying industry and unexpectedly throwing people out of employment.

The bankers know, the world knows, that the reason for industrial upheaval and unemployment is because the business world is refused the privilege of using its credit by withholding from it the medium by which credits may be exchanged (money). This awful power whereby one private citizen can refuse another private citizen the use of that thing which he, himself, has created—his credit—is false and sustains its position by virtue of the ignorance of its falsity in the minds of those concerned.

Money is not a commodity (wealth), and hence cannot become capital. Dollars are but bridges, devised by the people as a whole, through the medium of which they expeditiously and economically carry their credits from one to another. Imagine, if you can, the stupidity of the masses when they with benign equanimity can observe a few eminent financiers establishing toll gates on each bridge and charging the people, the owners thereof, a heavy toll for their use, or, when occasion is ripe, closing the bridges altogether, thus throwing all industry into upheaval and consequent unemployment.

In the very nature of things there can be no periods of unemployment. Our daily demands are the same one day with another. We eat, wear and use as much one day as another. It requires an even flow of production to supply this even flow of consumption. Were things left to take their natural course, any industry which is "exceeding the speed limit," will, if endowed with common sense, slow down and observe the law for its own protection.

Under our present system this condition does not obtain. There is no fixed and definite limit. Business can only guess at the proper speed for today by consulting that of yesterday. The control of this matter is in the hands of the bankers who arbitrarily set the pace for the day and that very late in the afternoon.

One fine day the business world starts on its daily round. Everybody is in high glee, the cars go humming along.

The bankers, observing it will be to their interest to lower the speed limit, see, or at least pretend to see, imminent danger to all those dear people out there traveling at that breakneck speed of the yesterdays, and solemnly and prayerfully lower the speed limit almost to the vanishing point. (Call in all outstanding loans and refuse to make any more).

The business men are in trouble. Not knowing what the speed limit was to be, they have exceeded it and thus broken the law. They are under arrest, their cars have been confiscated and they are miles from home and broke. A sorry plight. The question of the unemployed is now present. As the men near home they find the bankers ready to welcome them. These oracles of economics dilate on the unfortunate circumstance, blame the reckless disregard of the law and assure the unemployed that the awful bogey of over-production or something just as hideous is to blame for it all.

An august committee is appointed and those bogeys are due for another investigation.

A Plan That Would Eliminate Unemployment

With an Amended Monetary System the Government Could Provide Work by Building Roads During Industrial Depressions

By LEE DIGBY

THE effective balance wheel in the dominant industrial problem of all civilized countries, that of unemployment, will be found in the accompanying paragraphs of this article which is submitted in the earnest hope and desire that it may lead to the taking of initial steps toward the elimination of this perplexing situation in our own country, and thus permanently place our people in the highest state of progress of any people in the world.

The writer, who has closely studied this subject for many years and under especially favorable conditions for observation, has sought clearly to portray the basic necessity at this time for the people, through their proper representatives, to grapple with the weakness of our present monetary system and so amend it, as to enable the system in the future to serve all the people in all times, whether they be of industrial activity or industrial depression. With this first step accomplished, there could be instituted a campaign of public road building in the United States, on a scale that automatically would absorb all surplus labor of the country, releasing such labor when industry demanded it for regular channels of trade. Thus at no time then, would there be a period when there would not be sufficient work to employ at fair pay, all able-bodied persons either on the vast road system building by the nation or else in the ordinary industrial channels. One would act as the balance wheel for the other, practically for an indefinite time.

Of course, the writer believes that this vast problem of unemployment, which appears to bother the entire world today, should be dealt with from the standpoint of the Golden Rule, so wonderfully taught by the Master Mind in His Sermon on the Mount—specifically stated in the seventh chapter of Matthew, 12th verse:

"Therefore all things whatsoever ye would that men should do to you, do ye even so to them: for this is the law and the prophets."

With this idea in mind we will get down to the heart of the subject and grapple with its seeming difficulties, and when we have cleared our vision from them, let us start something.

It is not difficult to convince ourselves that this great country of ours can employ all of the surplus labor and more, too, and under all conditions of business, in the construction of a national system of broad, permanently builded good roads, and in the irrigating of our arid lands and draining of swamp lands so as to open them for settlement and cultivation by the idle, yet willing-to-work, citizens of the United States.

Our government has the right and the power today to call all the state governors together in this united effort to settle for all time, this grave and vexatious matter.

Now, the principal reason for the stagnation of effort toward extensive road building in the country lies in the belief of the inability of the public to raise sufficient funds for the enormous undertaking, which would easily consume a century to bring to a full consummation, but which then would give us the greatest system of national roads the world has ever known.

With the production at this time annually of about twenty billion dollars' worth of products from the farm and soil, including all kinds of foods and clothing, building materials taken from clays and stone, all needing to be transported from point of production to point of consumption, or to seaboard for export, one can readily realize the enormous value to the country of the proposed system of permanent good roads, extending to every nook and corner of the nation. That the project would be stupendous, too, is recognized, but in that is one of its attractive features. We have thousands of the most wonderful engineers the world has ever produced, who are only waiting to "go at it" and to solve such a road system's constructive problems. The country, in other words, has the need for the roads, or the roads to build, which would make the country what it can be and should be. We have the men to build them and the materials for their construction in abundance; men trained and willing, as was demonstrated during the World War, a training and a daring never equaled in the history of the world.

The only hindrance, therefore, to the realization of this huge project, that will solve our most serious and momentous problem, is that of providing the money for the work. Now let us tackle this alleged hindrance, and solve it in true American fashion. We recognize that the curse of the world's governments today is excessive taxation. But how can we attempt a great constructive project of this character without adding to the load our already overburdened taxpayers are carrying?

Pennsylvania will spend $50,000,000 through a vote of the people of that commonwealth, on good roads. But with the present wasteful method of building roads the state probably will spend $40,000,000 in actual road construction and waste the other $10,000,000 through inefficiency. This $50,000,000, being borrowed at five per cent interest payable in 20 years, means the people of the state will have to pay practically 100 per cent interest, or in other words, the taxpayers of the state will have to pay $100,000,000 for $40,000,000 worth of good roads.

Now let us present a more sane and correct method of financing road building, with less burden attached to it. The fact should be remembered that the government of the United States can, and has the right, to issue bonds to the people to any extent for national defense and general purposes of war. Under such power, the government can issue bonds to the various states, to provide for the construction of good roads to any extent demanded. These bonds can be purchased by the various states, payable according to agreement in from 20 to 30 years in annual payments, but without interest. Please note, I say *without interest*, thus saving the people about one-half the expense of road building under present methods. Such bonds as are issued by the government can be deposited by the states with the government, after their purchase, and against them the government can issue the necessary currency to their full face value, this currency to be used for the cost of road building. The issuing of currency in this manner may disturb the minds of our financial people, but if you look into the subject carefully, you will quickly see that the lifting of the bonds by the various states means also the simultaneous cancellation of the currency issued against these bonds, thereby leaving the amount of currency the same as before the bonds were issued, and remaining so until new bonds are needed.

This proposition is a simple, hard-headed business matter that requires no philanthropy or charitable construction, but rather it is a move in the right direction toward equipping our nation for defense in case of outside attack through providing instantly highly efficient means for the transportation of troops and army supplies and commerce at a rapid rate from one point to another. But to do this, it will be absolutely necessary for the people to be considered as a whole and become, in fact as well as in theory, the power behind this government and its activities.

The next question to be settled is: How is the enormous expenditure for this improvement to be met, even without interest on the bonded debt? And here is the solution of this important factor in the proposition:

We first save 50 per cent in the cost of the roads by issuing non-interest-bearing bonds. Next, the roads will be built and paid for while in use, thereby saving the taxes ordinarily collected each year for the upkeep of the old dirt roads. Finally comes the saving through the lowering of costs of transportation throughout the nation and in the *enormous increase in taxable values of all rural properties.*

At this time there are twenty billion dollars' worth of farm produce to be hauled annually in this country, besides an ever-increasing parcel post and commercial hauling. It is estimated that it requires 50 per cent of the value of the farm products to haul them to their destination, but to be conservative, or, let us say, "play safe," we will say 25 per cent of the total value, or five billion dollars, is the cost annually for moving the nation's huge crops. Let us see what a saving of good roads would mean in this way annually.

In the old days and old methods, it was possible under favorable circumstances to haul 25 bushels of wheat or grain over a mud road 20 miles a day. This is based on the average of 20 miles' transportation from the average farm to the market. But over new and modern roads under such as proposed, experience has shown that 100 bushels of grain could be loaded and hauled and unloaded in five hours, or 200 bushels in a day of 10 hours. This performance compares with 25 bushels in 14 hours under the old method. Thus only a brief examination will show that, without a doubt, all these roads can be built out of the savings in the haulage cost for farm produce alone. Now just estimate the revenue from pleasure cars and commercial trucks in Pennsylvania alone. This would cover the payment on these roads' bonds in 30 years quite easily.

Not only can these roads be built without additional taxation, but their building will reduce taxation by increasing suburban and county population enormously and thereby enhance the value of rural lands by billions of dollars. Another and most desirable feature of this idea, and the sanest of all, will be the greater inducement to the present residents of cities to move out into the healthy suburban territory, made possible by destroying the worst enemy the human mind has to deal with—*fear and loneliness*—in the present methods of living in the open country, especially at night.

With this as a starter, one can see the limitless possibilities in this great country of ours; with abundant new fertilizers and intensive farming over the entire area of the nation, this country need not fear twice or three times the present population. But it must be a country "of the people, for the people and by the people" that can only be possible when the people handle their financial problem on the basic understanding that it is for the good of all of them, and not for a special favored few.

Now, don't say this cannot be accomplished. It is a simple mathematical proposition and accompanied by the will and push of all the people and operated on the basis of the Golden Rule, it will be unfailing in its success.

Finally, the work of building good roads and draining swamp lands should be under the direct charge of our army engineers to insure uniformity in construction and suitable strength to carry the weight of war materials and traffic in case of need; or in case of invasion by some nation. With deep foundations for such roads, of from one and a half to two and a half feet of concrete and a suitable top finish, which could be replaced when worn out, at reasonable cost, these roads should stand indefinitely and not require repairing before they are paid for.

Our army engineers are already provided for, as salaried officers of the government, trained and educated by the government for any service and for any emergency, as in case of war. By their supervision, the government would keep in touch with all the states and unify the work on a broad scale for the good of all the people without political favoritism.

Let us have more statesmanship in our politics.

Hell Gate Bridge From an Airplane

(C) Gilliams Service

This extraordinary railroad structure connecting the upper end of Manhattan Island with Long Island was recently finished after years in building, as it presented many tremendous engineering difficulties. It winds around over land and water like a gigantic reptile and is one of the sights of New York City. Because of its great length and winding nature, it has been found impossible to give any comprehensive idea of it from a photograph. This picture from the air, however, shows in its entirety this wonderwork of man. Hell Gate, from which it takes its name and which it crosses, was for years famous among navigators as a dangerous pass in the East River.

Native Haunts for Birds in a City Museum

TO THE Chicago Academy of Sciences belongs the distinction of possessing what is undoubtedly the most unique natural history display possessed by any museum in the world. It consists of 20 habitat groups showing the birds in their homes and in feeding.

Perhaps the most remarkable thing about these groups is the fact that the background is in each instance a photograph of some scene in the vicinity of Chicago, taken where the material was collected, enlarged and colored. These backgrounds are so cleverly executed and placed with regard to perspective that, in conjunction with the natural material used in the foreground, such as the branches of trees, shrubbery, grass, fences, stones, and so on, they completely deceive the eye and make one believe that he is really viewing an out-of-doors scene.

The photographs used for the backgrounds were taken with cameras ranging in size from 4 by 5 to 8 by 10 inches, then enlarged to 5 by 15 feet, and tinted in transparent oil colors. The making of such huge enlargements was an achievement in itself. First, it was necessary to build enormous trays in which to develop and fix the specially manufactured sensitized paper, it being impossible to find any single sheets of the required width and length in stock. In making the enlargements six men were required to run the paper through the developer, two at each end and two in the middle. After developing the print the developer was drawn off, fresh water run over the picture and then the hypo, to fix it, turned in, in the same tray.

All the work of making the enlargements was superintended by Frank M. Woodruff, assistant curator of the museum. Mr. Woodruff also conceived the plan by which photographs of the completed groups for illustrative purposes were obtained.

To obtain the proper effect, it was found necessary to photograph the groups by the indirect light in which they are exhibited, an exposure of about two hours being required in the majority of cases.

For the same reason the tinting of the enlargements was also done by artificial light. From ten days to two weeks was required to color each picture.

The mounted birds in each group are quite as remarkable in their way as their surroundings. In assembling the groups, the academy sought for the "news interest," to make them interesting for the man who has no scientific knowledge and whose attention must be caught. Thus the attention of the visitor is not only attracted, but he sees the birds in their natural surroundings. One group, for instance, shows a couple of fine mallard ducks at sunrise. A while back and the ducks would have been as stiff as bric-a-brac; now they are poised in flight, as lightly and almost as vitally as though they were actually rising from one of their neighboring waters. Another group shows a family of kingfishers in and about their nest in a cliff.

The background for this group, which shows a stream in which a number of cows are wading, was photographed at a point where an exactly similar cliff, housing a family of kingfishers, existed.

The 20 groups cost $25,000, and required a year and a half to complete.

Anyone who has taken the trouble to watch the interest with which visitors observe and study these and other bird groups in other museums mounted within their natural surroundings will realize how great an educational factor they are. Children feel greater love for the birds when they see them patiently brooding on a nest hidden among the grasses and flowers, when they see the mother quail teaching her little ones to "freeze" beneath an oak leaf, when they see how cleverly they weave their nests, binding them tightly to the the tree branches.

Above, left—Herons and their nest. Above, right—Winter scene, with snowbirds. Below—Horned owl and young on nest.

How much wiser and more sympathetic a way to teach bird life than the olden way of dissecting them or of committing their names mechanically to memory without learning much about their pretty human ways. City children who have not the privilege of getting out into the country to see the birds in their native haunts will find such groups as these a wonderful help to their imagination. They will never forget these groups any more than they would a trip to the country where real birds live.

Few children, city or country, have seen an American eagle on its nest, few are able to see a snowy owl. These groups are almost as good as a real trip to the woods. The noticeable difference between the stiff unnaturalness of the old methods of mounting and the lifelike naturalness of these is typical of the increased interest in bird study and knowledge of their habits. This increase of interest in our little feathered friends is the result, in part, of the widespread information sent out by our government, of the great value these pretty songsters are to our country. Heretofore, we have felt them to be beautiful like the flowers, now we know them as of incalculable value. The more we learn about our bird friends the better for us all.

How Wall Street "Milked" One Railroad

Concluded from page 10

The partial cost to the Katy in discounts and interest on the security issues they authorized, amounted to the enormous sum of $6,865,425. The Jewish banker sold the $10,000,000 one-year notes to the public in 1910. In 1911, this same banker sold the $12,850,000 two-year notes to take up the $10,000,000 notes. In 1913, the same Jewish banker sold the $19,000,000 notes to take up the previous issue.

Now let us note the result.

Outwardly the Katy was growing. Gross earnings were larger from year to year. But down at the core, discounts, banking commissions and interest were eating up the surplus earnings. Railway lines acquired, on which the Katy had been compelled to guarantee mortgage bonds, principal and interest, created annual deficts in growing volumes; the short-term loans behind which, by this time, there was scarcely any equity, were a growing burden that could not possibly be met.

And these men knew it.

In the year 1914, the president of the trust company, and the partner of the alien banker quietly resigned from the directorate of the Missouri, Kansas & Texas Railroad. Such departures are usually mentioned in a company's annual report. *In this instance no announcement was made that these men had left the board.*

Financiers Get Out From Under

AN OLD ship captain whose vessel was interned in South America, once told me a sailor's yarn of how the big tropical rats had devoured his cargo and how, after they had cleaned out the hold, they gnawed a hole in the ship's bottom and sank her before they escaped.

Naturally, financiers of such prominence could not be asked to face the gathering storm. It would never do to compromise the modern system of "financiering" by letting a pair of its leading men remain on the board of the Katy in case the road defaulted.

The $19,000,000 notes of the Katy Railroad were due in May, 1915. They could not be met. In September, 1915, the Missouri, Kansas & Texas Railroad thundered into bankruptcy, with a funded debt of more than $173,000,000, and total obligations in a far greater amount.

Now why, in this emergency, did not the Jewish banker, and the president of the trust company come forward with the immense resources of their institutions to relieve the needs of the Katy? They had authorized the successive financial operations that led to the $19,000,000 note issue, which had wrecked the road. And they had profited immensely by them. They knew that intrinsically, the Katy was a solvent property. In spite of that, the Katy was deliberately doomed to bankruptcy.

More than a score of "protective committees" were immediately organized in Wall Street to "guard the interests" of the unfortunate security-holders. For Wall Street thrives on receiverships. Large sums are made through the reorganization of bankrupt properties.

Yet these two men were bankers of vast experience. The president of the trust company possessed knowledge second to no man in the reorganization of bankrupt corporations. For years he had been the most striking figure in the "protective committees" and "reorganization committees" advertised in the financial columns of the newspapers. He had that quality known as personality, was large and genial, and was never known to enter his impressive offices in Wall Street without wearing a nosegay in his buttonhole. He had reason to have confidence in his judgment. Through his management, he earned from 50 to 60 per cent dividends annually upon his company's stock. That stock, which had a par value of $100 a share, sold in the neighborhood of $1,150 a share. At Christmas time, the indulgent directors, among whom was his railroad associate, the Jewish banker, were accustomed to present him with a bonus of $50,000 in addition to his generous salary, as a token of their appreciation of his efforts in making money for them.

The head of the alien international banking house, which financed the Katy, is a small man, who may be seen daily walking down Broad street, to the Midday Luncheon Club, wearing a tall silk hat and frock coat to disguise his short stature. He is physically frail, and quite probably that is the origin of his unfortunate temperament, which has made him unpopular in the Street. The financial district has often been enlivened with stories of his quarrels with his own partners. As a matter of fact, the German partner who represented him on the Katy board soon after left again for Germany to become head of the National Bank of Berlin, because he could not get on with his associate.

Small as may be this Jewish banker's physique, he is endowed with a comprehensive brain. I met him on the day of the San Francisco earthquake, and of all the men I saw in Wall Street on that eventful day, he was the one who most ably foresaw the cruel outcome of that catastrophe, which was one of the prime causes of the panic of 1907, by reason of the wholesale destruction of real values. It is a pity that his abilities and useful knowledge are not devoted to the advantage of the country. For could not this discerning banker have foreseen the coming tragedy of the Katy?

Plight of Investors Is Pitiful

THE Katy Railroad is small compared with the great trunk lines of the country. The profits made from the "financing" of this road was merely a piker's game for Wall Street. There is no intention to sit in judgment upon the men who managed it, for, after all, they were merely following out the traditions of their calling. The average American business man could have kept this property solvent. The only conclusion to be arrived at is that Wall Street financiers are bad business men. Their absence of a sense of responsibility toward the security-holders whom they represent is one of their most remarkable traits.

As I write this, there lie on the desk beside me hundreds of letters from investors in the stock of the Missouri, Kansas & Texas Railroad. Many of these missives are heartrending. The plaint of most of the writers is that they are in no position to pay the heavy assessments demanded by the two other Jewish banking houses which have advanced the plan for the reorganization of the Katy.

These people had bought their securities, trusting in the faith of Wall Street.

That faith has not been kept.

Helping the Men Who Went Wrong Go Right

By ROBERT H. MOULTON

HE GLANCED up from his ledger and caught the invitation of the treasurer's index finger. Once before that same signal had meant a raise of $25 a month—or, as he and his wife had put it, a balance in a savings bank.

He put down his pen and walked into the treasurer's office with an expression as nearly radiant as his inscrutably set face ever wore.

When he came out, a change had come over him. His face was pallid and his lips were set. Yet he again had been offered a raise—not merely $300 a year more, but double the salary he had been getting. And instantly he had refused it. There never was a man more dumbfounded than the treasurer by that refusal. The tender of his own position, which he was soon to resign, had been curtly refused. And as though it had been notice of discharge, the man whom he had promoted to the confidential set of books had served notice that he would leave within the week. "Time to quit," the man muttered to himself, as he finished his posting, put the books away in the private office and prepared to go home.

Once before, as he vividly recalled, it had become time for him to make a sudden, iron resolution to quit. When the last bar had yielded to his saw he had heard the turnkey in the corridor and abruptly he threw himself on his bed. "Here's a paper," the turnkey had said, and went on. The prison was just waking up; summer dawn was creeping through the grated windows. He left the bunk and took the paper to the light. Soon his eye caught the dispatch from Albany that announced that the New York legislature had passed the habitual-criminal act. He shuddered slightly and glanced toward the nearly severed bars, knowing that if he escaped and was re-arrested, he would be likely never to walk the streets again a free man. It would be "life" for him. He would spend the remainder of his life like a fly in a bottle. "Time to quit," he had muttered.

Above—DR. F. EMORY LYON, of the Central Howard Association, interviewing a paroled man. This man served 11 months for robbery, was paroled, made good and was discharged with credit.

At left—A man arrested for alleged violation of the Mann Act (the woman was his legal wife), held several months without trial. The association procured his release.

A bright young chap with all the "makings" of a first-class crook. He ran away with an automobile and was given 21 months to repent. Coming to the association on parole, he was encouraged to make better use of his salesmanship experience; made steady progress during a year of parole and is apparently safely on the road to a successful business career.

Better discipline at home when he was a boy would have kept him out of trouble, but he was sent to the reform school from Cincinnati. It was only a short term, but when he went back home he was branded as a discharged prisoner of the state, one of the fraternity against which most police officers feel that they are pitted in implacable strife. When he followed his determination to be decent and get work, the first man had said: "Come around a little later." It was not only the reply, but the quizzical smile that accompanied it which had made him taste the gall and wormwood which most discharged prisoners must swallow, if unaided, a potion which turns many of them to the underworld, in desperation. He had not done so heinous a thing that mankind should shun him as a loathsome, dangerous, hunted thing. He was "broke" and hungry, but he went on hunting for a job until another man turned him down cold and added some stinging words about convicts.

That is what goaded him, as it goads others, into following a desperate game, when he met a young fellow who also had served a bit in the reform school.

They went in deep and the next sentence was to Columbus. That gave him a postgraduate course in the ways of the underworld, the tricks of the cleverest of the confidence men and burglars. With the ruses and wiles of crime an open book, his active mind soon set him to contriving burglaries as the leader of a gang, and the disposing of the loot. He never tasted liquor and was equal to any emergency. Crime became an absorbing business with him, outlawed business filled with the ever-present dread of capture. He saved money, but all he had ever saved went in the effort to save himself when he landed in an officer's arms. He was sent to the penitentiary in Kansas and there he "did time," endured the grinding monotony of prison life and prison fare, as a prisoner.

It was certain that all that buried past would be revealed, if he applied for a fidelity bond, as would be necessary, if he accepted the position of treasurer that had been offered to him. It was that which made him decide in a flash that he could not be treasurer.

That night he did not go directly home. He telegraphed to Superintendent Lyon, of the Central Howard Association in Chicago, using a name he never before had used in that town—his own. The association had found him the job as bookkeeper when he was about to be discharged from the Kansas prison. In that case he had applied without expecting anything but advice, but he discovered when his case was taken up that its affiliations and its system could help a convict when he needed it most. A day or two later he received a reply, crisp in its instruction to report at once for another position.

He got the new job, began again, and worked himself up to a good salary. Then he received an offer from another company which accepted his record in the two recent positions without questioning his past. He made good, and is now drawing $4,000 a year as sales manager. He has nothing now to fear from the police, for he is a new man, his alertness, his decisiveness turned to new use.

In the 20 years of its existence the Central Howard Association has assisted more than 15,000 men, just emerged from prison, to begin life over again, acting as the mediator between the prisoner and the rebuffs of "outrageous fortune." Most of them obtained employment with broad-minded business men who were willing to give them an opportunity.

Eighty per cent of all the men who have come to the association during the 20 years of its activity have made good, and thousands of them are now established as useful citizens throughout the country. By their own unaided efforts they could scarcely have won, since they came in most cases without money, experience or adequate initiative.

In 1920 the association assisted 2,000 men at an average cost of $7.50. Of this number 147 were paroled to the superintendent, and the earnings of these men for themselves, as given on the association's records, of monthly reports, amounted to $67,338.

The estimated earnings, on the same basis, of the 2,000 discharged men brings a total of approximately $1,000,000. Add to this amount of earnings the $400,000 that it might otherwise have cost society to keep these men in prison, and we have a net gain of 90 times the cost to the public of maintaining the Central Howard Association.

The nation-wide responsibility of the association for the proper care of the ex-prisoner is shown by its record indicating the nativity of each applicant. From 14 countries came some 350 prisoners, for whom as a foster country, we have assumed the obligation of freedom and justice. Every state in the Union furnished one or more of these men who applied to the association for aid. Inasmuch as not more than one-fourth of these men belonged to any one state, either by reason of nativity or incarceration, it is apparent that the problem of caring for them is interstate and national. No state can assume its obligation alone, since other states are necessarily already caring for some of its delinquent citizens.

The important thing for these men, and for any community, into which they happen to come, is not what they have been, but what they will become if given an opportunity. The question as to where they were born, and why, when and where they were imprisoned, fades in the face of the pressing need for work and a chance to prove their worth. This need the Central Howard Association is seeking to supply. The fruit of its endeavors is shown not only in the number of men it has encouraged, advised and aided in a material way, but in the continued and rapid changes taking place in public sentiment toward the offender and in the new freedom given to those in bondage everywhere.

One of the finest tributes ever paid the Central Howard Association is contained in the following which came unsolicited from a discharged prisoner whom the association had once befriended:

"A little more than a year ago I was discharged from a prison in New York State, where I had just finished serving a term for highway robbery committed in New York City. There I was born and there I had for a number of years pursued a criminal career. Before obtaining my freedom I had resolved to reform, to get work, and lead an honest life.

"My best efforts to get a job of any sort were unsuccessful. So about a month later I left New York, with $5 in my pockets, and an unbroken resolution to stick to living on the 'square.'

"Last August I arrived in Chicago on a Wabash box car—ragged and friendless—after a zig-zag chase of that Will-O'-the-Wisp, a job, more than 2,000 miles. In a couple of days the few dimes I had were gone for food and lodging, so that I presently found myself homeless, jobless and broke.

"In casting about for material with which to write East in an endeavor to get some money, I decided to ask a prison association to oblige me in this regard.

"A search of the city directory yielded the address of the Salvation Army Prison Bureau. Going there, I told the officer in charge that I was an ex-convict and would appreciate the favor of writing materials, and so on. He said there were no facilities there for writing; that I would perhaps find better accomodations at the Central Howard Association. He very courteously invited me to return to his office, if I met with failure there.

"On the twelfth floor of a large office building in the heart of Chicago I found the Central Howard Association.

"It was my lucky day—in that small suite of offices I was to find more than I consciously sought or from my previous experiences had been led to hope for.

"On explaining my errand briefly, a littered table was cleared for me. Pen, ink and paper provided; no questions asked, and I proceeded to write for two hours. When I finished and prepared to leave, I was called into a small private office. 'You are a stranger here? Looking for a job? Have you a place to sleep tonight? to eat?' The man who asked these questions gave me money for my supper, lodging and breakfast, and told me to come there in the morning; that he would send me to some place where I might get work.

"I left there that afternoon with a new grip on my resolve to stay straight. No word had been spoken of reform, no maudlin pretense there, but instead the square dealing of practical help and understanding.

"The next morning I was given several cards and directions. Each card bore an application for work addressed to an employer specifying the job sought and my name. Each bore the signed recommendation of F. Emory Lyon, of the Central Howard Association.

"Business was unusually depressed, and jobs more than scarce. Every day I went there for those cards until I finally procured a job. Every day for two weeks I found the same unfailing willingness to help me get work. Every night I was given money for food and lodging. Every day many others were receiving the same help and encouragement.

"Chicago may well be proud of the work of this prison association; of the work of Dr. Lyon and his assistants. The reform of a criminal is generally considered a rather hopeless proposition, both by the public and by the criminal himself, and with good reason. Therefore, the spirit and efficiency of the Central Howard Association are rare indeed."

THE LIBRARY OF THE
UNIV OF ILLINOIS
URBANA ILL

BRIEFLY TOLD

German engineers have surveyed a route for a Germany-New York-Chicago air line, according to reports. Two German aircraft engineers visited this country some time ago to study the possibilities of a fast Zeppelin passenger service over this route. Kite balloons tested the upper atmosphere by means of delicate recording instruments, and Weather Bureau records were examined and studied.

Fines on overdue library books paid to the public library of Chicago run $40,000 a year, according to the librarian. This money goes into a pension fund for Chicago library employes. The fund totals approximately $200,000 at this time.

The greatest home-owning city of any of the 30 largest cities in the United States is Toledo, Ohio, according to reports. Seattle and Baltimore stand second and third, respectively, and New York City is last on the list.

China's foreign trade has increased 500 per cent in the past 30 years.

The native women of the Black Forest of Germany still use the ancient spinning wheel for spinning their flax.

Samuel Pepys' books, about 3,000 in all, repose in the original bookcases, which were made for Pepys in 1666 by Simpson, "the joyner." Pepys began his diary when he was 27 years of age.

Army horses and mules are now being fed a new form of compressed food which is expected to solve the question of feeding army animals on expeditions or in times of war. The food is in the form of compressed brick containing the finest grade of oats, with about 13 per cent pure cane molasses for food value. Four quarts of oats are used in each brick. Tests are now under way at Forts Robinson, Sam Houston and Bliss, in the United States, at Coblenz, Germany, which is occupied by American forces, and in the Canal Zone. The government has purchased 20,000 tons for experimental purposes.

The *Luminara,* a newspaper at one time published in Madrid, was printed with ink containing phosphorus, enabling the reader to peruse the paper in the dark. The *Regal* was printed with non-poisonous ink on sheets of dough. After reading the printed matter on the thin sheets of dough the "paper" was eaten.

Wireless messages are being received at experimental stations in Australia in one-fifteenth of a second from London and Paris and one-eighteenth of a second from New York. The cost of wireless messages will be a third less than cable messages, according to estimates.

"Jewish Influence on American Life," Volume III in the series on "The International Jew," comprises a third selection of articles on the Jewish Question, and is now off the press. It contains 256 pages, and will be sent for the cost of printing and mailing, which is 25 cents.

"The International Jew," Volume I, and "Jewish Activities in the United States," Volume II, 235 and 256 pages, sent for 25 cents each.

The army airship Roma, recently purchased by the United States Government from Italy, was christened with a bottle of liquid air. The bottle was dropped from a free balloon on the bow of the craft.

The records of Stratford-on-Avon from 1553 to 1566 have been published by the Dugdale Society of that place.

A slab of Connecticut Valley sandstone on which are imprinted seven footprints of a giant dinosaur, which traveled that way millions of years ago, has been presented to the department of geology of Mt. Holyoke College.

Dress creations are works of art, according to a recent French ruling, and as such are protected by the counterfeiting laws. A Paris court inflicted fines and damages of approximately $1,000 each on two firms which had copied the model gowns of a Paris dressmaker.

The oldest room in the Sun Hotel at Canterbury, England, once the home of Charles Dickens, was nearly destroyed by fire recently. This building dates from 1503.

Game birds and animals of China are being wiped out owing to wholesale exportation in cold storage to satisfy the demand for foreign markets. There are no adequate game laws in that country.

Dust-shooting revolvers are part of the equipment to be taken into the jungles of Brazil by scientists. The revolvers are to be used in bringing down high-flying insects that cannot be netted. The scientists are carrying 2,000 grains of quinine, and they are planning to penetrate far beyond the River of Doubt in their search for hitherto uncaptured specimens for the zoological collections of colleges in the United States.

The French Government will erect a monument to the last American soldier killed in action in the World War. The American Legion will determine the name of the soldier.

A law banning cigarets as a "national curse" was urged by the master of the New Hampshire State Grange, at the 48th annual meeting recently held in Concord.

The American Indian Arts and Crafts Foundation is an institution organized by a Wyandot Indian, which has for its purpose the restoration of the arts and crafts of the Indian in the United States. Choice specimens of hand-made blankets, baskets and pottery are very rare, and the country is flooded with imitation art-work that passes for Indian art, says the Indian. These industrial art centers will be on or near the reservations and will furnish work for the Indians the year round.

Americans do not require passports to enter Mexico.

As a more positive means of identification for depositors in Chicago postal savings banks, the use of finger prints will be placed in effect soon. As many depositors are unable to write, the new method will furnish a simple means of identification.

In the belief that the present generation of grown-ups in Mexico enjoys the sport of bull-fighting so much that it is impossible to prohibit it, attempts are being made to keep children away from the fights. The governor of the federal district and the mayor of Mexico City have joined forces with prominent newspapers in an attempt to prevent boys and girls witnessing the brutal sport. It is believed that if the youngsters are prevented from seeing the fights the next generation will not want them.

A Scotch naturalist and explorer plans to take a 3,000-mile trip through the Sahara Desert next spring. He is in search of a man to accompany him and says the chances are even that neither of them will see civilization again. The trip is to be made to collect zoological and archeological specimens and also new animal specimens.

When an HS2L seaplane from the Canadian Government Air Station at Jericho Beach, British Columbia, was forced to land on the gulf off the Fraser River, it found itself unable to take off again on account of heavy seas. The fliers dispatched a carrier pigeon with a message to the air station. The bird flew to the roost at the station and a bell rang in the office, announcing its arrival. Help was at once sent out to the seaplane and the passengers and plane rescued.

The Ancient Alphabet of Montezuma

Light Shed on Writing System Used by Primitive North Americans

Chronicler of the Neglected Truth

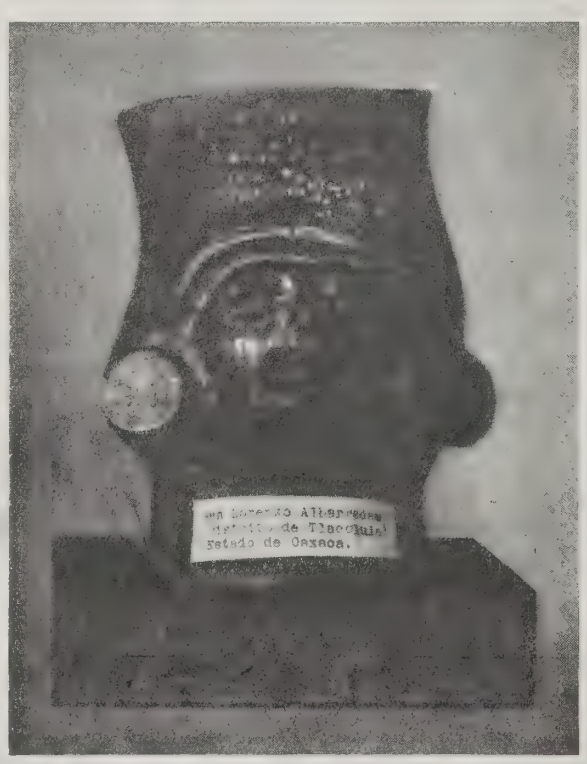
Reading the Ancient Alphabet of Montezuma

Light Shed on Writing System Used by Primitive North Americans

By DR. PEDRO M. ELIAS

Curator of the Department of Ethnological Reservations of the National Museum of Mexico.

(Drawings after Penafiel)



NO GREATER problem confronts the ethnologists of the world today than the history of the three empires known to have existed prior to the Conquest in the Americas south of what is now the southern boundary of the United States. Through the fanaticism of the priests who accompanied the Spanish *conquistadores,* and the destruction wrought by the soldiers in their search for treasure, the written and painted records of the Nahuas, the Mayas and the Incas were destroyed with such thoroughness that the specimens of the writing—either in characters or in pictures—left to present-day students can be counted on the fingers of both hands. Of completed manuscripts, either on the heavy paper manufactured by these races, or on deerskins, there are only seven—three of the Nahua, two of the Maya and two of the Inca—which are indubitably genuine, though there are a number of "picture-writings" made during and after the Conquest, by Nahua and Maya men who joined the Spanish forces. These were made for presentation to the Spanish conquerors, and were composed largely from the memories and imaginations of the makers, so their value historically is virtually nothing.

For more than 20 years, students in various parts of Mexico, under the guidance of officials and curators of the National Museum of Mexico, have been studying various remnants of the writings of the Nahua and Maya priests along parallel lines. That is to say, by finding a common subject treated in several writings, they have been endeavoring to evolve the system of characters used by these ancient writers to express certain sounds, and thus come at a "phonetic alphabet," if I may call it such. That is, an alphabet each character of which represents a word, a phrase or a whole sentence, something after the manner of the Chinese ideographic writing, and unlike the modern alphabet in which each letter represents a sound, which sounds, in turn, are made into words. These investigators have progressed so far that they have been able to establish certain symbols as synonymous with certain words; certain combinations of symbols as meaning certain expressions, and certain pictures—or ideographs, as some call them—as always representing the same man, place, animal, or action.

This work has been accomplished largely in the study of the language of the Nahua Empire, of which the Aztecs were in control, and of which Montezuma—or, more properly "Moquahtesuma"—was emperor, at the time of the arrival of Hernando Cortez and his band of adventurers on the east coast of the Gulf of Mexico, early in the sixteenth century. It must be understood, first of all, in any discussion of the rather remarkable discoveries these students and investigators have made, culminating during the past two or three years, that the Aztecs, though by far the best known of the peoples of the New World prior to the coming of white men, were by no means the most advanced. There were two great empires—that is to say, great, among primitive peoples—in North America before the Spaniards arrived. The greatest of these was the Maya Empire, which, originating, it is believed, about the time of the beginning of the Christian Era, in what is now the area occupied by the eastern halves of the states of Tabasco and Chiapas, in Southern Mexico, spread northward to within about 100 miles of the present Mexico City, and southward at least as far as Nicaragua, possibly clear down to the main continent of South America. This empire, which was made up of an agricultural people, with probably 50 separate tribes united in it, had a form of written communication not unlike that of the Egyptians. It had certain fixed characters, representing certain fixed sounds, and these appear again and again on both carved monuments throughout the present Mexican states of Chiapas, Tabasco, Vera Cruz, Yucatan and the territory of Quintana Roo, and on such poor specimens of manuscripts as escaped the destroying hands of the *conquistadores* and their not less destructive *padres*. Unfortunately, there has not been found any such key to this hieroglyphic writing as the Rosetta stone has been to the Egyptian glyphs. Consequently, the study of the Nahua writings has been more productive.

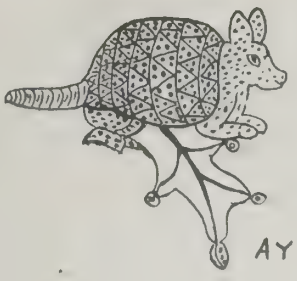
The other great people in North America in the memory of history prior to the coming of the Spaniards, were the Nahuas. They comprised some 30 tribes, bound together in a loose sort of union, known as the Nahua, or Nahuatlac Empire. Their territory extended from the mythological "seven caves of Chicomoztoc," on the north, to the boundaries of the Maya Empire on the south. The seven caves, in which the Nahuas claimed to have originated, are supposed to have been somewhere in the neighborhood of the present Moki, Hopi and other pueblo villages in what is now Arizona and New Mexico. Of the origin of the Nahuas, however, nothing is actually known, other than that they did make a considerable migration, evidently from some point a great distance north of the Valley of Mexico, in which they were found in the center of their empire in 1521. It is believed that the Nahuas began this migration about 500 A. D., and that they reached the Valley of Mexico, then known as the Vale of Anahuac, about 700 A. D., having consumed some two centuries in a migration of about 1,200 to 1,500 miles. If these figures are correct, and there is reason to believe that they are at least approximate, a considerable light is thrown on the time required for migrations of peoples and tribes, which may be of value in the consideration of other migrations, such as the Aryan and the Athapascan.

These migrants into what is now Mexico were bound together by a common root language, spoken, in a greatly altered form, in some remote parts of Mexico to this day, though all knowledge of its written form has been lost. It is known as Nahuatl, and is the language spoken by the Aztecs, who had conquered and were ruling the other Nahua tribes, when Cortez reached Tenochtitlan (the city of Tenoch, a priest of the Aztecs) about 400 years ago. Tenochtitlan is now Mexico City, the Vale of Anahuac is the Valley of Mexico, but hundreds of Nahua names of settlements, towns, mountains, rivers and tribal boundaries still remain, incorporated into the Spanish spoken in Mexico. It was through this casual, probably accidental, certainly unintentional, preservation of these place-names that the investigators of the National Museum and other students, have been able to make their most important discoveries.

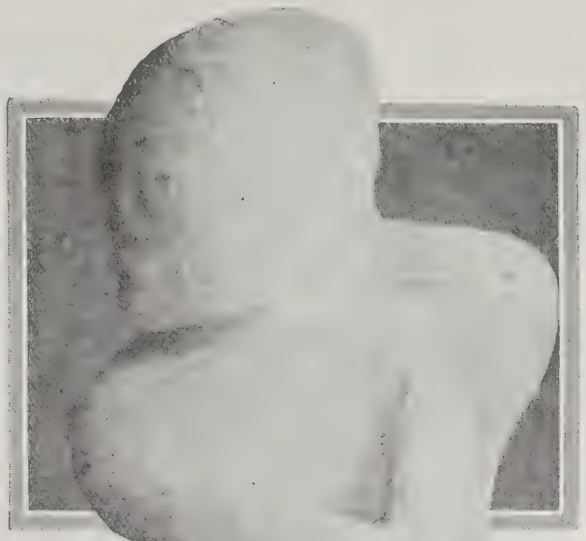
A painted and partially glazed clay drinking cup from a Zapotec ruin in what was once the Nahua Empire.

The Nahuatl language had no characters for words, phrases or sounds; that is to say, it was a picture language. If one knew the story in the mind of the Nahua writer, he could very easily read it from the pictures that writer drew, just as among the Araucanians, and some other South American tribes, the story-teller who knows the beginning of a story represented by a string variously knotted, can tell the whole story, by following the knots on the string and revealing their meaning, group by group. These knotted strings, or thongs of rawhide, have been in use by primitive story-tellers of South America for centuries; were in use, in fact, when the Pizarro brothers landed in Peru. But they are rather memory guides and reinforcements to remembrance than actual records, and are of little use when the men who made them are absent, though there are certain knots and groups of knots which mean certain fixed places, dates, expressions, and even whole stories in themselves.

As with the knotted strings, then, so with the picture stories left by the Nahuas. In the extreme southern limits of the Nahua Empire, where the Nahuas, under the leadership of those New World Hessians, the Aztecs, had conquered certain Maya tribes, such as the Zapotecs, in what is now the state of Oaxaca, the civilization and culture of the Maya made some lasting impression even on the fierce warrior tribe which subjugated them; and we find the beginnings of a hieroglyphic writing, systematic and formal, on some of the Nahua ruins. But in the center and northern part of the Nahua Empire, there is nothing but the picture writing. Certain of these pictures, however, have fixed meanings. If groups of pictures with fixed meanings are found together, it is comparatively easy to translate them. Under Dr. Antonio Penafiel, away back in 1885, a collection of drawings of all the picture-names of the towns and districts of the Nahua Empire which have been preserved were collected. Nearly 15 years later, or about 1900, students found certain drawings, or parts of drawings, or fractions of figures, persisting in all these picture-names. While this discovery, in itself, did not mean so much, it gave the students and ethnologists of the National Museum some basis in fact on which to work in what hitherto had been a maze of conjecture, complicated by the erroneous reports and picture-writing given to the early Spaniards by contemporary priests and artists of the Nahua Empire.



Today nearly 500 of these place-names have been ascertained, their equivalent pictures discovered and their meanings established. There remain some 250 others, whose names have become involved with the Spanish, or have been corrupted through lack of understanding of the correct pronunciation, by the Indians who succeeded the Aztecs, Toltecs or other Nahuatlac tribes in possession of these districts and villages. Probably the majority of these never will be known, or, at best, never will be accurately translated, since conjecture and theory are worthless in a study of this kind; only the established facts, brought down in direct line from the days of the last of the Aztec rulers over the Nahua Empire, can serve as a basis for the reading of the few documents left to us from the Nahuatl of pre-Conquest days.



Some of the geographic names were very simple, as, for example, that of the district of Etlan, which still exists, and which had for its "coat of arms," a black bean, with the white "eye" showing at the top. The word was originally Etl-tlan—*etl,* a bean, and *tlan,* the common word for place, the resulting compound meaning "A place in which beans are abundant," and being shortened to *Etlan.* Others are very complicated, such as the picture-figure for the place known in the days of the Montezumas as Cuauquecholan. This sign consists of an eagle, standing on the ground, its beak almost touching a plant growing out of the top of a hill. This word is composed of the words *cuauhtli* and *quecholli,* meaning "an eagle of rich plumage," and *tepec,* a hill, or, less properly, *tlan,* meaning, as has been said before, "place where." The result is the compound word meaning "place, or hill, where there are eagles of rich plumage."

Simple as were the daily lives of these peoples, so were their symbols simple, their meanings clear, if one can but catch the key-idea to the picture. With thousands of members of the priestly caste, however, each engaged during much of his time in producing picture records tending to show the greatness of the god he represented, or the prowess of the leaders who had served that god, the same idea, the same place, the same action, the same person, was not always represented by the same picture, or even by a picture which can be approximately identified according to any other pictures. For instance, the word in the spoken Nahuatl which meant "hill" was *tepec,* but in the picture-names there are as many different kinds, shapes and formations of hills as one could find in a long trip through the Rockies or the Andes. Some are plain and instantly recognizable as hills, while others might serve for castles, pyramids, rude temples, or almost any other object which the artist happened to have in mind.

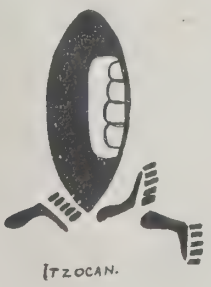
Some of these signs are easily recognizable, such, for instance, as that of the district of Nopalla, which is merely a branch of the flat-leaved cactus. This word is preserved from the Nahuatl in the Mexican Spanish of today, in "nopal," the common name for this form of cactus (an opuntia), and also for its fruit, commonly known, in the southwestern part of the United States, as the "prickly pear." Another is

(*Concluded on page 11*)

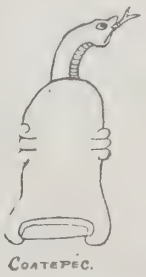
Stone image taken from the ruins of Quechomictlipan.

Uncompleted diorite masks taken from a ruin of a Nahua temple.

A collection of "money" in use by both the Maya and Nahua empires.



Races that have tried to rule Mexico. Left, a Tarahumara Indian; then a Spaniard; then a Huichol Indian, and, on the right, a Mexican of today.



Workmen opening a mound covering a ruined building.

Fallen block of gray diorite, either an idol or a historic record.

The ruin of Xochicalco (the "House of the Yellow Flower"), near Mexico City. The pen-and-ink drawings on this page are picture-writings of the early North American tribes.

The Law Is for All to Obey.

A NEW YORK CITY judge recently saw fit to commit to jail a member of the police force for an assault upon a civilian. In so doing he called timely attention to the growing tendency of police officers to overstep the limits of their authority.

Nothing breeds greater disrespect for the law than lawlessness on the part of the agencies charged with enforcing it. Minor courts in some of the larger cities have brought undeserved criticism upon the entire institution of courts, because of the misguided efforts of a few incumbents of the bench. Police departments in nearly all the large cities have acquired disfavor from similar causes.

Too great zeal in the punishment for crime is at least as harmful as too great laxness. The American idea has always been that it is better to err on the side of mercy than on the side of injustice. The maxim that it is better to allow 99 guilty persons to escape than to inflict punishment wrongfully in one case, is as wise in these days of so-called crime waves, as it was in the most piping times of peacefulness.

In American cities, courts and police departments alike owe their continuance to some sort of political favor. New or shallow incumbents of the bench or heads of police departments are apt to cater to public favor by going sled-length in the enforcement of some measure which attracts momentary popular interest. In a few cities, where the tremendous power of some newspapers has inflicted an invisible government upon the municipalities, the activity of courts and police is especially dangerous.

It is a human failing for a man to become intoxicated with power. Rare indeed is the individual who will exercise with forbearance newly-imposed powers. Police officers have been prone to exceed their lawful duties. Too often they look upon the club as their wand of authority to be waved and wielded on slight provocation, rather than for use as a last resort. Too often they speak in the rough tone of command, rather than with the calm persuasiveness which appeals to American reasonableness. It has been a fault of American police organization that men are arrayed with the garb of authority without having been instructed in the way it should be worn.

The age of the mailed fist is gone. Police should be taught that the quiet, courteous word of direction, rather than the truculent voice of command, is more readily heeded by Americans. Capable police officers will lose none of their power to meet emergencies with force, through the conservation of that quality.

It lies with the proper municipal officials to restrain the unbridled exercise of authority by police officers. An added sense of responsibility is needed by some of the judges. Lawful enforcement of the law is imperative.

Hyacinths and the Boy

THE story is told of a 10-year-old boy who was given 50 cents by his mother to buy meat for supper on his way home from school. On his way to school, he was attracted by the hyacinths in a florist's window. He promptly gave up his half-dollar for the flowers and presented them to his teacher.

All this took place in Chicago! Lest the recital should tax credulity, we hasten to add the epilogue. When he got home, in lieu of producing the fifty-cents' worth of boiling beef, he proudly told his mother what he had done with the money. He was soundly and properly spanked.

There may be exalted and sensitive souls who will weep at this apparent anticlimax. "If you have two loaves of bread," said Elbert Hubbard, "sell one and buy hyacinths to feed your soul!" Acting unconsciously on this advice, the Chicago boy gaily and gallantly sacrificed not merely the price of one loaf of bread, but the entire family supper to feed his soul—to express his inner and finer nature. As there is no glory gained without suffering and sacrifice, the spanking was the one thing necessary to give the proper glamour to the episode. By and by it may be that he will not only count his mother's half-dollar as well spent, but the spanking as worth all it cost.

Who knows but that one such child of pure and unspoiled impulse, spontaneously "buying hyacinths to feed his soul," may one of these days save even Chicago.

New Brooms and Waste

THE announcement of President Harding that a direct saving of $32,000,000 and an indirect saving of $104,000,000 has been accomplished in less than six months through the operation of the budget system is pleasing.

That more may be saved seems undoubted. The first six months' savings are laid to the co-ordinating agencies established by Charles G. Dawes, the director of the budget. There has been considerable friction with department heads, and much reluctance on the part of old department employes to abandon time-honored red tape in methods of purchases. Mr. Dawes' assertion that the Navy Department purchased 18,000 brooms to comply with technical departmental specifications rather than choose from 340,000 brooms the War Department had to give away, is abundant proof that there is much more to be done in co-ordination.

There is danger, of course, that the new agencies of the budget bureau may become in time calloused to existing conditions in other departments. Vigilance from individuals, not accustomed to accept things as they are, is necessary that year by year the wastes and absurdities of governmental routine may be eliminated.

The real test of the budget bureau during the present taxation crisis will come with the summing up of the appropriation work during the present session of Congress. Some of the congressional committees have shown commendable intentions in reducing estimates below the figures suggested by the budget bureau. However, a failure to grant necessary appropriations is as gross an error as is extravagance. Whether the cuts made by the congressional committees will prove to be wise thrift or costly parsimony depends on the measure of judgment used by the two bodies.

Out of the Frying Pan

BRIAND was bad enough as protagonist of the French militaristic machine; but Poincare is a thousand times worse. Largely responsible for the Franco-Russian Entente and for incitement to Russian belligerency in the years immediately preceding the war, it has been revealed since he stepped down from the presidency of the French Republic that M. Poincare more than once blocked hopeful attempts to end the war in its earlier stages.

France has jumped out of the frying pan into the fire. A government headed by Poincare means a government so blatantly and blindly militaristic as to push the republic over the verge of isolation reached by Briand's policy. It means heading the nation for destruction.

One hope for France is that Briand—chastened by realization of the roorback caused by his Washington speech—may prove more powerful in opposition than in power.

The Farmer's Plight

THE following table has been prepared by a Nebraska farmer of a statistical turn of mind, and shows the amount of taxes, in terms of corn, his farm has paid for 10 years, the market price taken for a basis being that quoted by the Department of Agriculture for December 1 of each year. The figures speak eloquently of the real trouble with agriculture.

Year	State Taxes	Price Corn	Bushels Corn
1912	$ 8.11	$ .37	22
1913	12.16	.65	19
1914	12.16	.53	23
1915	10.60	.47	23
1916	14.14	.78	18
1917	19.67	1.20	16
1918	17.81	1.28	14
1919	30.55	1.23	25
1920	26.82	.41	65
1921	42.90	.30	143

It took more corn to pay taxes in 1921 than for all the five preceding years. The table also shows the increase of the tax levy in dollars.

Perhaps the foregoing reveals why the farmer hearkens to the call of organization.

Can It Be Justified?

FOR several weeks a United States Senate committee has been engaged in a fruitless investigation. Investigations are failings of Congress, but one which from the outset offered less probability of good results than the inquiry into unauthorized executions in the American Expeditionary Forces cannot be imagined.

The public has been regaled with evidence, much of a contradictory sort, dealing with deaths under stress at the battle front and under unusual conditions in the service of supply. The rules—if such they be called—of war have differed widely in each conflict between nations. A measure which in one war is considered routine discipline may in the next be looked upon as a relic of barbarism. It would be a daring man, indeed, who would attempt to define a good war. In the World War, the ideas of commanding officers in various units differed as to the severity of the measures necessary to war-time discipline. It is charged that some of these officers went to the length of causing death.

Without considering the merits of the moot question as to the justification for such measures, it must be admitted that responsibility in each case was individual. It is the same in offenses against life and property in civil life.

The Senate investigators do not seem to be considering the general question of the justification for the severest war-time disciplinary measures. Their inquiry simply aims to learn whether individual executions without all the formalities of law did occur.

Just what the proponents of the investigation believe they will have accomplished when they have completed their investigation is beyond comprehension. There can be little or no expectation that those responsible for unjustifiable executions will be brought to trial. The practical and legal difficulties due to restored peace, discharged armies, forgotten evidence and changed viewpoints, seem insurmountable.

Little can be expected from the investigation except the reopening of old wounds and the making of new ones.

In a few cases testimony has been produced of the deaths of a few American soldiers on the scaffold and at the hands of a firing squad for murder or other crimes. The names of these men have appeared in the press. Mothers who with solemn pride had hung gold stars in their windows for sons they believed had fallen in battle—*kindly misinformation from American commanding officers, by the way, which will not draw the Senate committee's commendation*—now have learned for the first time and to their lasting sorrow that those sons died dastards' rather than heroes' deaths.

Who can forgive the Senator whose ill-considered and useless investigatorial ardor has inflicted these lifelong wounds?

The Decline of College Humor

IF IT is true that students of Northwestern University have protested against the quality of humor served up in college publications, they have started something which should go the round of the universities. A recent survey of publications from colleges in all parts of the country—a survey made for other than editorial purposes—disclosed a most surprising paucity of clean humor and a dirty deluge of the most disgusting form of acute primary moral dementia precox. The spirit of college fun seems utterly to have departed, and the dregs set up in its place. Cleverness in writing around every type of salacious and suggestive vulgarity has taken the place of the wild exuberance of imagination, the perfectly irresponsible riot of wholesome sportiveness which marked college journalism in its prime.

It is a rather humiliating discovery to make. Many people who imagine that they know what the ruling spirits of the campus are thinking about, would do well to gather up a dozen of the student publications of the best universities and colleges, and hold a clinic on them. Thoughtful people are justly perturbed by the disappearance of sympathy and understanding between the social groups now bearing the burden of the world, but if the college student publications are to be taken as an indication, the rift between the campus and society is one calling for more particular attention.

Making all allowance for the rickety mental supports of youth, and for the traditional devil-take-it attitude of very young collegians, there is in some of our college publications a lack of breeding, yes, of yokel wholesomeness, yes, even of a polite libertine's regard for decent appearances, which would rouse the protest of parents if those publications ever reached the students' homes, and should have brought the action of college authorities long ago.

This goes for some high school publications, too.

Winter Adds New Pathos to Indian Appeal

With 80 per cent of the Blackfeet Destitute, Robert Hamilton Renews Fight in Washington to Help His People, Victims of Those Named to Aid Them

THE DEARBORN INDEPENDENT some months ago published an article by Mr. Christmas which first called attention to the plight of the Blackfeet. The Blackfeet are not the only Indian wards of the Government who suffer from Bureaucratic methods, but their case is so pitiable that these new developments are presented in the hope that Congress may be induced to take cognizance of the situation. The columns of some eastern publications have been too filled with appeals for starving Europeans to take an interest in the Indian situation in their own country. Of course, the Indians haven't any relatives who control advertising appropriations.

By EARL CHRISTMAS

ROBERT J. HAMILTON has gone to Washington again—the lone envoy of a destitute people.

Hamilton is a Blackfeet Indian and is president of the Business Council of the tribe. For 20 years, he has been fighting the cause of the Blackfeet, seeking to obtain satisfaction of their claims against the government or endeavoring to get relief from their destitute circumstances.

A graduate of Carlisle, Hamilton has been one of the most active leaders of the Blackfeet. Time and again, he has appealed to the authorities at Washington in their behalf. It has been a long and discouraging fight. But, spurred on by the suffering among his people induced by a severe winter on the reservation, he has taken up the fight at Washington again.

Though once a numerous people and the possessors of a vast territory, the Blackfeet Indians, now crowded back to a small and unproductive region at the very foothills of the Rocky Mountains, virtually are at the point of starvation, according to Hamilton. The Blackfeet Indians claim that the government owes them for some 30,000,000 acres of land, taken unjustly at different times. Yet, they can't get enough to eat, Hamilton says. And this in a land where the Indian once was the sole possessor, and none contested his right! Certainly time and the white man have brought changes to the land of the red man.

"Right now conditions on the reservation are deplorable," Mr. Hamilton said. "More than 80 per cent of the full-bloods have no employment, no income and no resources within their reach. Wholesale starvation is facing the whole tribe unless action is taken immediately.

"The severe weather of the winter and the destitution have made conditions for the Indians terrible, and there seems to be no prospect of relief. More than 80 per cent of the dry-land farmers in the territory surrounding the reservation have left the state, bankrupt. When these men, who are footloose and able to get around to help themselves, have failed this way what can you expect of a tribe of Indians whose hands are tied with red tape and whose property is held under a guardianship that isn't always friendly?

"The land where most of the Blackfeet Indians live is 5,000 feet above the sea level. Much of it is rocky, and fit only for raising cattle. The seasons are very short and crops can be raised only with great difficulty. Often, there are seven months of severe winter weather, and the suffering of the Indians during these winters often is intense. Many of them have only poor homes as protection from the elements. The majority of the Indians have lost all their cows and horses, and are absolutely without means.

"The Indians have gone hungry, some of them have starved and all have suffered for the want of proper clothing. Even the horses have starved. Many of the Indians have lived only upon the hay they sold. Indians have cut hay with old machines which white people have thrown away. They have raked the hay with broken rakes, some without wheels. Some have raked the hay by hand and hauled it as much as 35 miles to sell it. It was very little pay that they got for their work, but it was the only means they had. Others have had to sell their last horses and cows to get food.

"Last year, Mr. F. C. Campbell, the present superintendent at the reservation, did what he could to improve the conditions of the Indians. He made them farm little gardens and raise a little wheat, but this was not enough to last all winter. If the superintendent could exercise his own judgment, he could improve conditions, but he is bound and tied by the red tape issued in Washington instructions.

"Right now, the Blackfeet simply are facing a panic. Though 80 per cent of these Indians have no income, nothing had been done in the way of general relief when I left the reservation a few weeks ago. Commissioner Burke has promised me that he will ask for an emergency appropriation, but whether Congress will accede to that request, I do not know. That always has been the trouble—to get Congress to see that Indians can starve.

"Rations are issued to a limited extent by the government, but to qualify for those rations you have to be old, decrepit, poor, blind, sick, have no friends or relatives, no place to sleep, no stock and an absolutely unproductive allotment. Those who qualify get flour and meat once in two weeks, not enough for two days. They receive sugar, coffee, tea, beans, rice, bacon and other stuff once a month—about enough for one or two meals. Sometimes Indians have been told that their requests for rations would have to be referred to Washington, and it would be long periods before they would get relief.

"The government's handling of the affairs of the Blackfeet Indians has added immeasurably to their hardships in many ways. One of the greatest abuses is that connected with the leasing of the lands of the Indians. The Blackfeet have lost large sums because their interests have not been properly protected in the making of leases for their lands.

"Cattle have been brought into the reservation and grazed on lands of the Indians without payment. Persons who leased lands have been allowed to default on their payments. This condition got so bad that on November 23, 1921, the Business Council of the tribe adopted a resolution canceling all leases that were delinquent. These delinquencies amounted to an aggregate of $59,459.27.

"The delinquencies range from one to three years, although the regulations require that these payments must be made six months in advance. Every one of these leases has failed, and most of them have been foreclosed. After the stock, which was good for the lease money, was taken away, the government got busy and tried to collect the money. But this was a case of locking the barn after the horse was stolen. A cattleman obtained a lease for a large tract of land belonging to some 40 Indians. He failed to pay his rent. The Indians warned the superintendent then in charge. The superintendent did nothing, and allowed the lessee to take his cattle to Canada. Then he said he could do nothing to collect the money. Yet, it is the duty of the superintendent to require a bond to protect the interests of the Indian.

"That shows how the Indian has been sacrificed to benefit wealthy cattlemen.

"The prevailing rate for grazing lands on the reservation has been 10 cents an acre, and the prevailing rate for agricultural lands 25 cents an acre. Yet outside the reservation agricultural lands inferior to those on the reservation were being leased from $2 to $10 an acre, and grazing lands for as much as $3 a head per month. The Business Council has protested many times to the unfairness of this discrimination, but all to no avail. In some cases, lands under irrigation have been leased at the minimum grazing rate of 10 cents, instead of at the higher rate for farm lands.

"Mrs. Amelia Fox, 84 years old, had a home on an allotment of 320 acres. She had a four-room house, a barn, running water with irrigation ditches and a good timothy field. The place should have rented for $1,200 a year, but an Indian Bureau agent leased it for $100. This woman is nearly blind and cannot read. An interpreter came to her and got her to make her mark. She says she was told to make her thumb mark on it and she would get some money. The next thing she knew she was ordered out of her home. She had no place to go, and now she is living with a niece.

"The Indian Bureau had the incident investigated, but the man we hold responsible for the wrong did the investigating.

"A daughter of another woman was induced to sign a lease for the lands of that family, totaling 1,920 acres, with improvements, for $132.

"Mrs. Alice Martin was declared a competent person, and was presumed to be able to conduct her own affairs. But officials led her to believe that she had to have her property leased. A woman lease clerk who induced her to lease made it out to her brother, who was then acquiring a very large area of lands on the reservation.

"That shows how the system has worked. Though sworn to protect the interest of the Indians, agents have worked hand-in-glove with the men who want our lands for as little as possible. It is only fair to say that this happened before the present superintendent took charge of the agency. Mr. Campbell has tried to help the Indians, tied though his hands have been with red tape at Washington.

"Grazing lands of the individual Indians have been taken for the tribal herd without compensation. One man was putting up hay, when the herd began destroying his stacks. He appealed to the government man in charge of the herd to drive the cattle away, and was told he would have to see the superintendent, 30 miles away. The Indian drove the cattle away, and the government confiscated his hay, saying that his lease had been taken for the tribal herd, although the owner knew nothing of a lease.

"Persons outside the reservation have offered to lease our lands for more than the regulation rates. One man wanted to start a big beet-raising enterprise. Others have offered to pay substantial royalties for coal or oil leases. But these efforts at development have not been approved by the Indian Bureau. The opening up of mines and the development of beet raising would give employment to large numbers who are now unable to find work. The Indians are restrained to the reservation, but still they have not been allowed to benefit from the resources there. Though without work or means of support, the Indian is expected to stay on the reservation, and starve or eke out a miserable existence as a pauper."

(Concluded on page 13)

ROBERT J. HAMILTON,

President of the Business Council of the Blackfeet Indians, who is in Washington renewing his long fight in behalf of the tribe.

The Guernsey Market House: a Story of Finance

Century of Progress Built Currency Without Metallic Basis; Channel Island Devoid of Apparent Poverty and Great Wealth

By HERJULF VIKINGSSON

GLADSTONE, we are told, once said: "The surest way to get into an insane asylum is to study the money question." I have asked American journalists why they do not write on sound finance. In reply they hold up their hands in holy horror exclaiming: "Too deep for *me!*"

These more or less intelligent gentlemen, who do not hesitate to discourse on international questions, analyze labor controversies, lash transgressors of stupid laws, or apotheosize a Grand Marshal of Finance, cannot, or will not, or dare not dig to the tap root of most of our social ills; our perverted money system.

If they but would, they would find the fundamentals of finance as simple as putting on their hats—it is the cunningly devised superstructure of *abuse* which is so difficult to understand.

The elemental simplicity of this very necessary adjunct to a convenient exchange of commodities appeals to common sense and delights the mind; the artificial intricacies with which it has been surrounded hinders penetration and discourages the mind. The first step in extricating ourselves from financial bondage is to comprehend the elements of exchange and taxation. It requires no intense study; the story of the Guernsey Market House will at once enter your understanding, will you but read:

It was after the close of the Napoleonic wars, that the "States of Guernsey" resolved to build a market house at St. Peters Port, the capital city of the island. The object was to provide a shelter for the farmer and a convenience to the citizen on market day, which was, and still is, Saturday.

Wealth Without the Money Gauge

THE problem was, as usual, "to get the money." There was no money in circulation; in fact, the war had drained the island of its coin, so there was none to circulate. In other words, there had been a "contraction of the currency," as now, after the World War.

A committee was sent to the governor, to ask if he could negotiate a loan for the city in Paris or London. The governor thought he could; but, said he, you will have interest to pay. Of course, they did not expect to borrow money without paying interest.

But, said the governor again, do you conceive that, when you have built the market, you will wish to do other things: build the sorely needed sea-wall or repair your almost impassable roads, and that such projects would necessitate additional loans, meaning a continuous increase of debt and interest, from which you will never be able to free yourselves? Well, yes, they supposed so—but was there any other way?

Before answering your questions, the governor replied, I wish to ask you a few:

Have you any granite for the foundation?

Yes, at St. Sampson (another city of the island).

Have you brick for the building?

We have the clay to make it from.

Have you lumber for finishing?

Yes.

Have you masons, bricklayers and carpenters to do the work?

Why, yes, your Excellency; why do you ask these questions? You know that we have all these things and that starting such public work would be a godsend to our idle workmen.

They Have Money to Burn

WELL, the governor said, I merely wanted to impress upon you the fact that you have all that is needful to build a market house.

Yes, the committee assented, *all except the money.*

Exactly so, said the governor; now suppose that we print the money?

Can that be done? asked the citizens in astonishment.

Would you be willing to try? queried the governor.

But would there be no danger of an over-issue and consequent "depreciation of the currency"? counter-queried the citizens.

No, said the governor, we will make a careful estimate of the cost, and issue money to the amount of the estimate: then we will levy a tax in the same amount and spread it over a convenient period of time. By the payment of this tax, the money will be returned to its source of issue; and, having performed the function for which it was printed and issued, it may then be destroyed

The idea of the destruction of the retired currency seemed a satisfactory safeguard against inflation and the committee requested the governor to put his plan in execution.

The money was printed and issued in payment of material, labor and supervision, and the market house was built. Meantime, the money circulated from the quarry owner and brick maker to their laborers and from these, as well as from the workmen engaged in building the market house, it passed to the grocer, butcher, baker, tailor, and dry goods merchant; all of whom paid their share of this money to the government in the form of taxes.

At the end of the stipulated period of circulation, when the market house issue was returned to the treasury, the governor proclaimed a holiday—to burn the money as per agreement with the committee.

The people assembled in the market house square, where the governor made a speech, reciting the conception of the plan to finance the erection of the market house, and explaining the service which this paper money had performed. Thereupon a fire was kindled, and the governor, after sprinkling incense on the money, consigned it to the flames.

When the charred flakes had curled and rolled away, the governor asked: Well, citizens, what do you wish to do next?

Tear down the old houses along Fountain street, and rebuild, responded the people.

Said the governor: Too bad that we burned the money, we could have used it again, could we not?

That's so, assented the citizens.

Well, said the governor, it is all right; I merely wanted to demonstrate to you that there is no danger of an over-issue or in a re-issue of currency *if honestly done for honest purposes.* We will print another issue: the loss, after all, is only the cost of paper and printing.

And so, issue after issue was made of this paper money, without a gold or silver reserve behind it. It *rebuilt* Fountain street; *erected* the sea wall; *built* a fine harbor; *maintained* an extensive network of splendid roads; and *performed* other works of necessity, utility and beautification.

For a hundred years this paper money has continued to circulate, without a metallic basis, and yet has performed all the functions which human need and progress require of it.

The Bank of England's notes have, except for the period of suspicion which followed the first issue, generally been regarded "as good as gold"—whether they are, is merely a question of convenience and utility. To ascertain what the Guernsey man thinks of *his* money, you may offer him payment in his own currency and he will be satisfied with 20 shillings to the pound; offer him Bank of England's notes and he will demand an extra shilling for each pound sterling. I do not say this to discredit the Bank of England's note issues (they are as good or as bad as any other promissory notes); I merely wish to demonstrate that the Guernsey money is entirely satisfactory to the Guernsey man. By a little story, I will show that it was deemed good enough also for the inhabitants of another island.

Prosperity Not Built Upon Gold

IN 1913, on a trip to Europe, I landed at Cherbourg, whence I took a local steamer for Guernsey, making an intermediary landing at Alderney, another of the British Channel Isles. The object of my visit to Guernsey was to observe the general conditions prevailing on the island and thereby determine the effect of their money system, at least on appearances.

I found their streets clean and in good condition; their houses in repair and painted; the store windows scrupulously clean, fronts painted, and in some instances grained and varnished. The combined hospital and home for the aged and infirm was surrounded by a park and formed the most beautiful portion of the city. There was apparently no poverty and no vulgar ostentation of wealth; for the elegant ladies, with whom we dined at the government house on Friday, greeted us at the market house, basket in hand, on Saturday. The road system of the island was ample and in excellent condition.

In my quest for information, I approached also those from whom I could expect adverse opinions. One of these was an Englishman.

"Mr. K.," said I, "what do you think of your money system?"

"That," he replied, "is most remarkable. I came to Guernsey 14 years ago to engage in the cattle trade. To the north is another island named Alderney. I was told the islanders had some very fine cattle, and went there to look it over. I found the island in a deplorable state; no activity of any kind. Peter owed Paul, Paul owed Thomas, and Thomas owed Andrew. Everybody was in debt to everybody else, and no one had anything to pay with; all were despondent and sullen.

"I opened conversation by saying: 'You have some nice cattle here, and, if you will register it, so that it may be pedigreed, I will buy from you.' Well, they had no objection to that, if thereby they could sell the cattle, and I helped them open a register. I also bought cattle to the amount of 1,000 pounds, paying for it in Guernsey notes. I then departed and returned in five days to ship the cattle. But what a transformation! The island was all activity. Peter had paid Paul; Paul had paid Thomas, and Thomas had settled with Andrew; they were out of debt, everybody was doing something, and all were happy. And, the remarkable thing about it is that these debts were paid and the islanders set in activity by means of the paper money of another island."

I am not certain that Mr. K. understood the philosophy of it; for he seemed to regard the manifestation as a phenomenon. But he knew that it worked.

I had several conferences with the treasurer of the island, from whom I ascertained that they had no difficulty in obtaining gold for the settlement of their foreign trade balances, as their exports always exceeded their imports; in other words, they lived within their national means.

When Norway, Sweden and Denmark, in the early seventies, adopted the metric system, they also agreed upon a mutual denomination and standard of money, to facilitate accounting of transactions between the three countries. Until the World War, the currencies, coin as well as paper, circulated with equal freedom in either country. Neither thought of refusing the coin or notes of the other. Periodically the accumulated bank notes were bundled up and returned to the country of issue, only to repeat their round regardless of political boundaries. I am sure it has already dawned upon the reader that there is only one more step to international currency.

Shipping of Gold Pure Waste

THE lesson which this story teaches is obvious, but I will nevertheless summarize it as follows:

1. The Metallic Basis: The theory that a gold or silver reserve is a necessity is only a myth held up before the masses to be revered as a religion the mandates of which are impossible of performance, because there is not sufficient gold in existence to discharge the debts made payable in that metal. Gold and silver, except as subsidiary coin, have long ago ceased to circulate, because of their inconvenience and quantitative inadequacy. These metals are used as "reserves" in obedience to an unnecessary law, passed to compel reverence for the fetish of the gold standard. It is also used to settle international trade balances, which could as well be adjusted by international currency, just as domestic bank balances are sometimes settled by clearing house certificates. If gold were demonetized, the cost of its transportation forth and back over the oceans would be saved, and the metal would come into its own as inexpensive fillings for defective teeth, personal adornments, ornamentations pleasing to the eye, and for numerous other purposes requiring non-corrosive material or permanence of appearance.

2. Over-Issue: If the issue of paper money is confined to legitimate, that is, constructive purposes, there can be no danger of an over-issue, because it is paid out for material, labor, or other services, and as the volume issued is based upon the estimated cost of work to be performed, it logically follows that, as the performance of the work depends on the number of hands available, so the issue of currency is limited accordingly; but is, nevertheless, always adequate.

Constructive Taxation Bar to Inflation

3. Depreciation: For each issue of money, a corresponding tax is levied, which is paid periodically; and, when the last installment is returned, the issue may be said to have been withdrawn from circulation. It has served the purposes for which it was issued and is returned to its source, having completed the circuit of exchange; while other issues for other purposes continue to circulate until their specific objects have been attained and their usefulness ended. The tax-levy thus becomes the controller of the currency and inflation is prevented; *unless*—money is issued for destructive purposes, as war, which is avoidable; and speculation, in which governments would have no incentive to indulge.

4. Adequacy and Elasticity: There would always be a sufficiency of the circulating medium because each project would be financed by its specific issue, which by its free circulation unhampered by private privilege of control, would serve in all individual transactions arising as subsidiaries to the project for which the issue was made, including the personal needs of those engaged in its execution. The elasticity is automatic, as the system provides expansion when new work is projected and contraction when it is completed.

It is obvious what an impetus this system would give to individual enterprise in science, art, invention and other fields of human endeavor. There would be no national debts, and the money with which to pay taxes would always be in the hands of the people.

Money is only popular bookkeeping; it is accounting reduced to its simplest form.

One Set of Feathers

By JAMES LANE ALLEN

THE birds are moulting. If man could only moult also—his mind once a year its errors, his heart once a year its useless passions! How fine we should all look if every August the old plumage of our natures would drop out and be blown away, and fresh quills take the vacant places! But we have one set of feathers to last us through our threescore years and ten—one set of spotless feathers, which we are told to keep spotless though all our lives in a dirty world. If one gets broken, broken it stays; if one gets blackened, nothing will cleanse it. No doubt we shall all fly home at last, like a flock of pigeons that were once turned loose snow-white from the sky, and made to descend and fight one another and fight everything else for a poor living amid soot and mire. If then the hand of the unseen Fancier is stretched forth to draw us in, how can he possibly smite any of us, or cast us away, because we came back to him black and blue with bruises and besmudged and bedraggled past all recognition? —From "A Kentucky Cardinal."

Pictures the Life of Kentucky

By FRED. L. HOLMES

JAMES LANE ALLEN is almost an institution in Kentucky. He has written so much about the people of that state; portrayed with the touch of his genius the chivalry, tenderness and love of the true Kentuckians that in recent years the schools of Lexington, where he was born and lived, have made his birthday a holiday. It is to be an annual event. Since the death of James Whitcomb Riley, Mr. Allen is the only living American author whose birthday is celebrated in the schools.

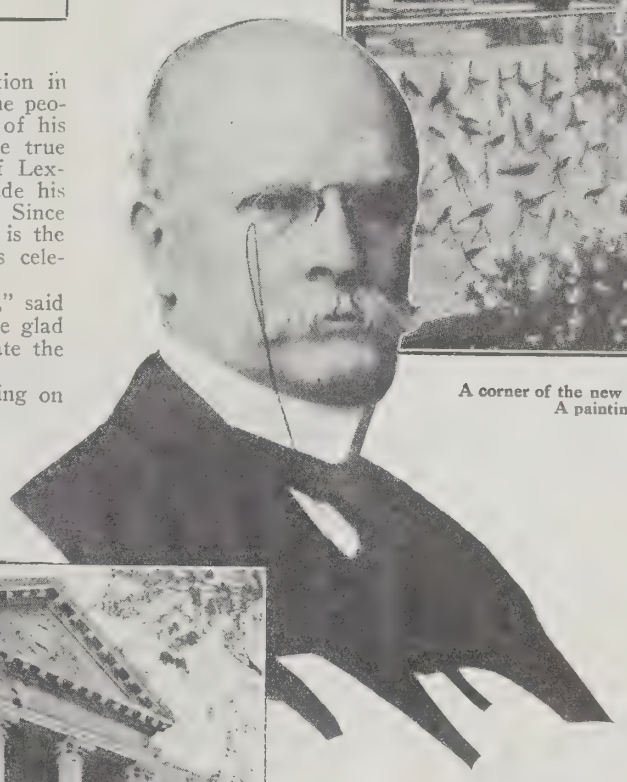
"I am embarrassed at receiving this attention," said Mr. Allen recently, "but I know that children are glad to have a rest from their classes and I appreciate the interest they are taking in me."

Past 72 years, he announces that he is working on the greatest book he has yet written, for be it known that in our day the Biblical limitation of threescore years and ten no longer holds—no more for authors than business men. Dr. Charles W. Eliot is 87; Lyman Abbott is 86; Justice Oliver Wendell Holmes is 80; the Rev. Russell H. Conwell is 78; Sarah Bernhardt is 76, and Thomas A. Edison is 74. These and many more who are older than Mr. Allen are still active.

Over the life of Kentucky, Mr. Allen has hung garlands of mystery and romance that will make the Old South live in the literature of the land for ages to come. Lexington, pungent as resinous wood with the memories of Daniel Boone, Henry Clay, John James Audubon, the naturalist, and scores of other historic men, was lifted from literary obscurity by this farm boy, who spent his early life amid the scenes of slavery and in the hardships of the hemp fields. He has done for Kentucky what Washington Irving did for the valley of the Hudson and George W. Cable for the scenic French-American life of New Orleans.

I asked the editor of the Lexington *Leader* for the names of some of Mr. Allen's old friends. I wanted information about his early life, for in books of biography the notice which he has given of himself is about as brief as that other Kentuckian, Abraham Lincoln, in the Congressional Directory, when he first went to Congress—one good sentence.

"See M. A. Cassidy, superintendent of schools, who has known him more than 30 years," was the direction. "When Mr. Allen folded up his papers as a college professor, back in 1886, to devote his life to literature, Mr. Cassidy was one of the few men who predicted that this young man would glorify the commonwealth of Kentucky among civilized people."

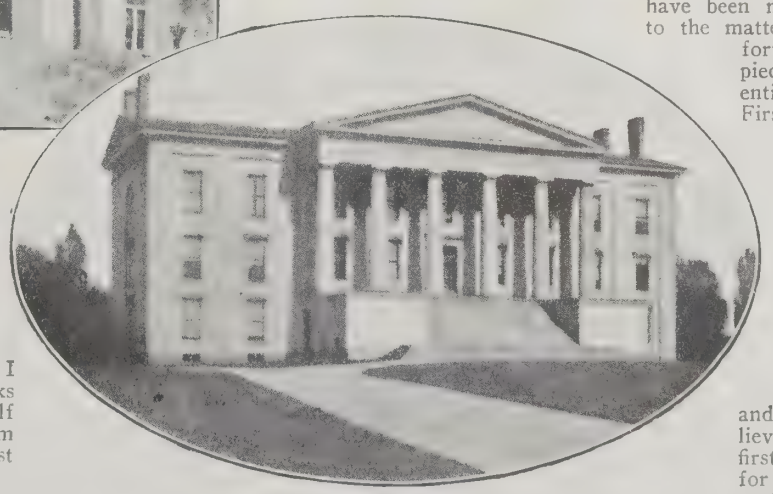


When I sought Mr. Cassidy for information the 8,000 children of Lexington had just been holding a birthday celebration for the author, who left 35 years before for New York to follow literary work, there to paint again and again the scenes of his boyhood and young manhood. He showed me a letter written by Mr. Allen shortly before, a copy of which, written on parchment, has been hung in the halls of every school in the city. Here it is:

"To the children of the Lexington public schools.

"Your loved and honored superintendent, Mr. Cassidy, who cannot have been a friend of yours as long as he has been a friend of mine, lets me know that you have set apart one day of this December as an honor for my birthday and as a tribute of appreciation to my work. Thus, though you are all strangers to me, I am made aware that you have become my friends through our common interest in what no one of us can ever hold too dear—the literature of Kentucky. And since thus early in your young lives, under the guidance of wise teachers, you have been led to the study of this young literature and have, meantime, been reminded not to forget gratefully to acclaim those who have tried to create it, I can send back to you in happy acknowledgement of your happy greeting, no better wish for your own birthdays in maturer years than that these may find you still pursuing the study that you have now made your own.

A corner of the new public library at Lexington, Kentucky, is devoted to James Lane Allen. A painting of Mr. Allen hangs on the wall; his writings are on the table.



JAMES LANE ALLEN

Only living American author whose birthday is observed in the schools.

The new public library at Lexington, a corner of which has been devoted to Mr. Allen.

Transylvania, Lexington, first institution of higher education west of the Alleghanies and where James Lane Allen was educated and taught.

"May there originate with you some movement, at least may there prevail among you the desire, to make the literature of Kentucky more and more, if possible, the first wealth of the commonwealth, the crowning, and imperishable glory of the state; some of you nobly helping to create it and all of you nobly eager to honor and guard.

"As for my birthday and what you have done to honor it, accept each and all of you the pledge of my life—long and most affectionate remembrance. It is as if you had taken up a plant amid the deepening snows of the winter solstice and set it in a constant spring.

"Your friend,
"James Lane Allen."

Born near Lexington, December 21, 1849, Mr. Allen was educated at Transylvania University. On his father's farm, a fragment of a once large estate, on one of those numerous Kentucky limestone highways not far from Lexington, he harvested, cradled, shucked corn and broke hemp stalks, becoming every day more conscious of the landscape about him, and the Blue-Grass country, that was later to play so important a part in his life. The year he finished college also saw him placed at the head of a family of three, for his father had died, leaving a wreck in the family fortunes following the war. He sought employment as a teacher, taught in public and private schools, served on the faculty of Kentucky University and filled the chair of Latin and higher English in Bethany College, West Virginia.

The chance reading of a book written by Henry James, with which he could not agree, was the thread that changed the course of his serene life and sent him into literature.

"It was altogether in the pedagogic nature of things," says Mr. Allen, now living in New York, in recently explaining the matter, "when one night that I entered upon the reading of Mr. James' novel, 'The Portrait of a Lady,' for me to discover on the first page that I did not approve of the way in which the author had written it. Not a line of fiction had I ever written; but the fact in nowise interfered with the conviction that Mr. James, with his genius, art, care, and experience combined, had not opened his novel quite so well as I could have opened it myself.

"In those distressing, dogmatic years, such must have been my own folly and infatuation as related to the matter in hand, for putting pen to paper, I forthwith demonstrated how imperfect as a piece of literary art Mr. James' opening was, entitled my derisive, destructive essay, 'The First Page of The Portrait of a Lady,' and dropped my improvement into the mail.

"There flourished in the New York City of the period a literary weekly whose peculiar claim it was to offer its readers only such reviews as were prepared by expert authority. Perhaps its occasional activity might be described as that of fostering the criticism of distinguished attack. I regularly read this aggressive periodical, and to it naturally forwarded my distinguished attack on Mr. James. Promptly there reached me from the editorial office an acceptance and a check. 'I at once entered, as I believed, the timeless world of literature. The first thing that I had ever written and offered for publication had been accepted, paid for!'

Shortly afterward Mr. Allen gave up teaching and went to New York to follow literary paths. "The blond young giant" was what one of the editors called him on seeing the author of "Flute and Violin." And he is a regular giant, like his father, with great broad shoulders.

Such a shelf of books have since come from his pen: "Flute and Violin," 1891; "The Blue-Grass Region and Other Sketches of Kentucky," 1892; "John Gray—a Novel," 1893; "The Kentucky Cardinal," 1895; "Aftermath," 1896; "A Summer in Arcady," 1896; "The Choir Invisible," 1897 (Dramatized in 1899); "The Reign of Law"; "The Mettle of the Pasture"; "The Bride of the Mistletoe," 1909; "The Doctor's Christmas Eve," 1910; "The Heroine in Bronze," 1912; "The Last Christmas Tree," 1914; "Sword of Youth," 1915; "The Cathedral Singer," 1916; "Kentucky Warbler," 1918; "Emblems of Fidelity," 1919.

Two Years of Prohibition: An Official View

Enforcement Making Headway Despite Obstacles; Record Gives Lie to Propagandists Against the United States Constitution

By ROY A. HAYNES
FEDERAL PROHIBITION COMMISSIONER

IT HAS been estimated that there were 20,000,000 drinkers of alcoholic beverages in the United States before the country went dry. If there were 20,000,000 drinkers—which is doubtful—when liquor was accessible, one may safely take for granted that today there are 2,000,000 drinkers—a total which is also doubtful.

The ratio of one drinker today for ten drinkers two years ago, irrespective of grand totals, seems to me a safe one, at least to show what the Eighteenth Amendment has done. It is obvious that upon the estimates above stated, 18,000,000 former drinkers have quit drinking. This is a wonderful record.

Of the remainder, 1,000,000 or 1,500,000, are those who are in lawful possession of liquor acquired for home use before the prohibition law became effective, while the rest belong to that category of old drinkers who imbibe whenever they can get it.

Only 10 per cent, at most, of former drinkers are drinking now, and these are drinking but five per cent of the quantity of liquor that was formerly consumed. The entire drink bill of the nation has decreased $2,000,000,000 a year. Other results include the disappearance of the open saloon, abatement of open drinking in public dining rooms, passing of the treating evil, closing of establishments for the cure of alcoholism, increased savings accounts, decreased drunkenness, prohibitive price of bonded liquor for beverage use, dangerous character of illicit drinking, decreased importation of liquor, and an improvement in the national health, according to insurance companies.

Drunkenness in Big Cities Decreases

IN 59 cities, with a population of more than 30,000, and a combined population of 20,000,000 (including New York, Chicago and Philadelphia), official and estimated figures show a decrease in arrests for drunkenness from 316,842 in 1917 to 109,768, notwithstanding bad booze, temporary individual hard drinking and a zeal to "jug" all intoxicated people.

During the last fiscal year approximately 950,000 gallons of distilled liquor and wines were seized, and property seized (exclusive of property levied on for payment of taxes, or distillery apparatus or other property destroyed) was valued at $12,907,693. The miscellaneous seized property included automobiles, boats, wagons, carriages, horses, mules, airplanes, motorcycles, land, and so on.

It is becoming more clear every day that thinking persons favor the Eighteenth Amendment. The "personal liberty" argument is not as popular as it used to be. It is alleged that the Prohibition laws infringe upon personal liberty by restricting one's personal habits. Every law does that in a larger or smaller degree. The narcotic law greatly interferes with the personal habits of the drug addict, and the traffic laws seriously restrict the speed fiend, but these restrictions do not seriously limit the man who puts the community good above his self-indulgence, nor do they greatly embarrass the man who places the public welfare above his personal convenience.

Liberty is, after all, the restriction of personal habits by law for public good; and license, these same impulses unrestricted. Prohibition is a great movement for the public good, and all great movements are evolutionary. The idea of the men who enacted the Eighteenth Amendment was not that it would become an established fact in a moment. The law is slowly making its way by the method of attrition. The forces of law and order are gaining their objective. The progress is insistent, definite and sure, and decrees the final doom of the illegal liquor business.

Leniency Makes Bootlegger Defiant

THIS process of attrition accounts for 30,000 Federal indictments obtained last year. In 17,000 cases pleas of guilty were entered. The convictions totaled 21,000 and the acquittals 950. About 300 brewers were investigated and charged with violations of the law, several public officials were indicted and manufacturers of whisky from diverted alcohol prosecuted.

Of course, there are some outstanding obstacles which furnish considerable embarrassment to law enforcement work. There are some officials in the land who use their high positions to express their disdain of the Volstead Act. To me it seems that the officials in this country should take the matter of the Prohibition law seriously. It is their duty to administer justice. It is hardly within their province to exploit their own private opinions or prejudices officially. The Supreme Court of the United States has decided the constitutionality of the Volstead law, and that question should be considered settled.

In my judgment, light fines and delay in bringing cases to trial have contributed in no small way to the spirit of defiance in which bootleggers hold the law. Recently a bootlegger was questioned, and he said he had been arrested four times. He added, with a grin: "I always manage to get out all right." This, too, despite the fact that bootleggers generally deal in odd substances which the official chemists have reported as 98 per cent unfit to drink.

It would be very interesting reading if it were feasible to include a list of the arrests for bootlegging in order to ascertain how many of the bootleggers are second offenders. As long as public officials take an attitude hostile to law, it is going to be difficult to get juries to convict. The attitude of the judge and the prosecuting attorney has much to do with the verdict of the jury.

In some cases, I am told, it has been difficult for observers in court rooms to tell whether it is the bootlegger or Prohibition officer that is on trial. It has been suggested the attitude of such public officials might be changed if more of our better citizens would attend the courts. The friends of the bootlegger throng the court room, but the friends of the law remain away.

In other words, among the outstanding difficulties that have stood in the way of more rapid progress, is the apathetic citizen and the lethargic public official. Wherever there exists a favorable attitude on the part of courts and public officials charged with the duty of enforcing the law, and this attitude is shown, the Prohibition act is respected and made effective. Happily this condition is rapidly improving with the advent of the splendid pronouncements and co-operation from the Department of Justice.

While it is true that we also have our smuggling problems, we have our brewery problems, our distillery problems, our warehouse problems, our wholesalers' problems, our "moonshine" problems, and our home-brew problems, yet in my judgment the most serious task we have right now is to arouse this apathetic citizen and to disillusion a lot of perfectly good people who have been inoculated with a great mass of popular misconception and misinformation.

Let's face some facts.

The facts show that the total known importation during the last fiscal year was one-half of one per cent of the total consumption of liquor in America the year before Prohibition. The country is told that crimes are increasing and that the Prohibition law is the cause. We point to world conditions, and show that the crime wave in America is but the reflex of a world-wide crime wave. We show that arrests for drunkenness have decreased 60 per cent in America, and that convictions for drunkenness increased in about the same proportion in wet England.

That two conditions exist at the same time does not prove that they are related to each other's cause and effect. It is just as logical to charge that the crime wave is the result of woman suffrage as to say that it is caused by the adoption of the Prohibition law. We show that in the United States during the month of October, last, liquor withdrawals were only 50 per cent of the liquor withdrawn in October, 1920. We show that whisky withdrawals by wholesale druggists in New York for the months of September and October just passed totaled less than four per cent of such withdrawals as compared with the preceding months of June and July. We show that in the New York office under the reorganization the volume of routine business passing through the Permit Section has been reduced by two-thirds, indicating that real, sincere efforts to weed out illegitimate business can succeed.

Progress Is Being Made

THE fact of the matter is, such proofs constitute about all the argument that sincere, sensible people need to see that good progress is being made in a gigantic task. This is a new law. It was two years old on January 17, 1922. One hundred per cent enforcement is not expected. Who can recall one hundred per cent enforcement of any law, regardless of how long it has been operative? Yet those who are trying to cloud the issue give no credit for the fact that relatively great progress is being made. They pick up a rumor here and seize upon a fact there and try to make these fit into a general plan.

Indeed, it seems to me it is much fairer to take the statements of some of our own directors—of all officials concerned, in fact—who are operating in the midst of the problems and difficulties in an official way, rather than the cry of the propagandists who are trying to make out a case against the Constitution of the United States.

The Harding Administration fully recognizes the importance of law enforcement and is irrevocably committed to it. During the months since I took the oath of office of Federal Prohibition Commissioner, this administration has reorganized the Federal enforcement machinery of the United States. New plans of organization have been decided upon and put into operation; new directors have been installed in every state in the Union, having assumed full responsibility for the successful enforcement of the Volstead Act in their respective state areas; new rules and regulations have been promulgated, and with the inspiration of full confidence in the inherent patriotism of the American people this new organization is now taking good stride and is already showing excellent results.

That lawlessness in any community will last just as long as the community will stand for it is undeniable. The saloon brought on its own doom; so will bootlegging and other flagrant violations. A definite nuisance soon spells its own doom.

The violators of the Prohibition law in America today may largely be divided into two classes; the faddist drinkers, which is a temporary class, and those who have an appetite established through years of indulgence. Most of the latter class may be expected to use liquor as long as they live, either through supplies of liquor acquired before the law became effective or through illegal means.

The beginning of the operation of the law came at a time when the United States, in common with the rest of the world, was in the maelstrom of the aftermath of war. Because of the beneficence of this law, no nation in the world was or is so well fortified to stand the test of the strain to which moral fiber, financial and industrial structures, and government systems, have been subjected.

The fact of the matter is that there was never a law adopted so drastic as the Prohibition law, which has been so early and so successfully enforced. One authority announced recently it was estimated that the Prohibition law today was being 64 per cent enforced. If that be true it does not require any prophet to know that in a comparatively short time the law will be as successfully enforced as any other law on the statute books.

How many drunken men does one see walking down the streets of Chicago or New York or any large city, any morning or any afternoon or any night? I have been in large and small cities frequently the past few months, and I could count the drunken men I have seen on the fingers of one hand.

In the olden days they were to be seen on every street corner. Today it is dangerous to violate the law in the purchase of drink, and secondly, it is especially dangerous to drink the stuff after purchase. It is claimed that recently there is an increasing number of alcoholic cases at the hospitals that still remain open for the treatment of inebriates. That is to be expected. Only two per cent of the vile stuff that is being seized by our agents and analyzed is found to be free from the dangerous fusel oil poison. Those who buy and drink illicit liquor take long chances.

"Home Brew" Only a Passing Fad

THE talk one hears of drinking among the young people and in society, of home brewing and home distilling, has no doubt some basis of truth, but if this deplorable condition does exist to some extent it must be regarded as a national fad and craze, and not a permanently entrenched custom. It is a pathetic thing—even if only a fad—to hear of women who go about their homes shaking a cocktail mixer, thereby setting a reprehensible example to their households; as it is to hear of the business, professional or the club man who technically, and often unthoughtfully, violates the law, forgetful of the fact that the example he is setting is in reality dangerous to the very foundations of government itself. As for the home "manufacturers," it is reported that results secured are so much lacking in satisfaction that in most cases they are already saying, "Never again."

Commander Evangeline Booth of the Salvation Army—an organization that probably gets closer to the poor and the down-and-outs of the country than any other organization in our land, and therefore knows the effect of the liquor traffic as well as any organization can possibly know it—makes the most telling statement concerning the wonderful benefits of Prohibition since the enactment of the Eighteenth Amendment.

Commander Booth says that the population in penal institutions is reduced; that many jails are converted into dwelling apartments, and prisons turned into schools and social centers. She states that Prohibition has improved health and reduced mortality in the country. In the city of Boston during the year deaths by accident dropped one-third, deaths from suicide one-fifth, and deaths from alcoholism 79 per cent. She adds that the homes in the slums are immensely improved, and in place of the bread lines the men now support their families and increase their bank accounts.

Appeals to the Press and Stage

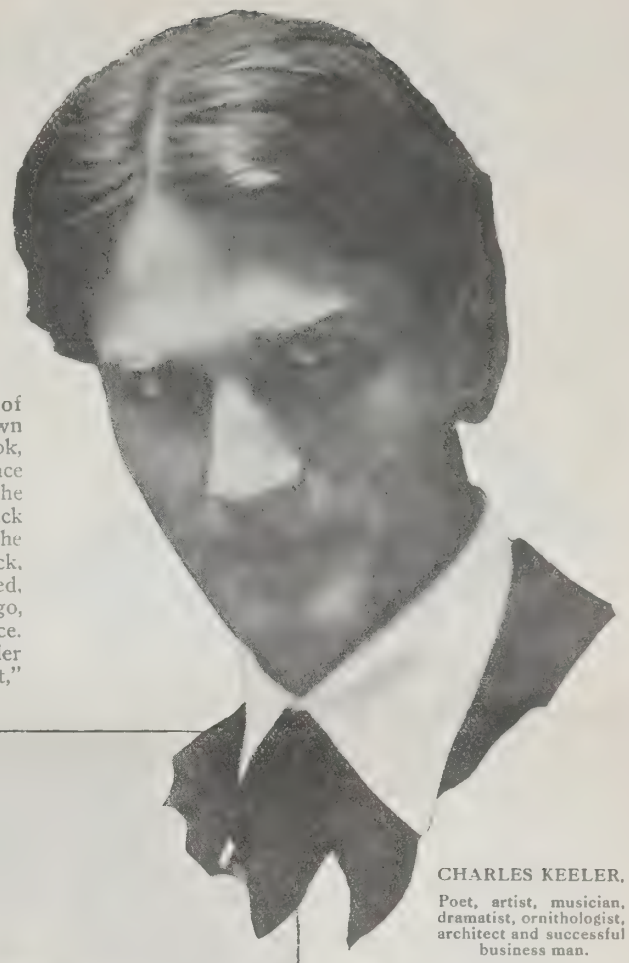
IN CONCLUSION, America has spoken for Prohibition in unmistakable language. The man or woman or agency which condones its violation, or becomes a party to its violations, or encourages a sentiment of laxity in regard to its enforcement, is helping to create, consciously or unconsciously, a very serious condition. To "wink at" the breaking of one law and preach the observance of another is un-American.

I am a newspaper man by profession. I have full knowledge of the power of the press. I believe no agency has more power in the welding of public sentiment and few as much power. I appeal especially to the editorial and news writer, to the cartoonist, to the reporter, to the scenario writer, to the playwright, to lend every aid to law enforcement. The editorial, the cartoon, the news story, the film or the legitimate play, which has in it the direct statement or the inferential suggestion, that the dry program is easily violated, or should be violated, that it is a joke—is not only harmful in the warping of sentiment against the enforcement of this one law, but obviously such influence leads to a disregard of law in general.

I wish that we might have in America a revival of regard for the sanctity and majesty of the law. I wish that it might be preached by the parents in the home as well as by the teacher of the school; by the preacher in the pulpit; the writer and cartoonist, through the press; the actor on the stage, by every good citizen and agency. With comparatively few officials to enforce the Eighteenth Amendment, the work cannot be effectively done without the co-operation of a helpful citizenship.

Building a House With Poetry

Every Verse Helped to Pay for Home



By HARRY H. DUNN

THE general idea seems to be, in this day of specialized industry, that poetry is, to say the least, financially unremunerative. Even those of us who make a typewriter pay the rent and eke the board bill, too, have the conviction that he who essays the art of verse-making must have a wealthy aunt or a willing uncle, or some other anchor to windward. Yet, out in the beautiful Berkeley Hills, back of San Francisco Bay, one of the show places of that land of fine homes is the "house that poetry built." Every stone in the house represents a verse, every pail of cement, a line worked out with rhythm, though not always with rhyme, by the owner, the man who, as he wrote the verse that paid for the house, worked also with his hands to erect it.

The man is Charles Keeler, who has attained success as an amateur dramatist, since one of his plays has been produced by the world-famous Bohemian Club, of San Francisco: as a writer of song-plays, since his productions have been presented by readers and singers east or west from the Golden Gate all round the world; as a lecturer, since he spent two years of his youth on tour of the world—and went all around it, too—on the returns from lectures and recitals given during that tour; as an ornithologist, since he filled that official position on the celebrated Harriman expedition to Alaska; as a forester, since he was the close friend of John Muir, and, finally, as a business man, since he is now, and has been for some time, the director of the destinies of the University City's commercial organization, which has just given into his control some $50,000 a year, to be used in the development and expansion of Berkeley.

The foundation stone of all this advancement was an ability and a desire to write verse, and an unswerving determination to tell the world, just what he believed to be right, through every medium of expression at his command. The idea of most of his verse came to Mr. Keeler when, as a boy, he wandered through the great mountains and the towering forests of the West in search of health. He began to apply the inspiration he so obtained to the affairs of men and women in everyday life, in spiritual relationships, and in the finer sentimentalities of being. He soon found a considerable reading public, and his books are still being published.

Like many other poets, he soon found that verse is the key to many a childish heart, and his "Elfin Songs of Sunland," are to California children a classic. Some of his dance-poems, notably "The Harper's Song of Iris," and "Princess Papilio," a butterfly dance, have been presented in New York by soloist dancers on many occasions. Of his poetical plays, probably "The Bird's Christmas," and "The Song of the Gong," are the best known, though "The Triumph of Light" also has been widely approved. Among his prose works, "Bird Notes Afield" is considered a standard for bird students in California. But, back to the building of the House. The land which bears it lies overgrown with a lordly oak forest, centered by a singing brook, backed by a higher ridge of hills, and itself at once the shoulder and the canyon between two of the typically rounded hills which lie a short distance back from the sea all down the California coast. On the crest of this lower shoulder stood a mass of rock, which, though ground away and somewhat flattened, had resisted the movements of the great glacier ages ago, and all the erosive power of wind and water ever since. On this huge knob as a corner stone, Mr. Keeler laid the foundations of the "house that poetry built," a veritable "house builded upon a rock."

CHARLES KEELER,
Poet, artist, musician, dramatist, ornithologist, architect and successful business man.

A corner of the "house that poetry built" with a glimpse of the builder's Little Outdoor Theater, in the foreground.

An audience in Mr. Keeler's Little Outdoor Theater enjoying a play written by Mr. Keeler and staged by him.

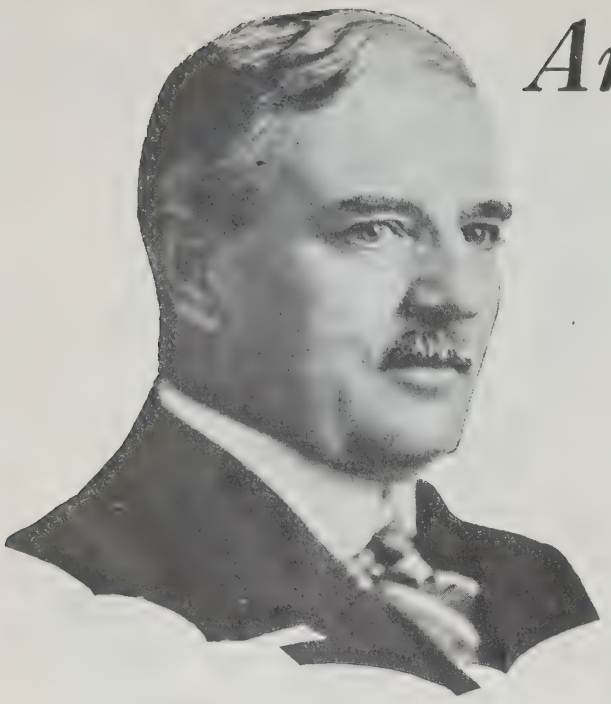
With his own hands, a little aid and direction from workmen and builders, the poet-dramatist built this home, which he had designed himself, after the style of the half-Spanish, half-Moorish residences of old Mexico. It is at once a home and a monument to the genius of the builder, for it is like a castle, built of stone, welded to the stone which forms its base, and sheltered on all sides by handsome groves of oaks. To give his neighbors and friends entertainment and educational enrichment, Mr. Keeler built, also with his own handiwork, and his own actual labor as well, a Little Outdoor Theater, in a semicircular dell just in front of and below his home. There were given plays and recitals, free to all who cared to come, with the massed foliage of several oaks for the back-drop on the stage, the level green of the brookside for the stage itself, and the California sun in charge of the lighting effects. And the while he was doing these things, he was introducing, unthinkingly, perhaps, but surely, nevertheless, the open-air sleeping porch to the architects of Northern California, whence it spread, first to Southern California, and thence all over the world.

So his mind ranged from the ephemeral vales of poesy to the hard plains of architecture, and left its mark on both. Practically, too, he cared for and brought to young womanhood and manhood two daughters and a son, one of whom is now a promising wielder of the brush on canvas, one a dancer of ability, and the third, the boy, an ornithologist.

Reading the Ancient Alphabet of Montezuma

Concluded from page 2

that for the district of Micmaloyan, which shows a human hand in the act of grasping a fish. This is easily divided into *michin*, meaning "fish," and *malli*, meaning "captured," or "caught." The termination *yan*, like *than*, means "place," or "place where"; consequently, we have this apparently formidable word meaning merely, "a place in which fish are caught."



The symbol for Molotla, a village which still exists, by the way, was a crude drawing of the red-headed burion, or house finch, with the head painted a brilliant red. The Nahua name for this bird was *molototl*, which was abbreviated to *molotl*; hence, Molotlan, or Molotla, "place in which there are red-headed finches." It will be noted in the results of all this work, of which I can give but the most brief outline here, that wherever there was any abundance of wild life of any kind, from snakes to humming birds, that was taken advantage of in the selection of a name for the place. Probably this was done for two reasons: First, to direct the people to a place where food was obtainable, and, second, to identify each place by some feature which would be considered of enough importance to be remembered by the majority of those who heard it. A few tribal names exist, such as Tula, supposed to have been the home of the Toltecs; Acolhuan, the home of the Acolhuas; Aztlan, the original home of the Aztecs, and some others, but the majority of the names are those of location, as regards rivers and mountains; food supply, as the "bean-town" of Etlan; and of animals, birds, and even insects. In the last-named class, perhaps the most interesting is Chapultepec, a hill on the outskirts of the present Mexico City, on which is now located the summer home of the presidents of Mexico, in Chapultepec Palace. This, in the original Nahuatl, was *Chapol-tepec—chapol*, "grasshopper," and *tepec*, "hill"; or Hill-of-the-Grasshopper.

The snake was looked upon with reverence by all the Indian tribes of what is now Mexico, Central America and South America; was worshipped by at least two of them—the Maya and the Nahua—and gives rise to some interesting ideographs. One of these is the symbol—possibly "coat of arms" would be the better name—for a village which still exists. It represents the common sign, *tepec*, for a hill, out of which projects the head and part of the body of a large serpent, the Nahua word for snake or serpent, irrespective of variety, being *coatl*. This symbol has been translated as meaning "the place, or the hill, where there are snakes," but if the Indian picture-maker had intended this meaning, he would have shown a number of snakes, rather than one. The fact that only one snake appears, and that it is shown at the top of the hill, indicates, to my mind, and in the opinion of others interested in this work, that this was a place in which the serpent-god was worshiped, a translation borne out by the finding, on an artificial hill or pyramid, near Coatepec, of a temple with carvings of the feathered serpent.

This feathered serpent, by the way, greatly resembles the well-known Chinese dragon, and from this resemblance, the idea has arisen that the worship of the snake came into what is now Mexico from Chinese wanderers, blown across the Pacific by contrary winds. From the word *Quetzalcoatl*, the well-established name of one of the Nahua divinities, however, we are beginning to believe that the worship of the serpent was of local origin among the Nahuas, or, possibly, among the Mayas, and from the latter transferred to the Nahuas, when the two empires came into contact in what is now Southern Mexico. The word *quetzal* was and is the native name of a bird of the parrot family of very beautiful plumage. From the skins of this bird, the royal robes of the Maya and Aztec rulers were made, and the killing of the bird, or the wearing of its plumage by any other than royalty, was punishable by death. The Nahua word for snake, as I have said, was *coatl*, and the combination of the two form the name of the deity—*Quetzalcoatl*. The opinion is becoming general that both word and winged serpent were the invention of some prehistoric priest, seeking to strengthen his control of the people by presenting them with a new god, at a time when the military caste was endeavoring to wrest from the priesthood the balance of power in the Nahua Empire. That this contest took place, about 1300 A. D., in what is now the Valley of Mexico, is an established fact, and out of it came the supremacy of the Aztecs in the Nahuatlac Empire.

The most interesting, and the largest, representation of the winged snake is on the retaining wall surrounding the truncated pyramid on which stands the ruin of Xochicalco—the "house of the yellow flower"—about 70 miles south of Mexico City. This picture of the winged serpent is done in bas-relief on stone, the carving being from six to eight inches deep, and entirely surrounding the ruin, which is some 90 feet in length by 60 in width, a distance of 300 feet. This ruin, in common with all other important Nahua and Maya remains in Mexico, is being preserved in a government reservation.

As rapidly as possible, the ruined temples and cities are being restored, the mural decorations repaired with cement and repainted, the bas-reliefs lifted to their places and set back into concrete beds, and the grounds around the ruins cleaned off, so that each ruin may become, in time, a museum of its own district.

DR. HENRY JACKSON WATERS

An Apostle of Better Agriculture

What Science Must Do for the Farmer

WE PROBABLY are at the end of our greatest expansion in the influence of invention on agricultural production. Future progress must be in the direction of refining agricultural processes, eliminating waste and warding off uncertainties. The farmer is too dependent on the turn of the weather, the presence or absence of insects, to call his business a settled or stable industry. It is along these lines progress must be made. It is by that progress the millions of the future must be fed.

Inventions have given us machines that add greatly to the power of man. But in no instance have they added to the power of the soil. It is the soil, in the long run, that is the limiting factor. The contribution of science has been in the direction of saving the soil, of protecting crops and animals against destruction by flood and drought and insect and disease. It has been in the direction of making the harvest more certain. There are a thousand ways in which science may help agriculture.—Dr. Henry Jackson Waters.

By E. B. CHAPMAN

IN THE early '80's a young assistant in the College of Agriculture, University of Missouri, was discouraged. A shake-up in the school had eliminated from the faculty men who had been his superiors, associates and advisers. The assistant had been given charge of the experimental work, formerly directed by three men. Their salaries had totaled $7,500 a year. His pay had remained $50 a month.

An offer of a $1,200 a year position in the Department of Agriculture at Washington had been received and the young Missourian was about to accept it.

One of the displaced professors visited the young assistant at his work. The professor had learned of the Washington offer. The conversation skillfully was guided to that subject. The younger man said he believed he was underpaid and asked the older man's opinion.

"From what I see I believe you are paid about what you are worth," the former instructor said. "I don't believe, if I were you, with your youth, inexperience and opportunity I would think I was underpaid.

"Instead, I think you are fortunate. Placed in charge of work three men formerly directed, you have an opportunity for education and service that seldom comes. There is no limit to the possibilities. It would be a mistake to leave if you were receiving no pay."

"And right there," Dr. Henry J. Waters, known throughout the nation as an authority on agriculture and now editor of the weekly Kansas City *Star,* says, "I quit thinking about salary. I realized that service and opportunity to add to my knowledge were the indispensable things. They would govern salary."

Of course, the Washington offer was refused, the young assistant continued in his work and one of its most widely known figures was saved to agriculture.

The unusual seems to have been almost commonplace in the earlier life of Dr. Waters. The son of a farmer, he studied Latin and Greek under his father. The first year in college he took a liberal arts course. There was no inclination on his part to the scientific study of agriculture. One day a letter from his father inquired if the student had read a newly published work on stock breeding. It was suggested he talk to the dean about it. In the letter the father observed that he believed there was a greater opportunity for the educated man in agriculture than along any other line. It was urged that the student talk to the dean about that, too.

Study of Agriculture Not Popular Then

MEETING the dean one day, young Waters asked him about the book and the probable future of one scientifically trained in agriculture.

The last clause interested the professor most. He went into the matter thoroughly. Five times the student inquired how many were taking the wonderful course and each time the educator ignored the question. When the student transferred to the agricultural course he found there had been none. He was the only student. He went through the course, the only student. In the lecture rooms day after day there were only two present, the instructor and young Waters.

Agriculture was in a slump in western institutions at that time. Interest that had prevailed before had failed. From that year, however, interest revived and now the study of agriculture in the Middle West is on a far different basis.

But the young student was made of stern stuff. He stuck it out. More than that, he caught coons and sold the skins for 50 to 75 cents each to help pay his expenses through school. He dug ginseng roots and sold them. He cut corn, receiving the low wages of the times and saved the money to help defray college expenses. In school he addressed envelopes and did such other work as was available. All the time his father was willing and able to advance the money needed. He did advance some of it, but the student wished to be self-supporting.

After graduation, young Waters had a place with the Missouri Board of Agriculture. It gave him a thorough knowledge of his state such as comes to few men. Then he became an assistant in the Missouri experiment station, where came the turning point in his life discussed earlier. Two years later came a place as the professor of agriculture at the Pennsylvania State College. He was the first man to be called from the West to teach agriculture in the East.

"I found myself outclassed," he says. "I was among scientists trained in Germany, with their degrees—and whiskers—from there. I made up my mind there was only one way for me to make good. That was to go to work at 7 o'clock in the morning and work until midnight. And I was determined to make good."

The seven-till-midnight program was put into effect.

When Professor Waters took charge, the class in agriculture consisted of three students. Two of them quit the course because of illness. But the professor knew there were thousands of boys on Pennsylvania farms who needed the training the state was providing. He went out into the brush after students and came back to the college with them. After four years, when he left the college, 100 students were studying agriculture.

Still a youngster, as professors went at that time, he returned to the University of Missouri to become dean of the College of Agriculture—from which he had been the only graduate six years before. And in the 13 years he filled that office the college grew from almost nothing to the second largest college in the university.

He Added to the World's Knowledge

MUCH of the world's knowledge of cattle and hog feeding is based on experiments conducted by Dr. Waters while he was dean of the college and given to the world in bulletins, books and through the press, for the seven-till-midnight schedule begun at the Pennsylvania college still asserted itself. He went into every county of the state telling people about their college and fighting enemies of the institution, who had grown numerous.

Dr. Waters gathered the splendid agricultural exhibit of the state of Missouri at the St. Louis World's Fair. He spent two years studying in Germany and another in Switzerland.

The last few years of Dr. Waters' activities have been still more varied. As president of the Kansas State Agricultural College, he reorganized it and made it one of the leaders of such institutions. When he went to Manhattan, only 25 schools in the state were teaching agriculture. When he left no pupil could go through the grades in Kansas public schools and not study that subject. His textbook was used in every high school in the state, the royalties that accrued to him going to a fund to help deserving students attend college.

While he was at Manhattan occurred what he terms "the greatest thing that ever came my way." He was named a special commissioner of the President to study the educational and agricultural systems of the Philippines and suggest improvements. He spent a year's leave of absence in the Orient. Returning, his report formed the basis for changes that have been of untold benefit to the islands.

His experiences and observations that year may be one reason why Dr. Waters is not one of the back-to-the-farm enthusiasts.

"I saw in China the utter lack of progress a non-industrial system entails," he said. "There were the deplorable results of an exclusively agricultural system 4,000 years old. Without an industrial system there is no stimulus and no outlet.

"China and India are the only two exclusively agricultural system nations. They are the only ones that have famines regularly."

In 1917 Dr. Waters left the Kansas college to become editor of the *Weekly Star.* He regarded it merely as an opportunity to increase the size of his classroom. Instead of lecturing to only a few hundred students, at most, he speaks, through his signed editorials and the other columns of his paper, to almost 400,000 families each week.

He has no faith in political remedies for fundamentally economic ills and doesn't hesitate to tell farmers so.

"The farmer has been led by politicians to look to Congress for too much," he says. "Congress can't cure all the farmer's ills. The farmer must do most of it. He must become self-reliant. He must save himself if he is to be saved."

"We have all the people on the farms we need," he continued. "There are as many there now as can make a living. What we need is a better industrial system so the surplus can live better in town and buy more of the farmer's products."

That brought up another subject Dr. Waters likes to discuss. That was moving to the country for advantages.

"The average boy needs to learn to work," this editor says. "He can't learn to work in town. There is nothing he can do. Even the rural town isn't free from that curse. On the farm he learns to work."

In the next breath he answers those who would keep the boys on the farm.

"The boys must have the greatest possible freedom in choosing an occupation," he says. "They will stay on the farm, or go back to it, if they can do better there than in town. If they can't, it will be impossible to keep them there.

"Justinian, the ancient law giver, had tried to compel people to stay on the farm and Augustus had tried to persuade them to stay there. Both failed. Farm life must be made profitable and comfortable."

Perhaps the one person on the farm who gets most of Dr. Waters' sympathy is the average farm wife. She is the only person in the world who puts in longer hours than the farmer, Dr. Waters said.

"An electric light system that could be used every day in the year would relieve Monday of its washboard terrors," he said. "It would cost little more than the binder, used one week of the 52. A complete water system, electric lights, vacuum cleaner, power washer, power separator and power churn would cost little more than the tractor, used less than 30 days a year on the average farm."

Efforts to obtain improved marketing systems to which thousands of farmers are looking to give them a larger share of the consumer's dollar attract the sympathy of this agriculturist, who thinks in world terms on that subject. He hopes they will succeed. The farmer must have more money. But Dr. Waters isn't telling the farmers they are sure to succeed, nor altogether blameless for present conditions. He points out that the farmer, now demanding a reasonable profit on his product, may be required by the public to use modern methods in production.

"The farmer, while forced to economize, is a great waster," Dr. Waters says. "For more than half a century he has been urged by press and platform speakers to produce better live stock by the simple expedient of using better sires. Yet few have learned the lesson. And money is lost to millions of farmers each year because they have failed to heed the appeal."

As long ago as 1916 he began telling farmers to prepare for the slump that was sure to come. He pointed out the record of other wars. He urged some of the profits be held for the slack times that were to follow. He doesn't refer to it now. He isn't an "I told you so." Instead, he is working along with others interested in the subject, trying to find the way to relieve the situation.

Shipping cattle and hogs to market and going to the butcher shop for meat, as it has come to be practiced in many rural communities, arouses Dr. Waters' ire as an inexcusable waste. He tells his big class how to cure its meat, vary its diet and build strong, well-developed children. The Waters cure for ham is used all over the Mississippi Valley.

Calls Farm the Best Place

"ALERT" is an expression that seems especially useful in describing Dr. Waters. The term "snappy" possibly fits well his conversation. His decisions are made quickly. When they are shown to be incorrect he is quick to acknowledge the error.

In the middle 50's, he looks 40. He is about six feet and weighs about 200 pounds. Married in 1897, he has one son, H. J. Waters, Jr., a student at the University of Missouri. Two of the things in which he takes pride are interesting: One is the fact that when the National Economic League was organized he and his two brothers, one a minister in a rural community, and the other a farmer and merchant, were nominated for membership. The other is that, when a boy at home in Ralls County, he was known far and wide as excelling in breaking mules to work.

"Notwithstanding the low return it brings," Dr. Waters says, "the farm is the best place today to accumulate property. It is the straightest and broadest of all highways to a competency.

"The working man in the city dies without estate. If we had only the city wage earner there would be no need for probate courts. There would be nothing to administer.

"The hired man on the farm is the lowest paid wage earner in the nation. That applies alike to America, China, anywhere that agriculture is practiced. Still the farm is the best place and the farm hand has the greatest chance to become independent of any wage earner.

"A part of his wages saved a few years and he can buy a team, wagon, harness and farming implements. Then he can rent a farm a few years, marry and by the time the babies begin to arrive, make a payment on a piece of land.

"Before the children are ready for high school he can have the farm paid for.

"I know of no other young man who has as good a chance to become independent as the farm hand."

Divorcing My Lady Nicotine After Ten Years

One Man's Sufferings in His Battle Against the Tobacco Habit

By D. M. LE BOURDAIS

I DO not think I could have been much more than 10 years old when I smoked my first cigaret. A drunken man gave us—my younger brother, another youngster and myself—a package of cigarets and some matches. We went down into the bush below town and sat in a secluded spot on the bank of a creek. The cigarets we divided evenly among the three of us; the odd one—there were ten in the package—being claimed by each, was finally left to be the property of him who first finished his original three.

For a few moments the blissful rapture of a new experience was unalloyed. We held our cigarets between two fingers in an attitude of the greatest nonchalance, conversing meanwhile in the exaggerated tones of boys playing at being men; but it was only for a moment...! Soon the day's bright promise became overclouded; the world seemed strangely off its base; the outline of the trees grew dim; they seemed to be moving in a vague procession; the horizon began to undulate in snaky curves going faster and faster until our heads grew giddy with its speed; even good old solid mother earth was no longer to be depended on; she seemed to be coming toward us in a succession of bounding billows. Each of us went his way a little distance apart and there flopped down in almost eager anticipation of that death which seemed not far removed and which appeared then to be strangely welcome if only it come soon.

Their Dreams Rudely Shattered

AFTER deathly nausea and convulsive retching followed by an unmeasured period of merciful oblivion, three small boys, their faces drawn and white, stole quietly home in the gathering dusk. On the grass, neglected, lay three partly-smoked, and seven untouched, cigarets; nearby was a little bundle of matches. The problem of the odd cigaret was no longer a burning question. Three little boys made no definite resolutions, but they were in practical unanimity regarding the hollowness of the claims of tobacco as a dispenser of pleasure.

It is just as well that definite resolutions were not made, because they should only have been broken later. I do not remember how or when I essayed my next smoke, but I must have met with more success. I have a dim recollection of being sick on other occasions, but nothing so desperate as that first time. Like Mark Twain, I smoked with discretion during those first years, but when I was 15, I smoked openly and had begun collecting pipes. When I was 16, I got a job in the office of the Yukon Telegraph Service at Ashcroft, keeping the books. I was there only three months, relieving the regular man who was away on his vacation. I received $75 a month, which was a good salary as salaries went in those days. I thought quite a lot of myself.

I spent the next three years in charge of a telegraph station at a place on the Cariboo road called Lac la Hache, where I had nothing to do when the weather was fine but copy an occasional telegram and sit around and read—and smoke. I was responsible for the maintenance of 60 miles of telegraph line. After every storm, and frequently in the intervals, I would have to climb on the back of my cayuse and ride out to chop away whatever timber had fallen across the wires and make the necessary repairs. It was on these trips that I learned to chew tobacco.

He Takes Up Chewing, Too

THE next two years were spent at a place called Barkerville, in the placer-mining district of Northern British Columbia, as postmaster, telegraph operator and a number of other positions rolled into one. Here I read and smoked more than ever—pipe, cigar, cigaret, one after the other without cessation all day and a great part of the night.

Tiring of inside employment, and longing for a chance to become identified with the life of activity to be seen around me on all sides, I bought a portable sawmill outfit, procured a number of lumber contracts from the mines roundabout and went into the woods with a gang. While working in the woods I did not have time to smoke quite so much as I had been doing, but I became more addicted to the use of "eating" tobacco.

It was about this time that I first began to think of quitting my lady nicotine. In August I had finished the last of my contracts, a number of the mines had closed down and the prospects in the lumber business were not particularly bright. I laid the crew off and sent the whole outfit into town, remaining alone in camp to tally up the remaining lumber and to make everything shipshape during what might prove to be a lengthy lay-off. I expected it would take me about three days to do what was necessary.

The outfit had scarcely gone before I realized that I was completely out of tobacco. I went through the cookhouse and the bunkhouse and rummaged among the things in my tent; but nowhere was there a scrap of tobacco of any kind. I dug up all my pipes and smoked the dregs of previous enjoyments; but that was only temporary palliation. Finally, I resigned myself to my three days' enforced abstention, trying to concentrate on the work in hand; but every few moments I would catch myself unconsciously feeling through my pockets for something that was not to be had. By evening I had worked myself into a state of irritation which would not admit of reading or anything else.

The next morning I did not attempt to do any work; after breakfast I set out on foot for town, about six miles away. I did not get back until late in the afternoon; and I thus lost nearly a whole day just because of the lack of tobacco. This set me thinking. I did not like to admit that anything could get such a hold on me that it could practically dictate to me; but at last I had to face the fact that tobacco was my master.

I don't think I would have minded so much going without it for a few days if I had known that I could have a smoke at any time should I so desire, but to know that I could not smoke at all—that was hell. Nevertheless, I made a resolution—about as useless as are most of its kind—that some day I would give up smoking—but not just yet!

A few months later the country was in the throes of a land boom and I was out staking and cruising land. If one would quit smoking, I would never advise trying the experiment while out in the woods. If there is one time more than another that the inveterate smoker gets real pleasure out of his pipe it is then.

When, after a hard day's work, tramping with a pack on his back or poling a canoe up a swift stream, he lies in front of the camp fire during the interval between supper and time to roll up in the blankets, while the talk wanders from one strange corner of the world to another, as it will when such men get together as are more often found by camp fires than by the cozy hearths of a home—then, unless he shall have been fortified by months, and even years, of abstinence, he will long for his pipe.

That summer I made $30,000—on paper. It was not until the latter part of October, however, that I came to the final and painful conclusion that I not only had been beaten out of my summer's work, but that I was again stony broke and under the painful necessity of getting a job without the least possible delay.

The Weed Undermining Health

ON NOVEMBER 1, I began working as night operator in the Canadian Pacific Railway's commercial telegraph office in New Westminster—just half an hour's ride by trolley from Vancouver. I hoped to get a "road stake," intending to go into the Peace River country in the spring. I had to work from 6 p. m. until whenever I got the wires cleared—generally about 2 or 3 o'clock in the morning. I wouldn't get up next day until nearly noon, but during all the time I was awake I'd be smoking cigaret, pipe and cigar, one after the other interminably.

From time to time my old resolution, some time to quit for good and all, came to me, but the thought of sitting before the camp fire the next summer listening to the yarns while the others smoked—and not smoking myself—was too much. for my imagination. It simply could not be done! Yet I found the continual heavy smoking beginning to affect my health. I nearly always had a cough. In the mornings my mouth felt like a limekiln. My eyes had never become accustomed to much smoke and were often sore.

It was New Year's Eve and I was copying messages. I had spent most of the day alone—smoking. I had had dinner at a Chinese restaurant and the greasy fare irritated me. Now the whole world and his wife were sending idiotic telegrams to everybody else wishing a "Happy New Year"; it made me more and more grouchy the longer I copied. As the evening wore on I became conscious of a dull pain in one ear—the one nearest the resonator; presently the pain became more acute and I had to switch the resonator to the other ear. By midnight the pain had become intolerable and I had to telephone the manager to come down and relieve me.

I hunted up a doctor who told me that I probably had an abscess in the inner ear; he gave me something to relieve the pain and said he would see what was to be done in the morning. I went to bed and tossed for several hours before falling asleep. When I awoke the abscess had broken. On examination the doctor discovered that the ear drum was ruptured. He put his watch right into my ear but I could hear nothing. I was totally deaf in that ear. He said the hearing might return, but he appeared to be doubtful. He examined me thoroughly and declared that I smoked too much. He said I had a chronic sore throat from smoking; that the irritation set up in the throat had been communicated to the ear by the eustachian tube; that as long as I continued to smoke I should be in danger of repeated attacks and that I might not always get off so easily as I had in the present instance.

As a result of my talk with the doctor, I resolved to stop smoking there and then, but I left myself one loophole: I would not carry pipe or tobacco, but I would in future just smoke for the sake of sociability. If I happened to be in company where everyone was smoking, I would take a cigaret or a cigar; but only to avoid being an exception to the general rule. As a smoker, I was through!

Fine resolution! It never was really effective after the first few days. After a couple of weeks the hearing gradually came back in my injured ear and nature repaired the ruptured ear drum. I had really cut down my smoking a great deal, but it was inevitable that I should soon find myself smoking again as hard as formerly. In a few weeks I had bought other pipes and tobacco pouches to replace those burned or given away in the first fervor of my early zeal as a convert from the worship of the nicotine goddess. It was not very long until I was smoking as much as ever. And then I got an abscess in the other ear!

I have always recognized as a fact that man is liable to error, but I likewise believe that only a hopeless ass makes the same mistake twice! I stopped smoking. This time there was no mental reservation of any kind. I was finished with the weed for all time.

He Finally Casts Her Off

I NEVER expect again to go through such a time as I did during the three months in which I fought the seductive allurements of my lady nicotine in all her attractive forms. There were times when the call of tobacco was almost overpowering. Endlessly, whenever my mind got interested in something, I searched my pockets for that which was not to be had. Impatiently, I would catch myself at it and try to break the rule of habit. Gradually the desire grew less; I began to notice an improvement in my throat; my mouth, for the first time in years, felt in the morning as if it were made of something else than flannel; my eyes felt better and my general health improved. When a year had rolled round without my having used tobacco in any form I felt that I was cured. I had no desire at all to smoke; I never thought of it. My months of hell had been worth while.

Now after ten years, I can truthfully say that nothing I have ever done has given me such satisfaction as breaking the tobacco habit; it is a blessed emancipation.

I always feel a bit sorry for young fellows—and young women, too—when I see them trying desperately to acquire a habit which later on will in all probability make them its abject slaves. There are some who can smoke in moderation; but my observation leads me to believe that they constitute a very small minority.

I am not one of those who consider smoking a moral question; but I do hold that the great prevalence of the use of tobacco constitutes a colossal economic waste, although not more so than many other of our customs. I am not in sympathy with much of the mooted prohibitory legislation that one hears more or less about in these days; but I should like to see the development of a healthy public opinion on this and kindred subjects.

In conclusion, I feel quite safe in saying that after an experience of ten years as a smoker and ten years as a non-smoker, there is not money enough in the world to tempt me to become again a slave to my lady nicotine, and I say this with a full appreciation of the value of a dollar.

Winter Adds New Pathos to Indian Appeal

Concluded from page 7

Besides obtaining emergency relief for the members of the tribe, Mr. Hamilton hopes to obtain provision for restocking the Indians with horses and cattle. He hopes also to work out a more helpful plan of agricultural assistance to the Indians on the part of the government. And then there is the big thing for which he has been fighting these many years—reparations for the lands which the Blackfeet say were taken from them unjustly. Several times bills have been before Congress referring these claims to the Court of Claims for adjudication, but never has one passed both Houses.

"The Blackfeet nation once was the most numerous, most powerful, most warlike people in the Northwest," Mr. Hamilton said. "It owned and occupied a vast territory, now comprising part of Montana, Idaho, the Dakotas and part of Canada. Out of this, a diminished territory was set aside by the treaty of 1855. But in 1874, the government, by act of Congress, took away approximately 26,000,000 acres of this territory. More and more the white men encroached as settlement of the country proceeded. In 1887, the government talked the Indians into another treaty, cutting the reservation down to a smaller territory.

"Tracts of land were taken away by executive order, and given back by executive order. Tracts were taken away and replaced with others. Some of the land was taken away under an unratified treaty. The result was that the Blackfeet Indians were left with a small reservation up on the very slopes of the Rocky Mountains, whereas much of the territory taken away from them contains low prairies and fertile valleys.

"Altogether about 30,000,000 acres of land, or approximately a third of the state of Montana, was taken unjustly or through false representations at various times."

Getting Congress to see the justice of this claim may be a hard job. Curley Bear, a stalwart old chief who appeared at an earlier session, said: "This is the third time I have been down here on this case, and each time I go home with a broken-down heart."

But the Blackfeet are going to keep up the fight, according to Mr. Hamilton.

Hunting News of Washington—and Finding It

A Reporter's Story of His Quest for New Stories of First President

By WILLIAM ATHERTON DU PUY

I HAVE gone out as a newspaper reporter to find stories heretofore unknown of the Father of His Country, the commander-in-chief during the Revolution, the first President, George Washington, of Mount Vernon. I have for 15 years in the twentieth century looked for news of a man who lived in the eighteenth. And, strangely, here and there, I have found it.

Not to tell the best story first and thus be forced to the humiliation of an anti-climax, let me relate the incident of a post which stands in the center of the intersection of two venerable highways.

I rode out over that first highway that was cut through the northern neck of Virginia when America was young and outposts were being established prophetic of a nation that was to be. This road runs from Alexandria to Winchester, Virginia. Standing there in the middle of it some eight or ten miles before one reaches Winchester is this post, painted white and bearing a lamp at its tip. There is something quaint and unusual about this post and its lamp, something unattuned to the sputter of the passing automobile. One takes note also of a low stone building on the corner near by—a quaint structure that seems to have come out of another age.

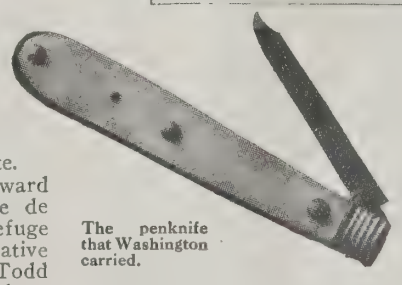
The picture of Washington which was approved by his intimate associates and who pronounced it his best likeness.

Investigation develops the remarkable fact that this post in the middle of the road far out in rural Virginia was planted by none other than George Washington, who came here into the wilderness at the age of 16 to survey a grant which had been given to Lord Fairfax by the king. The old stone building on the corner was erected by a retainer of this doughty English lord, who dubbed it the White Post Inn, from the landmark in the middle of the road, and who served refreshments to many of those men who helped in the formation of a nation.

The white post stands at a crossroads, and the bisecting thoroughfare was surveyed and laid down by young George Washington back in 1748. It connects Greenway Court, a measured mile away on a hill which the young surveyor picked out, with Harewood 20 miles in the other direction, the estate of Samuel Washington, the old house of which still stands as another relic of the skill of this young engineer, for he built it before his elder brother came here to live. Over on the hill at Greenway Court beside the mansion stands a little one-room stone structure, the cabin in which George Washington lived during those four years between the ages of 16 and 20, when he worked as surveyor in this wilderness and laid down the ground plan for this part of the state.

But young George Washington carried the news of the wonders of this country to his relatives in tidewater Virginia. As a result, Lawrence Washington, an older brother and a man of means, acquired large tracts here. Lawrence, however, died shortly afterward and the three other brothers in dividing his property came to see these lands, fell in love with the country and later came here to live, bringing their families with them and here dwelt to the end of their days.

So it came to pass that more of the blood of the Washingtons exists today in the veins of the residents of Charlestown, West Virginia, near by, and in the community surrounding it, than in any other part of the world and probably more than in all the rest of the world taken together. The stranger dropping into Charlestown is likely to be impressed with certain peculiarities of its inhabitants that seem familiar to him. There are to be seen on the streets numbers of men, tall, upstanding, stalwart, with a certain dignity of bearing that one seems to have seen before. He asks a passer-by the name of a certain man who has attracted his attention and is informed that this is Bushwick Washington. The same query brings further the reply that another straight and athletic-looking individual is Samuel Walter Washington. It dawns on him that these men have the qualities that he has always associated with the Father of His Country, that these are Washingtons of the old stock and that they retain its traits. Scores of men in Charlestown may be picked from the crowd by these peculiarities. Major General Peyton C. March, chief of staff during the war, six-feet-three, straight, athletic, precise, is a descendant.



An inquiry establishes the fact that the community is overrun with the descendants of the family of Washington. And why should it not be? The three brothers of General George Washington, who lived there, bred families, some of them wondrous large. Their descendants have lived here and diffused the blood until the whole countryside is possessed of it and affected by it. The nearest descendants of the Washingtons of the generation of Revolutionary days have their homes here today. When I was in Charlestown I called on Richard Blackburn Washington himself, a venerable patriarch of 87 years, who has since died, then the nearest living link to the olden days.

Harewood, just out of Charlestown, is, next to Mount Vernon, the estate of them all, about which hovers most of early American romance. It was in 1752, 170 years ago, that it was built. Samuel and George were partners. George had actual charge. He was the architect. The stone for the walls was hewn from the limestone beds on the estate and the men who hauled it got an acre of land per team a day, so cheap was real estate. The walls are two feet thick and so well built that the house stands today in a good condition of repair. The same ancient shutters hang at the windows that were made under the direction of George Washington. The coat of arms of the Washingtons, that from which the design and colors for the Stars and Stripes were taken, still holds place over the door. On the ancient walls still hangs the painting of Colonel Samuel Washington, the dashing, rollicking, fox-hunting squire, of the class who made early Virginia famous by their entertaining. The easy stairs and balustrades are almost identical with those of Mount Vernon and were furnished by the same English firm, crossing the ocean at Washington's order. The mantel over the fireplace was given to Washington by Lafayette.

Harewood, near Charlestown, for a century and a half the Mecca of the Washingtons.

The clock which stood on Washington's mantel when he died.

The penknife that Washington carried.

It was at Harewood that Louis Phillipe, afterward king of France, and his two brothers, the Duke de Montpensier and the Count de Beaujolais, took refuge during the period of their banishment from their native land. Here came from Philadelphia the Widow Todd to wed with Madison, who was to be twice President. The place is overrun with reminiscence. In the garden at Harewood there still exists the boxwood hedges and wealth of lilac that are said to have been planted by Martha Washington. There still remain a great number of flowers of wide varieties that found their way there from a similar source, for the first President and his wife were great horticulturists and fanciers of things that grow from the earth.

These have been lesser events in reporting George Washington 120 years after his death. I have read his intimate correspondence with Thomas Jefferson. I have found rare old records which tell of his first meeting with the Widow Custis at the home of a friend down on the Pamunky River. Colonel Washington was that day bearing messages from the forces fighting the French and Indians to the capital at Williamsport, but so impressed was he with the charms of the lady that he spent the night in the festivities of a gay house party and rode on in the early morning entirely without sleep.

But among the more important discoveries I have made is one which, I am quite sure, is the truest likeness ever put on canvas of the man who led the Continental armies for those 12 years and presided over the destinies of the nation in the formative span that followed. This picture bears but a faint resemblance of the Stuart painting, most often reproduced as the true Washington, and is quite unlike all the rest.

This painting, probably the true Washington, hangs in the old Masonic Temple at Alexandria, Virginia. Located in a venerable room over the market place, a room almost untouched by the passing of time since George Washington here presided as the Master Mason back in 1792. He was then the President of the United States, living at Mount Vernon, a few miles further on, with the city of Washington then unborn, and Alexandria the commercial queen of the South and the center of the President's social intercourse with his fellows. Those intimate and lifelong associates, bound to him in this Masonic lodge, carefully selected an artist to paint a picture of their brother Mason. His name was Williams and he lived in Philadelphia. He was duly commissioned and labored two years on this portrait, a flesh-colored pastel, and delivered it to this Masonic lodge. It was received by the first President's intimates with much satisfaction and was declared by them to be an excellent likeness of the man they knew so well. It is undoubtedly very much like the post-revolutionary Washington, the Washington who was President of the United States. It shows, for instance, that the Father of His Country had a mole under his right ear; it shows that across his left cheek there was a scar; it shows that his face was deeply marked by a severe attack of smallpox, which he is known to have suffered as a young man; it shows that beneath his chin the glands are enlarged, for the first President suffered from a goiter; it shows the massive and rugged outline of his countenance and gives it, I hold, a strength not indicated by his more idealized portraits.

This old Masonic lodge room is filled with relics of Washington. There is the chair in which he sat, the apron which he wore, the huge candlesticks of the Masonic ceremony, the clock which stood on his mantel at Mount Vernon when he died, and of which good Dr. Dick clipped the weight strings at the moment of his passing, and the hands of which still point to that melancholy 20 minutes past 10.

The best story of Washington that has come down by word of mouth through a century and a quarter and which is told only by the venerable Masons of this chapter, is that of the penknife which the Father of His Country carried in his pocket for 56 years, a penknife which may have changed the destiny of these United States of America. When George Washington was a boy of 11, this story goes, his father died and he came to Mount Vernon and there lived with his half brother, Lawrence. He received an appointment as midshipman in the British navy and was heartbroken when his mother later forbade him to accept it. Noting his despondency, his mother sought to cheer him with a present, a penknife dear to the heart of any boy, a much rarer acquisition in those days than now. When his mother gave him this knife she preached him a bit of a sermon on discipline which terminated in this admonition: "Always obey your superiors."

Through the decades that passed George Washington often showed this penknife to his associates, told them of the circumstances under which it was given him and that admonition of his mother: "Always obey

your superiors." Eventually came the greatest crisis in the life of this Father of His Country, a crisis which had its setting in that tragic winter at Valley Forge. With his half-starved, half-clothed remnant of an army about him, the commander-in-chief unsuccessfully demanded of the Continental Congress the support which he needed to carry on the war.

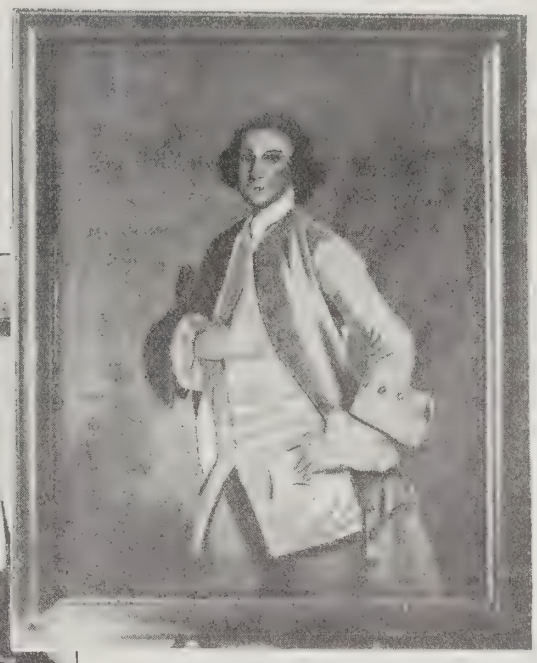
Finally, General Washington, as a last culminating protest, determined to resign his post. He wrote his resignation. General Knox, an intimate of his staff, asked Washington if he had in his pocket that penknife he had carried so long. The Father of His Country drew it forth.

"What," said General Knox, "was the admonition your mother gave in presenting the knife?"

The commander-in-chief went over the well-known phrase: "Always obey your superiors."

General Knox urged its application to the present situation, that the general had been ordered by a higher authority to command this army and that his mother would have had him obey. This argument resulted in Washington's withdrawing his resignation.

Finally, as a reporter hunting news of George Washington more than a century after he died, I ran upon a remarkable span between the eighteenth century and the twentieth century, having to do with this most revered man in American history. I found a man still living in the twentieth century who had gazed on the physical face of George Washington, who died back in the eighteenth century, and who still remembered the appearance of that face. The remarkable fact with relation to this strange story is that, although he had seen the face of Washington who had then been dead 112 years, John Lane was only 87 years of age. Here is the way it all came about: When George Washington died in 1799, his will asked that a new brick vault be built at the foot of the "vineyard enclosure" and that his body be entombed there. Some 30 years later Congress ordered a new vault built. In 1837 the new tomb was ready and a committee of Congress was appointed to journey to Mount Vernon and there supervise the transfer of the body.



Now, when this day arrived, John Lane told me, he was a boy of 12 and was a page in the United States Senate. Those were the days of the rising greatness of Henry Clay, who then occupied a seat in the Upper House of Congress, and Johnny Lane was by way of being a protégé of this distinguished son of Kentucky.

When the committee, of which Henry Clay was a member, was about to leave the Capitol in stagecoaches, the little page stood by and looked wistfully upon their going. Henry Clay picked him up and swung him to the seat beside the driver and thus he became a part of the cavalcade.

In this way it happened that when the tomb of Washington was opened, the youngest person present by nearly two score years was Johnny Lane. When the tomb was opened, a very strange fact was revealed. The tomb of the Father of His Country had shortly before been entered by ghouls. These ghouls had performed a most unthinkable act of destruction. They had chopped into the casket which contained the remains of Washington, had made a hole in it immediately over the dead man's face. At the time of the death of Washington the method generally pursued in preserving bodies was that of embalming them in alcohol contained in leaden caskets. It was thus that the body of the first President at the time of his death was treated. Immersed in alcohol and hermetically sealed in a leaden casket, it had been laid away.

Through the aperture which had been torn in the casket, the face of Washington could be plainly seen. It was still immersed in its preservative fluid. Henry Clay lifted his youthful protégé up that he, too, might gaze on the face of Washington. Long the lad looked, and deep were the impressions. The strongest impression, the strongest memory that John Lane brought away from this occasion, he told me 75 years later, was that of the huge bulk of Washington. The head and face seemed herculean. The face, he said, did not greatly resemble those idealized paintings which omitted the deep scars on his chin, the pockmarks on his nose. The features were bigger and more rugged than one would think from his pictures.

Decades later, when he had grown to manhood, John Lane visited the old Masonic Temple at Alexandria and there saw the Williams painting. It was the verdict of this man, the only individual in this generation, or this century, who ever saw the face of Washington, that the Alexandria painting is the true likeness of the Father of His Country.

Colonel Samuel Washington, from a painting which hangs at Harewood.

Relics of Washington, the Mason, to be seen in the old lodge room in Alexandria.

The chair in which Washington sat when he presided over the Masonic Lodge in Alexandria.

Things in the Making

GLASS

HOW can materials which in themselves are dense, be formed into a product which is transparent? This would seem to be impossible, yet in glass we have the answer. Seeing is believing, and as you look through your windowpane it would seem as if a miracle had been performed.

Glass is a transparent, hard, brittle substance, which is formed by the fusion of flint or sand with an alkali. Soda is generally used for this purpose, although for the finer sorts of glass, potash is sometimes used.

There are several kinds of glass: flint glass, or crystal; crown glass, broad sheet glass, bottle, or green glass, and plate glass. The different qualities of the glass are dependent on the proportion and degree of purity of the ingredients, and also on various accessory materials, such as niter, oxide of lead, manganese or arsenic.

For all kinds of glass, except flint, the materials after being purified are put into a furnace called a "calcar," where they are "calcined." This process is called "fritting," and the substance comes out soft and pasty, and is cut into squares which harden and are piled away for future use. In the final melting, the frit is put into crucibles, 12 of which are often in each furnace, each holding sometimes as much as a ton of glass.

Glass does not become transparent as soon as it is melted. A white, opaque, porous scum, rises to the surface, and it is not until this has been cleared off that the glass is transparent.

The molten glass is cooled until it has become a consistent, tenacious mass, soft enough to yield to the slightest pressure, and able to be pulled and bent into any shape without cracking.

In making sheets of crown glass, such as is used for cutting into windowpanes, the melted glass is collected on a blowpipe and the workman gradually blows a globe. He then fastens an iron rod to the side opposite to that where the blowpipe is inserted, and takes the latter away, which leaves a hole. He now heats the glass again and begins twirling the rod. The glass yields to the impulse, its diameter increases, and it finally flies out into a flat disk 50 to 60 inches across, and having the rod attached to the center by a lump of glass, which is commonly known as the "bull's-eye."

In making plate glass great care has to be taken to select such materials as will insure the greatest clearness and the most ready flowing of the glass. These are fused in the ordinary manner, and afterward removed from the large glass pots to smaller ones. From these the fluid glass is poured out on large flat iron tables, which are heated before being used. A large copper roller is passed over the sheet of glass until the proper thinness is acquired. As soon as the glass is set it is carefully removed to the annealing oven, where it remains for about 15 days. The sheets of glass are then what are called "rough plate." To finish the plate glass it must be ground, squared and polished. The grinding is done by making a plate of the glass steady in a frame, and then causing another to rub steadily backward and forward on it, with some grinding substance introduced between them. At first, ground flint is used, and then as the roughness disappears, emery powder. When perfectly smooth, the sheets of glass are polished with leather cushions, dressed with a red oxide of iron, called colcothar.

Pictures the Life of Kentucky

(Concluded from page 9)

"Only two of these books have definite Kentucky backgrounds," explained Mr. Cassidy. "These are contained in 'Flute and Violin' and are 'King Solomon of Kentucky' and 'The White Cowl.' The scene of the two 'Kentucky Gentlemen' is partly in Lexington, and the residence and grounds of Madison C. Johnson, a distinguished Lexingtonian of a generation ago, supplied some of the local color.

"All of Dr. Allen's short and longer novels are located indefinitely in the Blue-Grass regions with that as a background. There is nothing more definite than his old neighborhood and his whole generation experience of the people and of the land. He has always worked in the spirit of the region, creating his own details. However, in doing this, he has carried in mind four or five Blue-Grass counties in most of his creations. In his writings, Dr. Allen seems nearly always to avoid localities and altogether has been intent upon capturing the spirit of the region which he has thereby made famous.

"James Lane Allen, more than any other man, has put Kentucky on the literary map of the world. Kentucky is for him a well of living water, whence he has made to flow a broad and beautiful stream of literature, which runs through the great part of the world, cleansing it, refreshing it, making it more beautiful and ethical, purer and nobler."

Visitors to Lexington are taken to the fine new public library, where a special alcove has been devoted to Mr. Allen. On the wall hangs his portrait, done by his friend, Orlando Rouland. The building stands on a site originally set aside by the commonwealth for the establishment of Transylvania University, the first institution of learning beyond the Alleghenies. It was in this university that Mr. Allen taught and he was a frequenter of the old Lexington library, which was the predecessor of the institution in which his portrait hangs. In the old Lexington library "he gathered his material and caught the inspiration which has, in making this section famous, made permanent and illustrious his own name as a man of letters."

Mr. Allen is a bachelor. At present he is living in a house on 75th street, New York, which he has taken to be near his sister who lives across the street. On his work table and on the walls are the books of the great masters of literature to keep him company.

On his desk was a letter from the library of Sorbonne, University of Paris, asking for a set of his books, a request which French writers consider a distinctive honor, and still a greater honor when this invitation comes to an American author. A German professor, living in Vienna, had written asking for the privilege of translating "A Kentucky Cardinal" and "The Aftermath." A minister in Liverpool wants data on Mr. Allen's life, to be used in an address before British Library societies.

Mr. Allen's short story, "The Ash Can," published during the past year, has been selected by Edward J. O'Brien as one of "The Best Short Stories of 1921," and will be republished with a collection of other best stories. Seldom has a short story evoked so much praise and attracted so much attention. The theme is based on the human tendency to dump troubles and worries on friends as one throws undesirables into an ash can. A friendly visit between a doctor and a bishop gives opportunity for a conversation which discloses this interesting drama in nature.

Dr. Allen is also writing a book of bird and animal stories, which will be dedicated to the children of Kentucky.

BRIEFLY TOLD

Many ruined cities of prehistoric civilizations which once flourished in Central America and Mexico are to be preserved as reservations and national parks. This action will preserve for all time some 50 cities, temples, pyramids and other monuments of the Maya races.

Anatole France, the winner of the Nobel prize, has given the entire $40,000 to Russian relief in the Volga district.

The favorite daughter of Count Leo Tolstoy is the leader of a movement to save the great writer's home. It is planned to make the estate a popular university, where the lovers of Tolstoy's creed may come and study.

The memory of messenger dogs that served on the battlefields of Belgium and France is to be perpetuated in a monument to be erected in the canine cemetery at Hartsdale, New York. The monument will consist of a war dog of bronze, in heroic size, with helmet and canteen. It will stand on a boulder overlooking a motor highway and a bronze tablet will bear a legend reminding posterity of the dog's part in the World War. The Hartsdale Cemetery covers four acres and contains hundreds of headstones, vaults and monuments to mark the resting place of pets.

Purchase of seven tracts of land in Europe for permanent American cemeteries was recommended recently by Secretary Weeks.

The year 1921 was the healthiest one in the history of the United States and Canada, according to the records of 37 leading American insurance companies.

Pacific Coast sea gulls show the antagonistic spirit toward the English sparrows along the wharves and docks of Seattle. The gulls drive the sparrows away because they fear competition in their daily quest for food.

The highest known inhabited house in the world is in a high pass in Tibet. It is a stone building occupied by a guard, and is 18,100 feet above sea level.

While his train was traveling at 25 miles an hour, a locomotive fireman on Staten Island, New York, jumped from the engine into a creek and pulled out a schoolboy, who had been struck by the engine and thrown into 15 feet of water.

Hawaii's new army insignia will be a green leaf on a red field, the leaf to be separated from its background by yellow piping. This insignia is to be worn as a shoulder patch by officers and men alike, on the left shoulder.

"Jewish Influence on American Life," Volume III in the series on "The International Jew," comprises a third selection of articles on the Jewish Question, and is now off the press. It contains 256 pages, and will be sent for the cost of printing and mailing, which is 25 cents.

"The International Jew," Volume I, and "Jewish Activities in the United States," Volume II, 235 and 256 pages, sent for 25 cents each.

A government artesian well at Lower Brule agency, in South Dakota, spouts blue clay instead of water. Before windy and stormy weather the clay issues at the top of the pipe like a gigantic sausage, rising five or six feet before toppling over.

Motion pictures of a big fox hunt in Monroe County, Indiana, were taken recently.

Chop suey has been introduced to Germans of Coblenz, who are said to like it. The idea of serving chop suey was conceived by an American soldier, who opened a small shop when his enlistment expired. Now the food, served with the characteristic Chinese trimmings, is popular with the natives.

Circulating libraries are to be placed on ships plying the Great Lakes, according to the Lake Carriers' Association. An officer on each ship is to have charge of the library for his vessel.

Wireless telephone stations are to be installed in all volunteer fire engine company houses in Allegheny County, Pennsylvania, and in the Pittsburgh Fire Department. In case of serious fires immediate communication throughout the Pittsburgh district and the county can be had at once.

"Los Angeles-on-Thames" might well be the name of a film city, which is springing up at Walton-on-Thames, England. Six large studios and other buildings are being erected on a fine old English estate. In the small kitchen of a house in Hurst Grove at Walton, Cecil Hepworth, the pioneer of British film production, made his first motion picture 21 years ago. The Thames Valley scenery is beautiful and is said to be well adapted to the industry.

Only from 9 to 12 per cent of the energy in a ton of coal is harnessed in a manner which actually will pull a train of cars.

There are no snakes in Bermuda.

A six-pound mackerel is capable of producing 1,500,000 eggs at one time and a 77-pound cod produces more than 9,000,000 eggs. A 23½-pound pollock, of the cod family, produces 4,000,000 eggs at one spawning.

More than 2,500,000 farms in this country are equipped with telephones.

A possible tax eradicator, a municipally-owned oil well, has started a flow of finances into the city treasury of Long Beach, California. A contract was made by Long Beach with a California oil company for the sale of 15,000 barrels of oil, the city's first allotment of the production. The well produces between 500 and 600 barrels a day, the operating company getting 60 per cent and the city the remainder.

Chief Justice Taft, of the United States Supreme Court, is just three days older than Associate Justice Clarke, their ages being 64. Justices Day and Van Devanter have the same birthday.

Mexico has adopted the standard time unit. The hours will be counted from 0 to 24, beginning at midnight.

"Q. S. T." in radio parlance means "everybody listen."

During a recent eruption from the volcano Caulle in the Andes Mountains a rain of ashes fell over a wide area adjacent to the volcano, seriously damaging crops. Steam poured from deep crevices in the mountainside during the eruption.

Chronic violators of road rules are to be rated by the Pennsylvania state police by means of punchmarks on their registration card. In this way every motorist will carry his record with him and the card will be a ready exhibit to the prosecuting attorney.

Between 350,000 and 400,000 new houses are needed in the United States every year.

The famous oyster beds of Puget Sound were recently threatened with extinction. Low tides, following a period of warm floods, exposed the beds to the freezing temperature, which proved very destructive.

Forty bales of human hair, to be manufactured into hair nets, was an item in the cargo of a Japanese ship which recently docked in Seattle.

The British Museum was started with funds raised by a lottery.

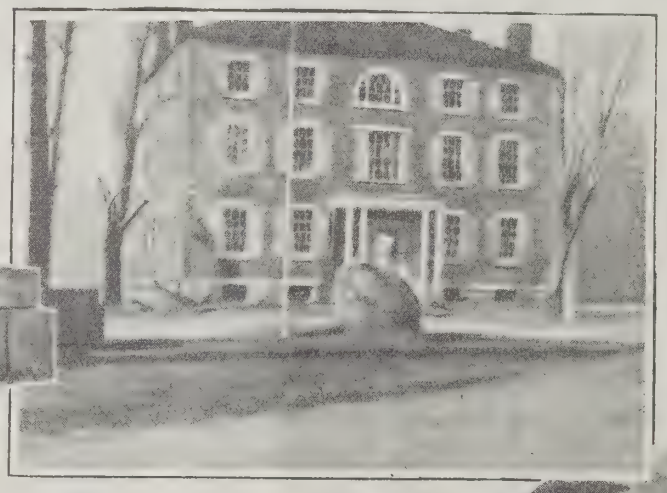
"Old Bet" and the Origin of the American Circus

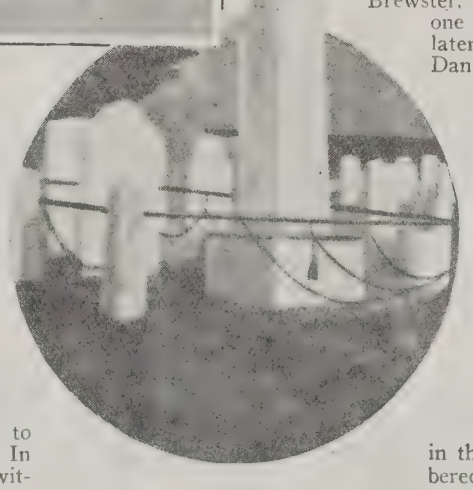
A Lone Elephant Blazed the Trail for the Great Shows of Today

By GEORGE S. BRYAN

TRAVELERS in Westchester County, New York, may have chanced upon the village of Somers and there may have noted the Elephant Hotel. This fine old Georgian structure of brick would be sufficiently impressive anywhere. It is of the sort that one might think of finding in Portsmouth, New Hampshire, or Salem, Massachusetts, but in this spot it is encountered with surprise. Linked with the inn are the names of Washington Irving, Horace Greeley, Ulysses S. Grant, and other eminent Americans; at a political mass meeting held before it in 1858, Chauncey M. Depew (at this writing in his eighty-seventh year) made, so he has informed me, one of his early speeches.



Just across the road from this stately building stands what is perhaps the quaintest memorial in the United States. It is a granite shaft, some 15 feet in height, surmounted by an iron scroll-work on which is fixed the figure of an elephant, carved in wood. The man who built the inn, about a century ago, also placed before it, like a totem pole, the elephant monument, thus at once providing his inn with a sign and commemorating "Old Bet." With this man, Hachaliah Bailey, and "Old Bet," his elephant, the American circus had its remotest beginnings. It has sometimes been said that "Old Bet" was buried beneath the monument, but this is incorrect. Neither is it true that she was the first elephant brought to the United States; for a New York newspaper of April, 1796, chronicles the arrival of the first elephant seen in America, and the earliest date claimed for "Old Bet" is 1815. Her advent was destined, however, to have a peculiar significance.



She was brought to America by a sea captain as a speculation; and, according to the best information I have been able to obtain, was purchased by one John Sloat, who in turn sold her to Hachaliah Bailey, a large landholder in Somers township. Hachaliah evidently believed that the War of 1812 being over, folk—especially in the small villages—would welcome so novel a spectacle as an elephant. From New York City "Old Bet" was transported up the Hudson in a sloop to Sing Sing (now Ossining) and thence driven by the stage route to Somers. Then and afterward she traveled by night, so that rural horses might not be frightened and that curious country people might not have a free glimpse of her. W. C. Coup, once among the best known of American showmen, has stated that subsequently "in Connecticut, there was a law prohibiting the driving of elephants through that state during the daytime without a license, the neglect to obtain which entailed a fine of $100, half of that going to the informer and half to the state. The law was passed in 1828, and, so far as I know, has never been repealed. This piece of information will doubtless astonish a good many showmen."

At Somers "Old Bet" was exhibited for a small fee in a barn. Then Hachaliah took her from place to place and showed her in barns or tavern sheds; usually charging an admission fee, but sometimes, it appears, depending on voluntary contributions, as itinerant exhibitors of monkeys and bears have done in our own day. (P. L. Ford tells us that George Washington left a record of having given nine shillings to a "man who brought an elk as a show.") Great, indeed, was the interest in this strange beast among the scattered communities, many of whose people had, it is likely, never so much as seen even a picture of an elephant. All through the Upper Westchester region, and in the adjacent Putnam County, "Old Bet" became generally talked about; and Hachaliah Bailey's venture prospered. About 1821 "Old Bet" died. Among circus men the tradition long persisted that she was shot—in malice, said some; others, by an experimentalist who wished to test whether a bullet would really pierce her hide. However that may have been, in 1825 Hachaliah opened the Elephant Hotel, and about 1827 he placed the "Old Bet" memorial on the strip of green close by the Peekskill road. The carved figure was originally gilded, but now wears a coat of drab.

In Hachaliah's day, Somers (Somers Plain, the natives called it) was busy and thriving. It was the chief source of the supply of butchers' meat for New York City, only 50 miles away. From as far as Ohio, large flocks of sheep and great herds of cattle were driven to Somers; and on the excellent pasturage in that neighborhood they were fattened for the wholesale market. Through Somers in winter passed stages between New York City and Albany. Hachaliah ran a stage line from Danbury, Connecticut, connecting in summer at Sing Sing (Ossining) landing with a steamboat for New York, and in winter covering the entire distance to the city. In a room of the Elephant Hotel was opened the Farmers & Drovers Bank, one of the banking institutions that sprang up under the "free banking" system inaugurated in New York by an act of 1838. It is not so many years since this bank closed its doors; and in the banking room may still be seen the primitive safes, doubtless considered marvels in their time. Three other taverns, besides the Elephant, once flourished in Somers.

In 1845, Hachaliah Bailey, who unharmed had managed an elephant, died as the result of the kick of a horse. Marking his grave in the Union

Left—The "Old Bet" memorial, one of the quaintest monuments in the United States. It stands just across the road from and in front of the Elephant Hotel. Above—The stately Elephant Hotel, built by Hachaliah Bailey and conducted by him for many years. Right—Monument marking Hachaliah Bailey's grave in the Union Cemetery at Somers, New York.

Cemetery at Somers is a plain granite shaft inscribed:

Hachaliah (sic) Bailey
Died September 2, 1845
Aged 70 years.

Enterprise.
Perseverance.
Integrity.

An excellent trio of qualities, this, to be attributed to any business man! In about 30 years Hachaliah had witnessed many steps in the development of the American "rolling show" from the initial impulse that he had given.

From the accretions of legend I have been able to separate several facts regarding our native circus in its real pioneer days. It began with the menagerie business. In Hachaliah Bailey's part of the country were several men of enterprise who were not slow to learn from Hachaliah's experience with "Old Bet" that isolated dwellers in country villages and small towns would be glad of amusement brought to their very doors, and that exotic animals had a great drawing power for show purposes. Among the very first of the menagerie showmen were Gerard Crane, of Hachaliah's home town, and Gerard's brother, Thaddeus. Gerard Crane was born in 1791 and lived until 1872. Nathan A. Howes, from the township of Southeast, in Putnam County, New York, afterward became a partner of the Cranes in the menagerie enterprise. In 1831 these showmen crossed the barrier of the Allegheny Mountains and journeyed southward to Mobile, Alabama.

"Nate" Howes and Aaron Turner in 1826 started the first American road company for acrobatic displays and feats of horsemanship to appear under full-top canvas. Previous to that, performers had given shows either in theaters (as vaudeville acrobats do now) or other buildings; or else within side canvas put up in some convenient spot—often in tavern yards. The completely tented show is admittedly of American origin. The Cranes subsequently became associated with John June and Lewis Titus, of North Salem, and then with Isaac Van Amburgh, once widely celebrated as a lion tamer. Titus and June were among the first American showmen to import wild animals, instead of buying them from ship captains in the way that "Old Bet" had originally been purchased. Other early showmen from this region were Chauncey Weeks, of Carmel, who from 1833 to 1836 traveled through the Eastern United States and in Canada with a menagerie, of which he was a part owner; Purdy, Welch & Company, from the vicinity of what now is called Purdy's Station; Raymond, of Carmel; Angevine, Quick, Smith, and many whose names have been quite swallowed up by time.

The menageries and the companies of acrobats and equestrians, with their clowns and musicians, began to travel together; but not until 1851 were both shown in combination at one time and for one price of admission. The main reason for this throws an interesting side light on our social history. People flocked to the performances of human skill and grace, just as they did to the exhibition of strange animals.

To get the trade of the pious, the showmen avoided the use of such terms as "show" and "circus," and advertised a "Great Moral and Educational Exhibition," or styled the entire outfit a "menagerie." It was in this tradition that the hippopotamus was billed as "the blood-sweating behemoth of Holy Writ" (although it may, in passing, be remarked that the description of the behemoth in the fortieth chapter of Job says nothing whatever about the sweating of blood). The exhibition of the animals was a separate affair, held by day only (sometimes on Sundays); and thus the showmen kept the patronage of the saints.

For many years, winter quarters for old-time rolling shows were at Somers and at Starr's Ridge, immediately east of the present village of Brewster, Putnam County. At one time Daniel Drew, later known as "Uncle Dan'l," partner of Jim Fisk and Jay Gould in many of their notorious transactions, was a "general utility" man for Nathaniel Howes. Drew was a native of Carmel. About 1850 Seth Howes, Nathaniel's brother, and Phineas T. Barnum brought from Ceylon the first elephant herd seen in this country. It numbered 10, and great interest was aroused by it. Seth Howes, with Henri Franconi, of the Paris hippodrome, as a partner, in 1853 opened in New York City the first "Roman hippodrome" in the United States, on ground of which part was later occupied by the Fifth Avenue Hotel and is now the site of the Fifth Avenue Building (200 Fifth Avenue).

Some of those early circus men lived to advanced ages—Gerard Crane, for example, to be 81; Nathaniel Howes to be 82. Gerard Crane's square, substantial house of cut stone is still to be seen, about a mile north of Somers Plain village; and so, too, is Seth Howes' residence on Turk's Hill, close by Brewster. All the better-known old-timers from this region were factors in the development of the American circus from its primitive beginnings to the elaborated stage of Barnum's "Greatest Show on Earth," now consolidated with Ringling Brothers.

Raising Apples Where Only Sagebrush Grew

ONE small district in the state of Washington, equal to only a township and a half in area, produced approximately a fifth of the commercial apple crop of the United States in 1921. One little valley, only 35 miles long and containing only 30,000 acres of orchards, produced 16,000 carloads of apples, a crop valued at $25,000,000.

The apples from this small area exceeded the crop of the entire state of New York, until a few years ago the leading apple state. It exceeded the apple crop of Colorado, California, Oregon and Idaho combined.

Yet, some 20 years ago, this district was little more than a desert covered with sagebrush.

The answer is—irrigation. Irrigation has turned the Wenatchee Valley into one of our newest and richest apple lands. Three hundred trainloads of big red apples—that represents Wenatchee's contribution last year.

Wenatchee apples go to all sections of the country. If you were to walk into the Grand Central station in New York and buy an apple at a confectionery or fruit stand, the chances are pretty good that it would be a Wenatchee apple. Apples are shipped across the entire country to New York City and sold there in successful competition with eastern apples. The chances are that you wouldn't find a New York apple on that stand in the Grand Central at all. The big red apple of the West is preferred.

Wenatchee has been stamped firmly on the consciousness of the apple-eating public. Advertisements in the big city dailies, inserted by a co-operative association of growers, have heralded the coming of apples from the "mountain-guarded orchards of Wenatchee," and enticed increasing numbers to eat the big red apples of the West.

The name Wenatchee has become well known, but the story of Wenatchee is not so well known. That story, reaching back somewhat more than 20 years, forms one of the most eloquent illustrations of what the reclamation of the arid lands is doing for the West. It shows, too, the possibilities that lie in yet undeveloped agricultural empires in arid regions of the West.

Albert B. Fall, Secretary of the Interior, in his annual report for the fiscal year of 1920-21, issued recently, gives a significant review of the results of irrigation. Within the government projects, there are now 32,835 irrigated farms, with a population of 125,214. Between 1900 and 1920, population of the towns within these projects increased from 77,602 to 324,289. The number of banks increased from 45 to 247. Deposits of the banks jumped from $10,310,686 to $143,539,856, and the number of depositors increased from 30,645 to 283,876. This remarkable growth, he attributes chiefly to irrigation.

Nor do these figures take into account the private irrigation systems. In other words, they do not measure the extent of results from irrigation. But they do suggest most effectively the trend of growth in these new empires that are being reclaimed.

But to get back to Wenatchee and its apples—the Wenatchee district lies roughly in the center of Washington, some 160 miles east of Seattle. It spreads over broad flats on both sides of the Columbia River and up the Wenatchee River. Great mountains wall in the little valley.

When the Great Northern railroad was built into the district in the early '90's, the land was covered with sagebrush and seemed worthless. Settlers came with the advent of the railroad, however, and tried to till the soil. They dug rude irrigating ditches, installed water wheel pumps on floats anchored in the Columbia and set out some apple trees along with other crops. After a few years they discovered that under irrigation the volcanic ash soil produced an apple of unprecedented bigness and redness. That color, a peculiar characteristic of the western apple, due to climatic conditions, later was to become a decided asset.

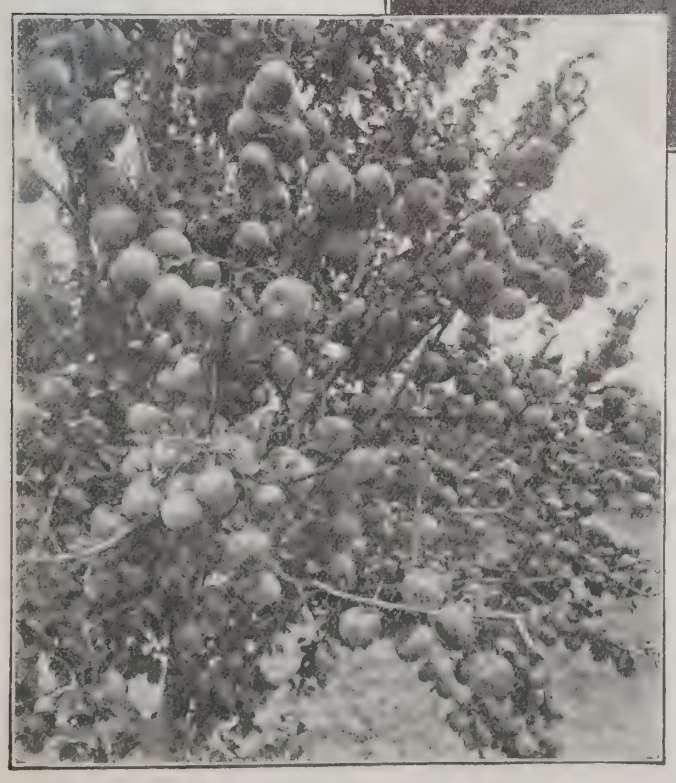
The soil and climatic conditions seemed suited to raising apples, but getting water was the question. There were many discouragements. Finally, with the assistance of James J. Hill, an irrigation ditch was excavated from the Wenatchee River, reclaiming 1,500 acres. In 1903, irrigation works on a large scale were completed, and development followed more rapidly.

In 1902, only two carloads of apples left Wenatchee. In 1903, 116 carloads were sent out. Gradually the number increased until in 1910, there were shipments of 2,791 cars. From then on, the Wenatchee growers climbed rapidly up the ladder. By 1918, they had become an important factor in the box apple business, shipping 8,624 cars. In 1919, the production reached 11,850 cars, and in 1921, even this record was broken, with shipments of 16,000 carloads, more than produced by any other state.

Today, the Wenatchee district is one vast orchard. In the spring, blossom-laden trees fill the valley, while the snow-covered Cascade Mountains stand guard in the distance. In the autumn, the peaks catch the snowfall, and, as in the spring, tend to protect the orchards below from too sudden changes in temperature.

The district has a mild and uniform climate. The summers are hot enough to mature the fruit, and, due to the mountains, there are few frosts or other extremes.

Though raising other fruits, the growers in the Wenatchee district have specialized in apples. Adding scientific horticulture to irrigation and natural advantages, the community has concentrated efforts toward the production of the perfect big red apple. The Wenatchee growers explain that the mountains and the foothills catch the early autumn snow, which does not reach the lower orchard lands. This gives the autumn nights of the valleys a frost-laden breeze which oxidizes but does not freeze the coloring matter of the fruit skins and develops the rich red and delicate tints, which continue to increase during the warm days.



Anyway, nature has provided a rare coloring for the apples that grow in the valley, and it commands a premium in the markets of the world. When a man picks out an apple to eat, he is very apt to select the one with the richest color, dealers have found. Wenatchee apples are marketed not only in all parts of the United States, but they go to Europe as well. They go to South America, to the Orient and Australia in large numbers. One big selling agency not long ago placed an order in Europe for 1,000 carloads.

The industry has been placed on an advanced business basis. A rigid system of inspection and state supervision has been provided. The commercial ap-

The New Pope and Peace

THERE is every promise that the new Pope will prove a forward-looking leader of the Roman Church. Immediately upon his accession—despite the advice of the more conservative cardinals, it is said—he made a gesture eloquent at once of a decided and determined will of his own and of an extremely liberal mind. He stepped without the bounds of the Vatican to the balcony of St. Peter's to bestow the apostolic benediction on a waiting crowd numbering more than 100,000 persons, and symboling to him not only the 100,000,000 Roman Catholic communicants throughout the world, but humanity of all faiths. No Pope before him in 50 years had crossed the Rubicon of protest against Italy's rule of Rome, the tradition handed down from Pius IX's days of the "prisoner of the Vatican."

"Universal pacification" is declared to be the keynote of his policy and one of his reasons for choosing the name of Pius is that it means peace. His character is built of a useful blend of the cloister and the field. Early in his career when he was active in what might be called social welfare work among the children of the poor, and later as archbishop, he came into close contact with the sometimes turbulent industrialism of Milan, gaining from that contact a democratic bent that brings him decidedly into line with the life of today and its practical demands. Author, scholar and Alpine climber, he is not only a great theologian, but also a scientist of distinction and a statesman and diplomat of the new school. In a conversation with Cardinal O'Connell, of Boston, he has expressed great admiration for the United States and its institutions, as well as high appreciation of the results of the Disarmament Conference.

In his handling of the delicate and difficult task assigned to him as Special Ecclesiastical Commissioner in Poland during the war and later as Papal Nuncio to the Polish Republic, he displayed a remarkable gift for the reconciliation of opposing elements. He is said to enjoy the confidence and friendship of the French, yet he succeeded in toning down Gallic belligerency in the Upper Silesia controversy. All accounts agree that he is more than disposed to carry forward to completion the policies initiated by Pope Benedict that look to the restoration of a friendly agreement with the Italian Government and to the reunion of the eastern and western branches of the Catholic Church.

The High Cost of Banking

ACCORDING to returns from the nearly 8,000 national banks reporting to the Controller of the Currency, it costs these banks an average of $59 a year to handle every $1,000 of deposits. The rate varies all the way from $40, the lowest, in California, to $74, the highest, in Texas. This is certainly a rather steep overhead load on the business of the country, the banks acknowledging the harvesting of a net profit averaging $27 on every $1,000 of deposits over and above this cost of an average of 5.9 per cent.

It would be interesting to have an itemization of this "cost of handling" deposits. How much of it goes for palatial marble banking houses, mahogany furniture and oriental rugs? How much to big salaries of decorative "officers"—and how little to salaries of clerks and bookkeepers?

The percentage of profit seems small. But it should be remembered that it is profit on other people's money. The deposits represent approximately 20 times the banking capital invested, on which dividends of from 30 to 60 per cent are often paid, after setting aside to surplus and undivided profits portions of earnings that in short order equal or surpass the amount of the original capital. It is no wonder that bank shares command—when they are obtainable at all—premiums of anywhere from 100 to 1,000 per cent.

During a recent congressional inquiry into agriculture, it was brought out that agricultural credit banks in Germany, handling many millions of dollars' worth of loans, succeed in transacting their business safely and successfully at an expense cost of less than 2 per cent. In the face of this showing, the special congressional commission recommends an amendment to the Kenyon Rural Credits Bill, which is based on the successful German system—an amendment that proposes that the credits shall take the shape of deposits in the national banks instead of being handled by cooperative organizations of the farmers themselves.

When Charles E. Hughes conducted the life insurance investigation that marked the beginning of his brilliant career and worked a revolution in insurance methods, the premium-paying public was startled by the exposure of flagrantly extravagant expenditures for overhead and "incidentals" that increased the cost of insurance to the policy holder—and diminished the security for his investment—all the way from 40 to 60 per cent. Perhaps a similarly fearless and efficient investigation of banking methods today would bring out similarly interesting disclosures.

But where is there a Charles Evans Hughes capable of putting through so beneficial an inquiry into the actual costs, compared with the charges for banking service to the community?

Back of the Screen

FURTHER revelations concerning the actual life of the motion picture colony are brought to the surface by police investigations of the murder of Taylor, or Tanner, a star director responsible for many of the films that are typical of the sort of thing that has aroused the indignant protest of decent people. There were many who found it difficult to believe the cold facts as to the utter debauchery of mind, morals and environment characterizing the center of the movie industry in California that were brought out in the pages of THE DEARBORN INDEPENDENT some time ago. The Taylor scandal, following the nauseousness of the Arbuckle case, more than confirms the indictment then drawn. In fact, it is now plainly recognized that our picture of revolting habits and tendencies among the makers of movies was an exceedingly restrained statement.

The present revelations, for one thing, explain the prevalence of a startling and insidious eroticism in the pictures now spread before the American public with a pervasiveness which only the miracle and the ubiquity of the motion picture screen make possible. No stream can rise higher than its source. Recent events proclaim the nature of the fount from which emanates these pictures.

"United Statesers"

THIS is the monstrously grotesque designation that has been worked out by certain imaginations for citizens of this United States of America. It has been offered as a solution for the wholly imaginary problem presented by the fact that there are other nations than ours on the American continent. "Why should citizens of the United States," it is asked with an air of superlative wisdom and finality, "arrogate to themselves the name of 'Americans' when there are 22 other nationalities equally entitled to be considered as Americans; is not a Canadian, a Mexican, a Peruvian or a Brazilian equally an American?"

This reasoning from a false premise so far impressed our State Department at Washington that at one time during the Wilson Administration "United States" was substituted for "American" on the stationery of our embassies and legations. After a short experience, the order was revoked and the legend "American Embassy" was restored to its rightful place. It was found that the stupid amendment led to confusion and question. Had we forgotten the United States of Brazil and the United States of Mexico?

In a sense, all the denizens of the Western Hemisphere are Americans, as all the races and nations of Asia are Asiatics. But accurately speaking, as in common parlance, the people of the United States of America are alone entitled to the national designation "American," for the good and sufficient reason that alone among all the nations of this continent, the correct official name of our nation contains the word "America."

Everyone understands what we mean when we talk of the American Commonwealth, the American Spirit, American Inventive Genius or American Art. The adjective has a well-earned and quite distinctive connotation. It cannot be improved upon.

"Supply and Demand"

ONE of the fictions in regard to the prices given by consumers and to producers of the necessities of life is that they are fixed by the natural law of supply and demand. Stock exchanges, boards of trade, curb brokers and other gambling agencies by which the bulls and bears manipulate prices have the greatest influence on prices.

It is not necessary that either buyer or seller in the speculative market handle the commodity in which he is "dealing." During the Civil War men in every city, village and hamlet "bought" and "sold" gold when there was not an ounce of that metal to be found outside the vaults of the eastern banks, and none actually for sale. These transactions were purely a gamble, men neglecting business to wager on the daily shift. The business is as surely a game of chance as any game at cards.

It is worse. The man who stakes his money at cards merely risks that which is his own, only himself and those dependent on him being immediately affected. He who gambles in the necessities of life, in industrial stocks, or in any way on the stock exchange dabbles in the very life of the people.

To be sure, the loser in a grain transaction has opportunity to save a part of his wager if he can secure and deliver the goods more cheaply than the cost of paying the wager, but that is rarely done.

During the World War this country paid an enormous tax on the speculation in sugar. With immense supplies rotting in Havana, with capital and tonnage kept out of competition because the maritime control was in the hands of one group, there was claimed to be a great shortage. Especially in the canning season, when domestic consumption was at its height, the housewife was robbed in the retail prices. Sugar that could have been sold at a profit at a slight advance from pre-war figures could not be had for five times as much except in limited quantities.

But the inevitable break came and found every warehouse full of sugar, and every broker eager to evade cancellations. One day, refusing to accept business at a specified price, the next day the wholesaler demanded acceptances of consignments at the high figure prevailing when the order was entered.

The truth is that *there has been no time when the supply of necessities has not been equal to the demand,* and it is equally true that the natural law has not been operative because of the cupidity of men able to control.

The same interference with legitimate industry is prevalent. Even the banking business itself is affected. When two Chicago banks were absorbed by rival interests we were told their depositors "were saved." That is a good thing. But "the Tilden interests were wiped out." That was not good at all.

In every line of industry the same struggle is to be seen. Sales of industrial stocks are not really sales, only gambling on the prospects. The stocks may or may not represent actual investment. Few do today. Many depend on bonds for running expenses, and the stockholder is taking chances of realizing on his money. But the effect on the industry is plainly bad.

Meanwhile, with the law of supply and demand inoperative through the ability of big business groups to control business of every nature, the world looks to big business for relief from the consequent evil conditions. The farmer seeks aid in loans that will only tighten the chains of his slavery, the manufacturer seeks a restriction of competition by high import duties, and the international financiers become more and more the masters of the world.

The Single Tax in a Nutshell

A BROOKLYN reader, expressing appreciation of recent comment on this page concerning the Oregon Single Tax campaign, sends us this condensed and simple definition of the Single Tax:

> The Single Tax means the abolition of every tax now levied on the people of the United States, and the collection of the entire rent of land, exclusive of improvements, for Federal, state and local expenses.

This is certainly to the point and may serve as sufficient answer to many requests coming to us for a brief explanation of the movement.

Just now, Single Tax Party bulletins are bidding for the support of ex-service men by calling for the payment of the bonus out of ground rents. Better than any cash bonus would be the benefits accruing to ex-service men, and the rest of us, by the increase of employment at good wages, the bringing of more land into profitable use, and the stimulus to building and other industries that would follow the exchange of our present burdensome taxation on all industry and enterprise for a single tax that would absorb the unearned increment of land values.

Mr. Ford's Page

THE mystery of money exists by reason of a conspiracy to keep the truth in the possession of the few, and to prevent the public ever dabbling in it. The fear seems to be that if the public mind ever arrives at the condition where it can move easily about among money facts, the régime of money control is doomed. The fear is well founded. That is probably the way in which such knowledge would operate.

This, of course, is not the same fear that others hold, namely, that the people will act without adequate knowledge, and thus cause disaster. That is quite another kind of fear. But it is one which suggests its own remedy. To prevent the people acting without knowledge, the only thing to do is to provide them with knowledge. If you try to prevent their action you will only precipitate it.

There is perhaps in every county in this broad land a man, or perhaps a dozen men, who have a money system of their own planned out, all cut-and-dried and ready for use. Our rulers hardly understand how deep and continuous a hold this question maintains upon multitudes of minds of all degrees of power. But a glance at most of the systems shows how contradictory they are. The majority of them make the assumption of honesty among mankind, to begin with, and that, of course, is a prime defect. Even our present system would work splendidly if all men were honest. As a matter of fact, the whole money question is 95 per cent human nature; and your successful system must check human nature, not depend upon it.

However, the money masters ought to consider that little fact, no bigger than a small cloud on the horizon at present, that the people are thinking about the money question; and if the money masters have any information which they think the people ought to have to prevent them going astray, now is the time to give it. The time is fast slipping away when the fear of credit curtailment will avail, or when wordy slogans will affright the people; these are the very things which are pushing the question to the fore.

One very solid fact should be known: *the people are naturally conservative.* They are more conservative than the financiers. If the people knew what tricks financiers play with the money function, the conservative populace would seriously deprive money of that quality which gives it social value, namely, public confidence. Persons who pretend to believe that the people are so easily led that they would permit printing presses to run off money like milk tickets, are only pretending, or they are densely ignorant. It is the innate conservatism of the people that has kept our money good in spite of the fantastic tricks which financiers play, and which they cover up with high technical terms.

So, you have the people on the side of sound money before you begin. Perhaps that is the reason why certain groups do not wish to begin. The people are so unalterably on the side of sound money that it is a serious question how they would regard the system under which they live, if they once knew what the initiated can do with it.

It is a notable fact that the American people have never been fooled on the side of unsound money.

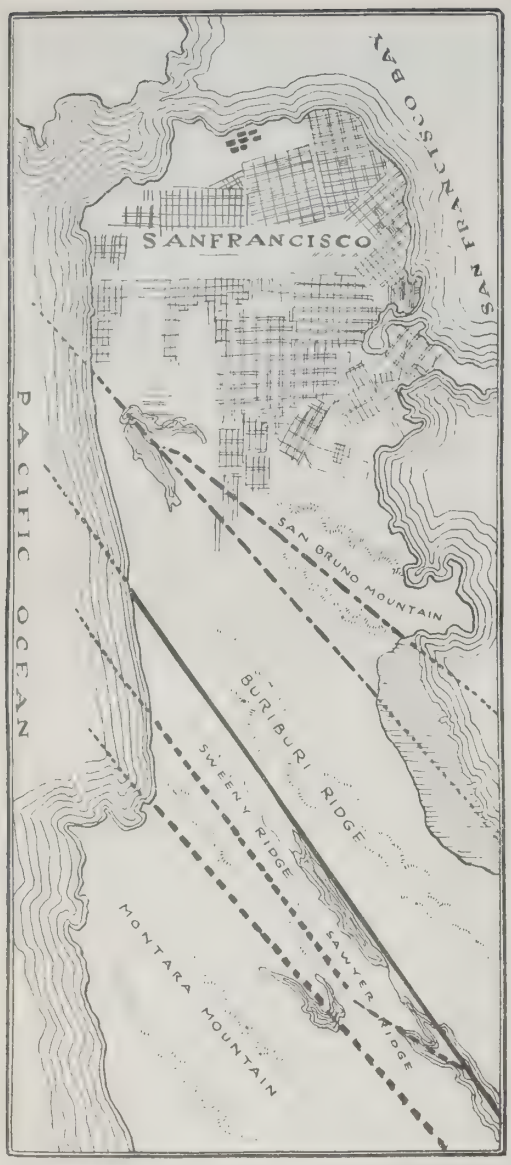
The same instincts which have saved them from being deceived have also prevented them from being led out into a wider monetary freedom. Their cautiousness has worked both ways. But the cautiousness is there, which fact should calm the cries of those friends-of-the-people propagandists-for-the-interests who fear that the people may be led astray.

Here is another fact: the present money system is not going to be revamped under some inspiring leadership persuading the people that it is the proper thing to do. That is, it is not going to be the result of speech-making nor political sensationalism nor economic experiment. It is going to come under the pressure of conditions, conditions which we cannot control, and pressure that we cannot control.

Those conditions are upon us now; that pressure is upon us now; and the whole desirability of the people being not only awake to the money question but also fully informed upon it, is to enable them to guide themselves in the pressure so wisely that the new matrix may be a better one.

The money question is not a personal, partisan or class question. It becomes so only when it serves selfishness. When you see or hear loud cries coming up against any mention of the money question, you may be sure that someone is being hit in a private interest. It is not the money question that the cry concerns, it is someone's unfair interest in some phase of the present system. There is no need of personalities. Bankers are not to blame, they are not the originators of the system, though they may be in some respects the special beneficiaries of it. Most bankers are as much confused by the situation as are other people. To know how to run a bank does not necessarily imply knowledge of the money system in its profounder reaches, any more than running a corner dry-goods store makes one a textile technician. It is easy enough to take a target like "banker" or "Wall Street" and bang away at that, but it doesn't get us anywhere. There are bankers, of course, who see the whole fallacy of our money system just as clearly as the shell-game man sees the trick he is turning. There are statesmen also who see the burden thus being laid upon all the people. These are the men who are morally culpable, but they are not to be feared, they themselves are part of the old system which is to be swept away.

The people must be helped to think naturally about money. They must be told what it is, and what makes it money, and what are the possible tricks of the present system which put nations and peoples under control of the few.



Money, after all, is extremely simple. It is a part of our transportation system. It is a simple and direct method of conveying goods from one person to another. Money is in itself most admirable. It is essential. It is not intrinsically evil. It is one of the most useful devices in social life. And when it does what it was intended to do, it is all help and no hindrance.

THOSE who pretend to fear that the people can be led away by any new money craze that appears, do not know the record of the people. They are for sound money more than the juggling financiers are; and they know what sound money is. A column of figures in a book is not money, and paper profits are not wealth, and heaps of gold have not proved essential to the prosperity of a nation. The people know that. There are many things "impossible" within the old out-worn circle, which will not only be possible but necessary and desirable in the new circle. There are certain unsound elements in the present system, and as soon as the people find it out they will make a change in the direction of greater soundness. That is what some private beneficiaries of the present system fear.

But money should always be money. A foot is always twelve inches, but when is a dollar a dollar? If ton weights changed in the coal yard, and peck measures changed in the grocery, and yard sticks were today 42 inches and tomorrow 33 inches (by some occult process called "exchange") the people would mighty soon remedy that.

When a dollar is not always a dollar, when the 100-cent dollar becomes the 65-cent dollar, and then the 50-cent dollar, and then the 47-cent dollar, as the good old American gold and silver dollars did, what is the use of yelling about "cheap money," "depreciated money," for that is exactly what we have had, and didn't know it. A dollar that stays 100-cents is as necessary as a pound that stays 16 ounces and a yard that stays 36 inches.

When you can give the American people more money than they ever had before in their lives and still make them poorer thereby than they ever were before, it is something of a joke to try to evade the question and point to "the printing presses of Germany and Russia." The same system that dropped them, dropped us also, but not so far.

The San Francisco peninsula, in California, showing the five ancient faults, made by earthquakes of long ago, and indicated by broken lines, and the comparatively modern fault of 1906, appearing as a solid black line, passing through the San Andreas Valley and Lake. It is on both sides of this rift that the experiments are being made to provide data for the forecasting of future earthquakes, just as changes in weather are forecast.

A lake formed in the Mohave desert, by the subsidence of the earth's crust along an earthquake rift. The water was forced up from sources beneath by the tremendous strain in the crust of the earth.

Earthquakes Can Be Foretold

Method Discovered That Makes Possible the Forecasting of Seismic Disturbances

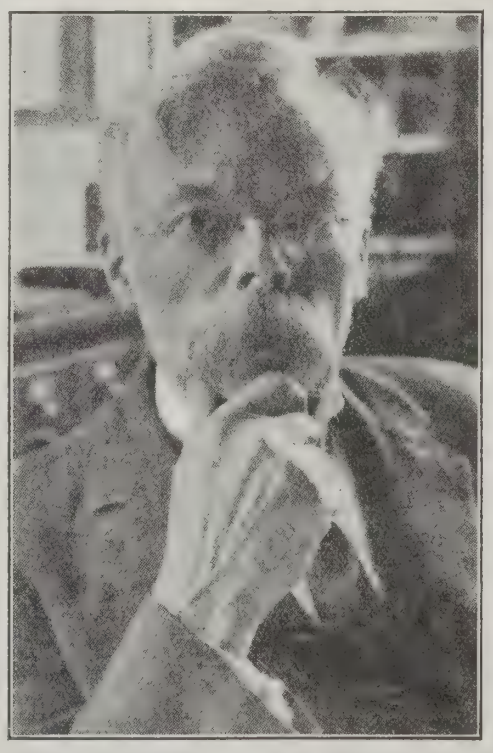
By ROBERT MORGAN

BY THE combination of three recent discoveries, each of which, in itself, is not of great importance to the man outside scientific circles, Dr. Andrew C. Lawson, professor of geology at the University of California, has made an astounding discovery. He has found a method whereby the time and place of earthquakes anywhere on the surface of the globe may be forecast with the same accuracy as changes in the weather are now forecast. While there is no known method of preventing an earthquake, no matter how far in advance the world may be advised of its coming, nevertheless, such prediction, accurate as to time and to place, would, if made public, save thousands of lives by enabling the people to leave the threatened zone, and millions of dollars in property, by enabling the people to prepare to combat conflagrations which usually follow disastrous seismic disturbances. Forecasts of earthquakes will not be made public, according to Dr. Lawson, for the main reason that scientists would not dare so to reveal their discoveries of coming seismic disturbances.

"Suppose we predicted an earthquake, and, by some chance, it failed to arrive on schedule," said Professor Lawson. "Then the people would form a vigilance committee and come up and lynch us. Suppose, on the other hand, a lot of nervous, impressionable people visualized a great catastrophe from one of our predictions; then we would have a reign of terror. No, we would not dare to tell the world what our instruments are recording. It is safer in our own keeping."

The most interesting feature of this great cumulative discovery is that the coming earthquake is made to tell on itself. In other words, the surprise element, the unexpectedness of its approach, is taken from the temblor, and the date and place where it will strike can be foretold months, possibly approximately years, ahead of its actual arrival, for the coming of the earthquake, unlike that of the hurricane, the typhoon or the cyclone, is a long-continued affair. The final rebound, which breaks the crust of the earth and sends vast areas slipping this way and that, is approached slowly, and by degrees which can be studied, charted, photographed, diagrammed and tabulated. The work of preparing the data on which earthquake forecasts are based is a great deal more arduous and much more delicate than the forecasting of storms, or other changes in climatic conditions, but it follows as regular lines as do weather forecasts, and its bases are so obvious that the great wonder is that man has not discovered them before.

The three original discoveries on which Dr. Lawson bases his announcement of the forecasting of earthquakes are as follows:



1. That the crust of the earth is constantly moving, usually northward, at the rate of a few feet each year. This motion is known as "strain creep," and is due to the fact that the earth does not run true on its axis; that is to say, the North Pole, in rotating, creates a 60-foot circle, instead of running on a center, as does a shaft in its bearings. This wobbling about of the pole causes the creep in the earth's crust.

2. That when this strain creep has created a certain tension, reached a certain limit of stretch, in other words, in the material of which the earth's crust is composed, that material—that is, the crust—gives way at its weakest point, known to geologists as a "rift" or "fault," and there is an earthquake.

3. That the rate of strain creep of the earth's crust; the composition of that crust, and the breaking limit—that is, tension point—of the materials composing that crust, which differ greatly in different localities, all can be ascertained with accuracy.

Taking these three factors, Dr. Lawson's own discoveries, the scientist very soon saw that he had the earthquake cornered where it had to tell on itself. With the rate of strain creep, and the amount of strain the crust of the globe will endure before breaking, the geologist is able to figure exactly how long the crust of the earth will endure that strain before the "elastic rebound" sets in and the crust breaks. It has been known for years that the latitudes of many supposedly "fixed" points on the surface of the earth are changing, gradually moving northward. The only way the exact position of these, or any other points, on the earth's surface can be fixed, of course, is by astronomical observation and calculation.

Dr. Lawson discovered, however, that the "creep" of the earth's crust is going on all the time, that it is antecedent to, as well as consequent of, earthquakes. Therefore, like the flow of a river, the flow of this mass of earth and stone ever to the northward, can be measured. Sometimes such a flow is much accelerated by the "elastic rebound," known to the layman as an earthquake. For example, Mt. Tamalpais, a peak some 2,000 feet high, northward across the Golden Gate from San Francisco, moved 3.04 meters (approximately 10 feet) in a north-northwesterly direction, from 1854 to 1906, due to strain creep. In 1906, in the few seconds of the earthquake of April of that year, it slipped back 1.97 meters, rather more than half its 52-year creep, but in a south-southeasterly direction, not in line with its previous advance.

DR. ANDREW C. LAWSON,
Who has discovered a method of forecasting earthquakes.

The lighthouse on the larger Farallon Island, of San Francisco, was found to have crept 2.06 meters (about six and one-half feet) northwestward between 1860 and 1906, and then, in the earthquake of 1906, to have slipped back 1.29 meters, but this time almost due west of its new position. In other words, the whole of the Farallon Island, and probably all the islands of the group, made these two movements. Chaparral, another point of observation, moved almost as far during the brief period of earthquake in 1906 as it had by strain creep in the 50 years preceding. The movement by creep from 1856 to 1906 was 2.61 meters at Chaparral, and the movement back, in a southwesterly direction by elastic rebound, in 1906, was 2.06 meters. Other places, and whole groups of places, moved similarly, but in varying directions. From all these movements, and the data concerning them, order has been worked, and the figures tabulated, furnishing the basis for the calculation of the time and place of other similar elastic rebounds, should any ever appear in that section.

One of the important factors, of course, in all these observations and studies, is the difference in soil characteristics, the difference in the composition of the crust of the earth. In some areas, the crust is so composed and constructed that it will endure a much greater degree of tension, strain creep, than will other areas, since some forms of rock and some compositions of earth will endure more strain than others before giving way at the breaking point. When it is considered that some earth movements are of such vast weight as to be almost incomprehensible, and others comparatively limited in area and depth, the very close observation and calculation necessary places the new method of forecasting on a par with the study of the most distant stars. In the seismic disturbance of April, 1906, on the California coast, for example, an area of approximately 15,000 square miles, moved to a maximum depth of 65 miles. That is to say, about 975,000 *cubic miles* of earth moved, and its movement at some points was as much as 24 feet, lessening, as the distance of the point from the main rift or fault increased, to one foot.

So important does the University of California regard this discovery by Dr. Lawson that the Board of Regents has appropriated $4,000 for the purchase and installation of a special instrument for the work in the Lick Observatory of the university, on Mt. Hamilton, and stations for the observation of the strain creep along the famous San Andreas rift have been established and observations are being taken there daily. On Mt. Hamilton, observations are made nightly, while at Ukiah, other observations of the strain creep of the skin of the world are being taken both day and night. The instrument to be installed on Mt. Hamilton is a Ross photographic latitude telescope, which, by photographing the results of its automatic observations, eliminates to a large extent the factor of human error found in the results of visual observations. Dr. Lawson, W. W. Campbell, director of the Lick Observatory, and R. H. Tucker, astronomer there, are making continuous studies of the earth movement all along the Pacific Slope, tabulating the result and thereby establishing records from which all necessary

How Earthquakes Are Classified

TO MOST people, an earthquake is merely an earthquake, and, if they escape from one, that is all there is to it. But the geologists and the students of seismography graduate the intensity of their earthquakes by the Rossi-Forel Scale, which divides the temblors into the following classes:

Perceptible, only by delicate instruments; very slight, shocks noted by few persons at rest; slight shocks, of which duration and direction were noted by a number of persons; moderate shock, reported by persons in motion, shaking of movable objects, cracking of ceilings; smart shock, generally felt, furniture shaken, some clocks stopped, some sleepers awakened; severe shock, general awaking of sleepers, general stopping of clocks, breaking of some window glass; violent shock, overturning of loose objects, falling of plaster, striking of church bells, falling of some chimneys; very violent shock, fall of chimneys, cracks in walls of buildings; destructive shock, partial or total destruction of some buildings; disastrous shock, overturning of rocks, fissures in surface of earth, mountain slides, destruction of dwellings and other buildings.

The personal equation enters so largely into the reporting of earthquakes, as it does into the reporting of other things, that students of earthquakes give the widest latitude to all reports received. In general, however, earthquakes are classified according to the above list.

data concerning the strain creep, tension and elastic rebound of the earth's crust may be derived for use in making forecasts of earthquakes.

Study of the possible movements of the crust of the earth also are being made with instruments set on "fixed" monuments along the San Andreas rift, which is shown as the solid black line on the accompanying map of the San Francisco Peninsula. It was along this line that the crust of the earth weakened and gave way in April, 1906. Since the earth moved in different directions on either side of this rift, this is considered one of the strategic positions for the study of earth creep. Two points—Olema, in Marin County, across the Golden Gate northward from San Francisco, and Crystal Springs Lake, San Mateo County—were chosen for the setting up of the monuments, which consist of four concrete piers, two on each side of the rift, at each of the points named. These piers are 13 inches square at the Olema "point," and 18 inches square at Crystal Springs Lake. They are sunk six feet and grounded on solid rock, while each projects about two feet above the surface of the ground. A bronze plate is bolted to the top of each pier, and each plate carries fixed appliances for the fastening solidly of a Fauth 10-inch altazimuth, while each pier also is equipped with holes for spindles, pointers and other instruments, so that any pier may be used for the azimuth, and the others for the sighting spindles and other equipment. These instruments are under locked steel caps, bolted into the concrete, the keys to which are permanently in the possession of the University of California, so that no one not at work on the observations may tamper with them.

From observations thus far recorded, it has been learned that the speed of the earth waves generated at the rift or fault by the elastic rebound of the earth's crust is approximately three kilometers per second, or one and seven-eighths miles, which figures out about 112.5 miles per minute, roughly the speed of a very fast racing automobile doing its best on a board-tracked racing bowl. While this wave-like motion passing *through* the crust of the earth, is too rapid for the human eye to see clearly, yet these swift waves generate other waves of less speed which are visible, so that the reports made by many observers that they had seen the earth move like the waves of the sea during an earthquake are proved to be literally true, though previously believed to have been largely imaginative. It also has been ascertained that the length, width and depth of fissures in the earth's surface, caused by earthquakes, are not accurate indications of the intensity of the temblor, because the various formations of which the earth's crust is composed react in widely different ways to the force applied by the elastic rebound during an earthquake. The stopping and starting of clocks also is an unreliable witness as to either the duration or the strength of the shock, since some clocks are so delicately adjusted that shocks insensible to man will stop or start them, and others so heavily balanced that even a disastrous shock will not stop them, unless they are overthrown. Dr. Lawson has established that the first indication of an earthquake of which man is sensible is the movement of liquid at rest in a vessel, without movement of the vessel. This phenomenon is almost always noted by careful observers before they themselves become physiologically sensible of the shock. Another interesting discovery is that earthquakes in general cause little or no general change in altitude of the area affected, at least none of sufficient magnitude to be detected with certainty by observers or their instruments.

Large oak tree uprooted and overthrown by the movement of the earth during a quake.

A remarkable example of "earth flow." Here the strain creep had become of too great tension for the soft earth in the valley to sustain, and the whole mass from the steep bank shown in the background, to the foreground shown in the photograph—slipped on down the valley.

The Fort Ross, California, rift, and surrounding rift topography. This photo shows plainly the breaking point, or line, along which the earth's crust gave way.

Announcing these discoveries, the University of California, at Berkeley, has issued a statement, which discusses them in part as follows:

"It is well known that, on the occasion of the April, 1906, earthquake, there was a relative displacement of the earth's surface stratum on the two sides of the San Andreas fault line. This amounted, in the Bolinas region (north of San Francisco and the Golden Gate) to as much as 24 feet, and, at many points, to 17 feet. That this relative displacement included areas lying several miles from the fault line was shown conclusively for several critical observing stations by the work of the United States Coast and Geodetic Survey conducted shortly after the date of the earthquake. Intercomparisons of the results for the positions of these observing stations made at different epochs left no doubt that earth movements on a general scale were intimately connected with the earthquake phenomena of 1868 and 1906. In fact, researches of this nature, made by A. C. Lawson, professor of geology at the University of California, have shown that these earth movements are *antecedents,* as well as consequences, of earthquakes connected with the San Andreas fault. There is reason to believe that suitable instruments located comparatively near the fault-line would be capable of detecting the creeping of the earth's surface stratum from year to year. To how many miles from the fault-line motions of this nature can be studied to advantage is uncertain, but the desirability of securing such observations at critical and advantageous points is very great. Movements of the earth's surface of the nature described apparently can be best detected and measured by such programs of observation as those of the United States Coast and Geodetic Survey, and by suitable observations for the determination of geographic latitudes with extreme accuracy in the critical region. It is likewise well known that the latitudes of all points on the earth's surface are generally undergoing change. The international latitude observatories at Ukiah, in California; in Japan, in Turkestan, in Italy and in Maryland, have shown the nature and values of these latitude variations, though the causes operating are, as yet, only partially known.

"Professor Lawson recently has called attention to the fact that the studies of the latitude variation problem by the astronomer-royal for England, Sir Frank Dyson, reveal, in addition to the short-period variations at Ukiah, a secular trend such that the average annual latitude of that station has been slowly but persistently increasing; that is to say, moving northward, during two full decades. Assuming that Dyson's investigation is free from error, which we have no reason to doubt, we can scarcely question the correctness of Lawson's conclusion.

"R. H. Tucker, astronomer at the Lick Observatory of the University of California, at Mt. Hamilton, has made extremely extensive meridian circle observations at the Lick Observatory, from 1893 up to the present time, which yield as by-products night-by-night values of the latitude of the meridian instrument, which must be regarded as of fair accuracy, though they must not be considered as having the same weight as the results obtained by the international latitude stations. In fact, the accuracies in the two series are of quite a different order, and necessarily and unavoidably so. Nevertheless, Professor Lawson's tabulation of these results led to the suspicion that a change in the latitude of Mount Hamilton of small but appreciable amount had occurred at or about the time of the severe earthquake of August 3, 1903, which was local to the Mt. Hamilton region. Tucker is of the opinion that the apparent variation of latitude does not represent a real fact of nature, for the reason that his observations, made for quite other purposes, do not rest upon homogeneous data, and, therefore, may be of an accidental nature. While it is not maintained that the evidence actually establishes that a variation of latitude occurred in 1903, yet the evidence must be considered as of great weight."

The Poincare-Lloyd George Diplomatic Duel

Some Facts on Why a Breach Threatens Between France and England

By W. P. CROZIER

"M. POINCARE," said a distinguished English writer the other day, "hates the idea of international conferences as much as he hates Lloyd George."

The two ideas must run very much together in M. Poincaré's mind, for to say Lloyd George is almost the same as to say conference. It is impossible to understand the present tension between France and England, which is not far removed from the danger of an open breach, without realizing Mr. George's attachment to the idea of round-table conference, the effects which he has gained and hopes to gain thereby, and the resentment of the French Parliament and politicians who think that they have consistently lost and will lose in their deals with him over the bargain counter.

Mr. George always has excelled in personal negotiations. Ever since he first became a cabinet minister he has aimed at bringing every dispute, domestic or foreign, to the conference table, confident that his powers of negotiation and compromise—of "wangling," as it is colloquially called—will bring him out victoriously. In fairness one must add, how would it be possible ever to settle the most difficult and dangerous questions in which a number of powers are vitally interested except by conference? M. Poincaré does not face that question. But he knows, or thinks he knows, that Mr. George has been too much for M. Briand in personal discussion and has persuaded him to give away what M. Poincaré regards as the interests of France. So M. Poincaré has declared brusquely for the old style of diplomacy, carried on by means of notes and memoranda between the foreign offices, and since he became Premier he has been busy elaborating three separate notes to be delivered in due form and order to the French ambassador at the Court of St. James. And he has announced that whatever happens he personally will not go to the Genoa conference, which Lloyd George regards as being necessary to the economic salvation of Europe. That is a severe snub for the conference idea in general and for Lloyd George in particular.

His Attitude an Obstruction

A MERE question of method, it may be said. But not at all! At least Mr. George will not so regard it. He has for some time been revolving in his mind large schemes for the "reconstruction" of Europe. He hopes for American assistance, but if the United States were to say that Europe must first show her will and power to begin to help herself, then the British Premier would reply that by so much the more is it important for Europe to get ahead with his plans for reconstruction. And for these plans three things at least are necessary:

First of all, conference between the principal powers affected.

Second, the inclusion of Russia and Germany.

Third, a definite change in the policy pursued hitherto by France.

I leave out of account the question of the participation of the United States. The problem and the task are definitely Europe's, which cannot shift the responsibility. It is her duty to grapple with them resolutely regardless of any assistance which she may or may not receive from without.

It is Mr. George's firm belief that only by face-to-face discussion can the interminable difficulties of European reconstruction be overcome. He wants to create the intimate friendly atmosphere of personal intercourse, in which it will not be so easy for the enemies of his policy, the open antagonists or the secret obstructionists, to prevent progress. Much has been written of the bitterness which M. Briand's opponents displayed at the idea of his playing golf with Mr. George at Cannes. But from their own point of view they were quite right. That game of golf was not a mere frivolous interlude. It was all part of the conference atmosphere—a genial, round-table feeling of *bonhomie*—which Mr. George tries to create. M. Poincaré will have none of it. He wants a deliberate exchange of formal diplomatic notes. What use is that to Mr. George? France, no doubt, will have representatives at the Genoa conference. But M. Poincaré's declaration against conferences means much more than a difference of methods. It means obstruction and opposition to the general reconstruction program, of which Mr. George regards conference as the indispensable instrument.

This obstruction threatens the breach between England and France which has long been coming. It touches three main points:

1. The pact of guaranty which the British Premier proposed that England should give to France against wanton attack by Germany.

2. The granting to Germany of somewhat milder terms in respect of reparations payments on the ground that her stability is indispensable to Europe.

3. Readiness to bring Russia back into the ring of nations and to assist her to revive, on the ground that Europe and the East—to go no further—cannot be really healthy until Russia resumes something like her old place in the world.

Mr. George had persuaded M. Briand to accept an English guaranty, which would have run for 10 years and would have pledged military and naval assistance to France if Germany had attacked the actual French frontier. M. Poincaré, it is understood, asks for a period of 20 or 30 years. He means that the real danger is much more likely to arise after the 10 years' period than during it. The British Government would reply that much depends on handling Germany in the spirit recommended by Mr. Hoover's committee (which has suggested that the reparations exacted from Germany should be such as are within her "practical power" to pay), and that if a more lenient policy about reparations is rejected the danger from Germany must eventually be much increased.

What France May Demand

BUT the duration of the treaty is not a principal difficulty. There is a large section of opinion in France which maintains that England should promise to aid France against Germany not only if the French frontiers are attacked but even if Poland were assailed. The British Government would most certainly reject any such suggestion, for British opinion would absolutely refuse to enter into war for Poland. Then M. Poincaré, it is believed, will demand that the guaranty be made reciprocal and that France shall promise on her side to come to England's aid. This is purely superfluous from the British point of view. Why, then, should the French desire it? Partly because they feel it is undignified for them to be "protected" by England, as though they were a mere second-rate power that could not protect itself. Equality is necessary to satisfy their pride. But also they feel that a reciprocal guaranty would mean a formal full-dress defensive alliance that would bind the two countries much more closely together, and for precisely that reason the British Government, which does not desire to be bound and hampered more than it can help, will reject the suggestion.

M. Poincaré also wants a naval and military convention to be attached to the treaty. This would show exactly what help England would render to France, and how and when, at the beginning of the next war. This is logical, but everything depends on what military help M. Poincaré expects. He has intimated not obscurely that France expects not a small army but a big one, to be thrown at once into the field against Germany if a new war comes. Englishmen think a great deal of the little "Expeditionary Force" that went to France in August, 1914, and fought at Mons. But the French think much less of it! M. Poincaré already has written that the British Army to be sent to France at the very beginning of the war should be such as would not merely repel a German invasion if made, but would deter the Germans from making it at all.

He Opposes George's Russian Policy

BUT such an army means conscription in England. Well, there will be no conscription in England. No government dare propose it, no Parliament dare pass it. The British Government's policy nowadays—however much one may criticize some of its actions at and since the peace—is not a big conscript army to fight in a "next war" on the Continent, but a conciliatory, constructive program that will make war, to say the least, unlikely. If M. Poincaré's demands are such as they are thought to be, the most probable result will be the abandonment of the Briand-Lloyd George "pact," with nothing to take its place.

Not less violently is M. Poincaré opposed to Lloyd George's Russian policy. Many persons in England, and still more in the United States, also are opposed to it, but from different reasons to M. Poincaré.

It was agreed at Cannes that the Russians should be allowed to enter the conference of the Powers at Genoa only if they agreed to recognize all the state debts of Russia. The French probably are quite skeptical about anything in actual cash ever resulting from the acceptance of this condition. They must remember that the French Revolution itself repudiated the state debts of France, and certainly no one in this country is very hopeful that we shall live to see France repay her war loans, although, of course, she recognizes the obligation. But M. Poincaré's reluctance to bring Russia back among the nations arises from the fact that she shattered the whole scheme of French diplomacy in Europe. (It was M. Poincaré himself, by the way, who brought the Russo-French alliance before the war to the highest pitch of efficiency.) Russia was the counterpoise to Germany on the East. She was the equivalent of another French Army. Now Russia has gone and France is left alone face to face with Germany. Nay, the situation is worse than that, because the French are obsessed by the fear that at some not very distant day Russia and Germany, being both hostile to France, will combine against her.

Hence France's incessant labors to build up a strong Poland which shall divide Russia and Germany from one another; hence her desire that England should consider an attack on Poland as no less serious than an attack on France herself; hence her encouragement to Poland and Rumania to keep up strong armies on the Russian frontier; hence her recent agreement with the Turkish Nationalist Government, which she desires to wean from its agreement with Moscow, and to direct again into the traditional hostility between Turkey and Russia. Lloyd George wants a general peace with Russia. It would be the first step toward bringing the resources of Russia back into world intercourse, which is now a very definite part of Mr. George's policy.

M. Poincaré would reply that it is no part of his policy. France is indifferent to the return of Russia to world trade, especially since it is certain that the German market must benefit by it. At the finish he would declare that the fundamental condition of French security is that she must have an eastern counterpoise to Germany. Can it be Russia? No: Russia is hostile. Then he will not move a finger to set Russia on her feet. On the contrary, he will keep a row of client states—Poland, Turkey, Rumania—to be thorns in the flesh to Russia and to safeguard the interests of France. The standpoints of the two premiers are poles apart.

Scoffs at British Motives

SO THEY are also in respect of Germany. Mr. George's view might be said to be that the salvation of Europe is more important than the letter of the Treaty of Versailles, which he himself helped to make, and that Europe cannot begin to "function" steadily and well if Germany is driven to financial extremities and her blood constantly drained by reparations payments beyond her power to bear. M. Poincaré is not concerned about German stability or the interdependence of European trade or world trade. France is more or less self-contained. She needs the German market vastly less than—well, than England. She relies absolutely on the reparations payments to save herself from bankruptcy. Without them she has no prospect whatever of balancing her budget. She is bitterly scornful about British motives in desiring to help Germany toward a healthier economic and industrial position. *Le Rire,* the Paris satirical paper, has just published a special number directed against England; there is an English edition thoughtfully provided that the English may not mistake the meaning of it. One of the cartoons shows a sanctimonious Lloyd George, with a Union Jack halo round his head, embracing a sly-looking German and a scoundrelly Russian and saying, "The Lord hath said that ye should love one another for the sake of your souls—*and of our commerce.*" Of course, England is not wholly disinterested in her policy, and the French Nationalists, as in the old days, throw at her the taunt of this "Nation of Shopkeepers!"

England may be able to persuade France to moderation by canceling the French war debt to England if France will remit part of the German debt to herself. But the efficacy of such an offer is doubtful. France sees the actual German cash in prospect, but there is no suggestion that as yet she sees any way of repaying what she owes to England. The offer, therefore, to remit a debt which in any event she may not discharge for an indefinite period would be of very little value. But if M. Poincaré will abate nothing of the French demands and England and Italy will not march with him all the way, what then? M. Poincaré has said that France will march alone. Invasion of the Ruhr means the greater collapse of Central Europe, the continuance of French armaments, alienation from England and presumably the maintenance of a French submarine program, which is—let there be no mistake—most seriously regarded. These are the issues that lie at the back of the antagonism between M. Poincaré and Mr. George.

Germany, Under Crushing Burdens, Keeps Going

Economists Unable to Solve Mystery of Nation's Ability to Function

By RUTLEDGE RUTHERFORD
AN AMERICAN RESIDENT IN GERMANY

IN SPITE of the "selling out" plague and the enormous losses resulting; in spite of the reparations payments, the sanctions, the trade barriers and the chaotic exchange, Germany continues to wabble along somehow and even shows signs of industrial strength. The future looks gloomy, it is true; imports have dwindled alarmingly, and it is difficult to see how, with the demonetized currency, new supplies of raw materials are to be obtained. Feverish activity prevails in some lines of business, while others have been visited with stagnation and threatened ruin. The disastrous speculation in foreign bills has been resumed. Two big banks recently failed, and many factories have had to lay off their employes because of the shortage of coal and raw materials. Few will dare hazard a guess as to the future, especially after the failure of the Cannes conference materially to lighten the reparations burdens. Withal, many industries, as textiles, for instance, are still going at high pressure. Textile firms have in many instances increased their working hours. Most of them are still on full seven days a week. Some employ double shifts.

The how and the why of it is not easily explained. Predictions of the world's most famous economists have been set at naught. Italian and Swedish financial publications declare it utterly inexplicable how Germany keeps up at all under present conditions. By many she is being held up as "the mystery nation." The Manchester *Commercial* says:

"Great surprise is expressed at Germany's continuing to operate extensively in the face of the greatly depreciated value of the mark. The position seems beyond the power of the average Englishman to understand."

Indeed, it is beyond the power of the average American or other average person to understand. It is not alone "the depreciated value of the mark" that Germany must "operate in the face of." This is but one effect of the underlying causes which entail the burdens she must carry. The handicaps under which Germany labors must be realized to obtain anything like a clear understanding of her industrial status. Her present plight is condign punishment for her sins, no doubt. But if the victim writhes in agony under the torture, becomes flighty on occasions and seems to lose her mental balance, as at present, the world should not be surprised. Greek mythology knew of no more terrible punishment than that of the Denaiads who had to pour water continually into a barrel which had a large hole in the bottom. The same sort of punishment appears to have been meted out to Germany. Her people are laboring hard. American visitors declare that Germany is the only European nation that has returned to work. But the work is of little avail. Nearly all the awards go for reparations. There's a hole in the bottom of the barrel.

Has But Few Natural Resources

FIRST, let it borne in mind that even before the Versailles conference fixed the price Germany must pay, she was not so large as Texas, but with nearly 70,000,000 mouths to feed and backs to clothe. Her soil was infertile, for the most part. Her principal crops were potatoes and beets. About the only other natural resources were coal and iron. Of these, before the war, there was an abundance. But the people could not eat nor wear coal and iron, and where would they obtain materials for clothing? Germany produces no cotton at all, only about six per cent of her wool requirements and 20 per cent of her flax consumption. Before the war, as now, Germany was dependent for her very existence on the free intercourse between nations. Then, as now, her main concern was cotton and wool. That is by far the most threatening aspect of the present situation in Germany—the growing shortage of cotton and wool and the inability to import with the depreciated currency. Some spinners and weavers yet have large stocks they accumulated when the mark was higher, but what they will do when these stocks are exhausted is a problem not easy to solve.

Before the war Germany well realized her dependence in this respect and was putting forth desperate efforts to remedy the weakness through the medium of her colonies, especially in respect to cotton production. Down in East Africa, in the land of Tanganyika, German experts discovered a wonderful soil for cotton. Seeds of Egyptian cotton were introduced into the Rufiji delta and the result was a long staple growth, equal to that of the finest product of the Nile. The crop was increasing by leaps and bounds. In 1902 a scientific school was founded at Mpanganya to give the natives thorough instruction in cotton cultivation. The results were magical. In 1910 there were 17 cotton estates on the Rufiji, with 2,000 hectares (5,000 acres) devoted entirely to cotton and 24 other estates growing cotton on an extensive scale. In 1913, the year before the war, the German plantation cotton on the Rufiji had increased to 13,000 hectares (37,500 acres). In 1902, Tanganyika exported less than half a ton of cotton. In 1910 the exportation had increased to 623 tons; in 1912 to 1,882 tons, and in 1914 the crop was estimated at 3,000 tons. What the actual figures for 1914 might have been cannot be stated, but in 1917 the British seized 13,000,000 pounds of cotton in the Rufiji district alone.

On Germany's home soil—in Silesia, Posen and West Prussia—great progress was being made in wool growing. Silesia, possessing the largest landed estates, the largest herds of sheep were found there, but Posen and West Prussia were not far behind. Before the war there were about 6,000,000 sheep in Germany from which was obtained nearly 8,000,000 kilos (16,000,000 pounds) of wool.

Loss of Colonies a Severe Blow

THEN came the war and the Peace of Versailles. The result is that Germany has been deprived of all her colonies, totaling 1,000,000 square miles, and including all her promising cotton fields. The whole of German East Africa, comprising 385,000 square miles, has been divided between England and Belgium. England takes 365,000 square miles, with 4,000,000 inhabitants, and Belgium 20,000 square miles, with 3,500,000 inhabitants—11 persons to the square mile under British control and 175 under Belgian, the latter being the most densely populated area on the African continent. All the fine new cotton-producing country goes to England. To realize its possibilities, it should be borne in mind that the enterprise is only in its infancy there and that the Tanganyika territory alone is more than 10 times the size of South Carolina, which produces roughly 1,000,000 bales of cotton a year.

Of Germany's own territory, all the best wool-producing section of Silesia has been taken away, as has the whole of Posen and West Prussia, where such progress in wool growing was being made.

Thus, in so far as the textile industry is concerned, Germany has been almost completely denuded of raw materials, and apparently deprived of means of acquiring them, for the depreciated mark forms such a barrier that it is almost impossible to import raw materials from abroad through the medium of Germany's own currency. Other means must be found. Yet we learn that the German textile industry is still going at high pressure. Here seems to be a real mystery, just as these journalists declare.

The mystery deepens when we take other facts into consideration. The largest cotton manufacturing district of Germany, in the Rhine region, has been occupied by the French, and many believe it is to be permanently retained. The textile industry there is now suffering great depression. Under the Peace Treaty, Germany loses the whole of Alsace-Lorraine, with 37,000 looms and 1,800,000 spindles. "Since the loss of the Saar region and the major part of Upper Silesia," says Dr. Julius Luebeck, "German consumers and producers are more than ever in need of untaxed imports."

Huge Surrender of Goods

BUT the Versailles Peace did much more than strip Germany of all her colonies and her most productive territory, and this must be borne in mind to clearly understand Germany's present position. It took away her mercantile fleet, so that she was compelled to haul her raw products in foreign bottoms and pay the high prices in foreign currency. It took away her river and canal craft. It deprived Germany of nearly everything, so to speak, and so she had to begin all over again. Five thousand of her best locomotives were taken away, as were also 250,000 passenger and freight cars, leaving Germany with a lot of rickety rolling stock, which for a long time completely paralyzed railway traffic. All the Diesel engines which were such a valuable aid to German commerce, have had to be either given over or destroyed. She has had to deliver up 5,000 motor trucks. Other items include 14,000 airplanes delivered to the Entente and 13,476 destroyed; 27,695 airplane engines delivered and 23,476 destroyed; 58,000,000 active detonators delivered and equal number destroyed. All guns and munitions have been delivered or destroyed. Armies of men are now engaged at Germany's expense blowing up forts and battleships, destroying armaments and former armaments, wrecking munition factories, and every kind of enterprise which bears a suspicion of service for war purposes. The great *Deutsche Werke* was converted to peace pursuits and, under allied permission, was transforming gun cotton into film cotton. But it, too, according to latest reports, is to be destroyed, entailing a new loss to the German republic of 9,000,000,000 marks (normally $2,160,000,000). The *Deutsche Werke* formerly employed 260,000 hands.

Enormous quantities of chemicals and dyes, textiles and textile machinery have had to be delivered in reparations payments. There has been an enormous confiscation of German patents, as sanctioned by the Versailles Peace. In America alone 4,500 chemical and dye patents, of priceless value, were taken from Germany and sold to the American Chemical Foundation. Horses, milk cows, dredges needed for keeping rivers and harbors clear, dry docks, agricultural machinery, spindles, looms and all manner of articles of commerce have had to be given over. Much German labor is largely engaged in rebuilding the damaged districts of France and Belgium and replacing French and Belgian machinery with new and modern German machinery. Germany has been compelled to reconstruct the French looms and spindles with entirely new parts, according to the newest German designs.

But all this does not begin to tell the story of Germany's handicaps. It is the cash indemnity that Germany is now struggling to pay that has really caused her to stagger. It is this that caused the depreciation of the currency and has threatened Germany's collapse. This cash indemnity is the most colossal sum ever assessed under any conditions of war or peace in the history of the world. It is so vast as utterly to be beyond the grasp of human imagination. All the world stood aghast at the reparations demands of 4,000,000,000 marks which Germany levied on France in 1871. That was truly terrific, but it was a mere bagatelle compared to the 132,000,000,000 gold marks ($31,680,000,000) now demanded of Germany. This is more gold than has been produced in the world from the time of Solomon's temple down to the present day. Translated into American silver dollars, it would form a bridge 130 dollars wide across the Atlantic Ocean. But the demands do not stop at this.

Staggering Money Figures

THE London schedule of payments, which assists Germany to the extent of prescribing the installments in which Germany shall meet her obligations, further provides that Belgium's war debts shall be considered apart and in addition to the 132,000,000,000 gold marks formerly fixed as the total reparations debt. Belgium's claims include 2,200,000,000 gold marks ($528,000,000), which Belgium owes France; $300,000,000 she owes England; $250,000,000 she owes America, and a few other items which Germany is asked to pay. Added to all this is the cost of the army of occupation, which Germany must pay, amounting to 5,000,000,000 gold marks ($1,200,000,000). The Inter-Allied commission in exercising its control over German finances, and so on, is costing the German people 1,240,000,000 gold marks a month. Then there are the claims of individuals against the German Government for additional millions yet untold. While German property in enemy lands was confiscated and became an asset to those lands, Germany must pay for every farthing of damage done to enemy property in Germany, as well as elsewhere in the far-flung area of the World War. That these claims will not be underestimated may be guessed from the fact that the claims for damages done to property in the devastated regions of France and Belgium amount to more than the assessed property value of all the buildings in France and Belgium combined. Reduced to paper marks, the legal tender of Germany, the original reparations demands, aside from the extra claims of Belgium, the claims of private individuals, the cost of the army of occupation, and other extras, amount to 23,200,000,000,000 marks, figures such as only the astronomer heretofore has had to deal with.

Of late a series of demands have been made on Germany for tremendous expenditures. There followed thick and fast the milliard mark gold payment, the Loucheur-Rathenau agreement for the payment in kind of 7,000 milliard marks in three and one-half years, the dismemberment of Upper Silesia and the giving over to Poland of the Silesian Black Country, the richest commercial district for its size in the world, demands for payment of claims to private individuals, duns from banks from which Germany has borrowed to meet reparations demands, and the demand of a payment of a percentage on all ex-

An Envoy From the World's Only Absolute Monarchy

By UTHAI VINCENT WILCOX

(C) Underwood & Underwood

A relative of the only absolute monarch in the world has come to America seeking recognition for his country, Afghanistan. The Ameer has sent Mohammed Vali Khan to Washington that he may keep in closer touch with world conditions since the great war has emphasized the strategic location of his country.

FROM far away Afghanistan there has come an envoy to this western republic. He has come seeking recognition for his little known Moslem kingdom situated over in middle Asia. Having won from Great Britain formal acknowledgment of his country's independence, the Ameer now seeks to gain diplomatic representation in America.

Mohammed Vali Khan is the man chosen to represent Ameer Amanullah Khan, the last and most powerful king of Afghanistan, the hermit among organized peoples and nations. Even forbidden Lhasa is more easily entered than is this unfriendly realm of fanatical tribes. The capital city, which is Kabul, has for centuries maintained a suspicious intolerance of all foreigners. The "keep out—this means you!" sign is figuratively hanging outside and armed men enforce it.

European politics and history have favored this policy until the World War changed the complexion of the surrounding dynasties. Russia and Great Britain—the lion and the bear—for centuries deadly rivals, became allies and the buffer state of Afghanistan was in 1919 accorded formal recognition by Great Britain. England had long paid its ruler a fat annuity.

Now the isolation policy of the Ameer has relaxed ever so little. There is no appreciable difference to the wiley trader, to the white man and the missionary, but the very fact that an envoy is sent thousands of miles to Washington asking formal recognition marks the beginning of the end of the old hermit policy of self sufficiency.

Some few adventurous Europeans, mostly British, but now and then an American, and occasionally a Russian or a German, have obtained permission to sojourn for a few days within the unfriendly country of rocks, deserts, irrigated valleys and towering and uncharted ranges.

But even on these occasions it has been because these men could render certain necessary services much needed in the capital city of Kabul. And while acting as engineer or doctor or in some scientific capacity, these occasional guests have been dogged by spies and watched by men who kept them under constant and never-ending surveillance that amounted almost to imprisonment.

Perhaps the Ameer has realized that his "splendid isolation" has meant the survival of his supreme control over the lives and destinies of his people. He undoubtedly understands, for the Ameer is a well-read and an educated man, that much as he may desire to maintain his unique and absolute rule, the trembling thrones of western Europe have undermined his seemingly impregnable position.

But today no monarch anywhere wields anything like such authority. He acts in a paternal capacity to his people. He personally dictates as to the matter of religion, foreign affairs and commerce. He owns Afghanistan's only newspaper printed within the domain, consequently he controls his subjects' knowledge of the outside world.

Although living apart from the rest of the world, modern ideas have captivated his mind, however much he may desire to prohibit their introduction into the lives of his people. You see, the Ameer owns 58 automobiles for his own exclusive use.

Ameer Amanullah Khan is the last independent ruler of a Moslem state and so exercises great political and religious influence among the faithful Mohammedans. Controlling an area of more than 245,000 square miles, the kingdom occupies a strategic position in Asia. It is probable that for many years to come the Ameer of the forbidden land will be an active participant in the political destinies of middle Asia. Evidently this is better understood at Kabul than by many modern statesmen.

The Ameer finds it profitable and wise to keep in close touch with current affairs through his agents in India, Persia, Soviet Russia and Europe, and now in America.

Lest some of his great authority should slip from his grasp, the King of Afghanistan gives authority only to his relatives and close friends, and even these he watches carefully. And woe betide the relative or his agent who should for one moment act contrary to the supreme ruler's wishes or seek to build up his own political fortunes at the expense of the king.

There are, let it be understood, still certain primitive ways of punishing political prisoners that are little else than refined and life-long torture. There are no humanitarian principles necessary to consider in this primitive land.

From the Persians, the Afghans obtained the idea of maintaining a harem, but even in this little known land it has been found to be an expensive custom, so the present Ameer has but one wife, or perhaps he took a lesson from his predecessor who had 100 wives and was assassinated in his harem.

The women of this hermit kingdom are kept in the most absolute seclusion; more so than any other country in the world. They are not allowed even to study; they are not admitted even to the religious school. It is considered very unwise and unnecessary for women to learn to read and write.

The gateway to Afghanistan lies through the famous Pass of Khyber in India. The British Government has fortified this until it is virtually impregnable. Like a typical medieval kingdom the Pass is open only on certain days of the week, usually Tuesdays and Fridays. At that time the caravans coming from the mountains loaded with wool, skins, dried fruit and vegetables, spices and gums pass on through to India.

Thousands of the Afghans' hardy horses and ponies are driven down to India, where they are eagerly sought for polo mounts and the cavalry.

So with this meager intercourse with the outside world, the people live on in ignorance of wars, commercial rivalries, elections, politics, navies and international disputes. That is, all do but the Ameer and his trusted relatives and associates. In this connection it would be interesting to know what Mohammed Vali Khan would do were he given the opportunity to live in America with its equal suffrage and its free criticism of its public servants. He will undoubtedly have some decided ideas on the subject whether Secretary of State Hughes accords his country official recognition or not.

Raising Apples Where Only Sagebrush Grew

Concluded from page 3

ples are graded and packed in boxes. No apple with a blemish can be packed. Each apple is wrapped in paper. Wenatchee apples are advertised extensively. The Wenatchee District Co-Operative Association, a non-profit, co-operative organization of growers, markets the product of 12,000 acres.

The Wenatchee orchards brought the growers $700 an acre in 1919, and the return from the 1921 crop will be as great or greater. The 1921 crop at Wenatchee totaled 12,096,000 boxes, or 1,209,600,000 apples. That means 12 apples for every man, woman and child in the United States.

Nor is this all. Another project, known as the Greater Wenatchee Irrigation Project, is under consideration. This would place between 40,000 and 50,000 more acres under irrigation. It has the endorsement of the state department of conservation and reclamation, and if consummated will add great quantities to the nation's apple bin.

In 1919, the Wenatchee and the Yakima districts in Washington and the Hood River district in Oregon furnished half the commercial apple crop of the United States. With the opening up of further irrigation projects in different parts of the West, the nation may look more and more to once arid sections of the country for great proportions of its food.

The recent report of the Secretary of the Interior makes an estimate of the increase in land values from the government reclamation work. Secretary Fall points out that $160,000,000 was spent since the act was passed in 1902.

Large areas in the government projects were wellnigh worthless before the irrigation began. Large areas were held at $10 an acre or less. Sales of land in the projects now frequently indicate values of $300 and $400 an acre, and in some cases as much as $1,000 and $1,500 an acre, the report says. On the whole, irrigation has increased the value of land in the government projects $200 an acre, according to Mr. Fall. That means a gain of $350,000,000.

Irrigation has increased the value of lands under the Warren Act by another $100,000,000. In contrast to the government projects proper, the government furnishes only part of the water for lands served under the Warren Act. Lands in the towns and cities in the projects likewise have increased in value by $100,000,000, according to the report. That makes a total increase in land values of $500,000,000 due to governmental reclamation work.

Germany, Under Crushing Burdens, Keeps Going

Concluded from page 9

ports. In addition to the fixed payments of 2,000,000,000 gold marks annually (about $500,000,000), there is the Allied plan for making Germany pay 25 per cent of her exports in reparations. This percentage alone now amounts to 1,125,000,000 gold marks ($270,000,000) annually. Within the next few months the German Government must pay the Amsterdam bankers 300,000,000 gold marks borrowed to help complete the reparations payments. The value of material and stock which Germany has delivered up so far in compliance with indemnity demands amounts to 13,000,000,000 gold marks ($3,220,000,000). The great floating dock at Hamburg, the largest in the world, which was recently employed in dry docking the world's largest vessel, the White Star liner Majestic, is soon to be taken away by England and located in Southampton. A large part of the products of shipyards, mines and factories must be given over to reparations. Series A and B, of the reparation bonds, involve a charge for this year of some 3,000,000,000 gold marks with interest at six per cent. More than 60,000 workmen are employed in the devastated areas of France. Germany must pay the wages of all and furnish the raw materials.

These things have tended to produce a feeling of discouragement among the people. Proud of their new republic, they had gone to work with a determination to make the best of their discomfiture, to pay the reparations demands to the limit of their ability, and to exonerate themselves in the eyes of the world from the derogation with which their former militarist leaders had stigmatized them. But the hardships to which they have been subjected have tended to dishearten them. Silesia, the sanctions, the unrecognized plebiscites in Austria and the Tyrol, in spite of all the self-determination assurances, are among the iron facts that have entered deepest into the soul of the people.

Thus, while Germany continues to show signs of industrial strength, there is no telling how long these signs will continue to be discernible. There is danger of a collapse. There is especial danger of bankruptcy and default in the indemnity payments. The only means Germany has of meeting the indemnity assessments in the excess of exports over imports. Yet trade restrictions are ever piled up against Germany. The conveyance of purchased goods into a country from anywhere except Germany is called "importing." From Germany it is called "dumping," and nearly all the nations have "anti-dumping" laws. So what is Germany going to do?

Many German textile firms entered into arrangements with British and American exporters wherein the raw materials are to be converted into finished products here on a commission basis.

Then, I have discovered that before the exchange crash came, German firms bought up large amounts of foreign currency, especially dollars and pounds sterling. The heaviest of these purchases were made when the mark was around 60 to the dollar. (It is now around 200 to the dollar). At about the same time they were laying in enormous supplies of cotton and wool.

The cotton importations from America for several months preceding the exchange crash, which followed the first reparations payment, reached unprecedented figures. The same is true of wool importations from England. These facts may help to explain the mystery of Germany's continued survival in the face of obstacles. Is it not possible that her dealers saw the handwriting on the wall and made provisions for the wrath to come by laying in stocks of raw materials? But what is Germany going to do if such conditions continue and the accumulated stocks of raw materials become exhausted? Already they are getting very low.

"Paper Money" of Guernsey Better Than Gold

Island's 100-Year Battle on Bank Currency and Usurious Interest

THE population was decreasing—stagnation of business causing the laboring class to emigrate and those in comfortable circumstances were leaving in search of the conveniences and pleasures the island failed to afford.

The circulating medium consisted of badly worn French and English coins. There was no bank in the island.

The government of the island is autonomous. It has a parliament, called the "States," which is elected from the parishes, but its decisions are subject to the privy council of Great Britain, to whom there is also the right of appeal.

The pressing need of a revenue led the states to request the privy council to permit an excise tax to be levied to one shilling per gallon on spirituous liquors. This was granted for a period of five years. The duty was renewed in 1819 for a further period of 10 years and in 1825 for 15 years, or until 1844. One thousand pounds per year of this duty was to be used to liquidate the public debt.

As was usual in provincial towns in the early part of the nineteenth century, a great part of the retail trade of St. Peter was carried on in a public market. This market was held in the vacant space around the church. There was no building provided and the traffickers were subject to all the losses and exposures due to heat, rain and cold.

A committee of the States on April 12, 1815, brought in a recommendation to issue £6,000 ($30,000) in one pound State notes, for the purpose of providing a suitable market for the use of the farmers and townsmen. The States rejected this recommendation. However, later in the same year the finance committee reported money was badly needed for roads. The States authorized the issue of £4,000 ($20,000) in notes, which were to be redeemed out of the liquor tax at various fixed dates during the following three years.

How They Built the Market

IT WILL thus be seen that while the issue of notes was first urged on behalf of the market, and they thus became known as Market House Notes, the real security for their redemption was the duty on liquor.

These notes bore no interest, but circulated among the people and greatly stimulated trade and commerce. The last of them were due April 15, 1818, and the success attending their issue and circulation resulted in a new issue of £1,250 ($6,250), on June 18, 1818.

A meat market company which had purchased a site and some buildings for £5,000 ($25,000) had been given the privilege of charging a certain price per head for all animals killed, upon condition that it would sell the site to the States at any future time at the price originally paid. The States took advantage of the purchase clause on April 10, 1817, borrowing the £5,000 at 4½ per cent interest, a report of the committee to issue £1 notes with which to make the purchase being rejected by a majority of one vote.

The advocates of a larger and better market still persevered and were finally successful on May 12, 1820. five years and one month after the first request was denied.

The States provided for an issue of £5,500 ($27,000) in States notes for the erecting of the building, the notes to be redeemed from the rents received for the stalls, to which the States were to add £300 ($1,500) a year from the duty on spirituous liquors, for a period of 10 years.

The building was completed and opened Saturday, October 12, 1822, with a general jubilation. The cost of the building was about $21,000.

It was computed at the inception that the market stalls would bring a net annual rental of £150, to which the States would add £300, making a total of £450, or $2,250, and the notes could all be redeemed and cancelled in 10 years, but the result far exceeded their anticipation.

The "treasurer's account of the market" for the year 1827, as published, shows a net revenue from the stalls for that year as £608, or more than four times the anticipated revenues.

Currency Based on Schools and Health

HAD the Guernseymen stopped here, the success achieved would have been sufficiently illuminating to guide other communities in the way of financing public enterprises without recourse to interest-bearing bonds. But they did not stop. In 1820 they issued £4,000 ($20,000) in one pound notes and paid off the floating debt. A year later an issue of £580 was used to purchase a house occupying a site needed for the new market. Later in the same year £4,500 ($22,500) was issued to redeem an outstanding interest-bearing public debt.

In 1824 £5,000 ($25,000) in one pound notes were issued to repay the 4½ per cent loan made in 1817 with which to purchase the land upon which the market house was built.

In 1826 about £10,000 ($50,000) in notes were issued, some of it for the neighboring Isle of Sark, the balance for Elizabeth College, schools and other purposes.

In 1827 £11,000 in one pound notes were authorized to be used in widening and improving Rue de la Fountaine, a street adjoining the market. This involved the destruction of old buildings and their replacement by new ones and the rents were pledged to redeem the notes.

This was followed during 1828 and 1829 with

Reprinted by permission from "The Evolution of Banking," R. H. Howe, author; Charles H. Kerr & Co., publishers, Chicago, Ill.

further issues, among which was one appropriation of £8,500 for the benefit of Elizabeth College and £11,000 for street improvements.

A threatened epidemic of cholera in 1834 caused an appropriation of £1,000 to be voted to defray the costs of preventive measures. This was issued in one pound notes.

Here we have the history covering a period of 20 years, during which time approximately £80,000 ($400,000) of non-interest-bearing circulating notes were issued and which had no metallic basis, but the redemption of which was secured by rents from stalls, buildings and the excise tax. The worn and mutilated notes were replaced by new ones. They circulated without question and were the source of great benefit and convenience to all classes.

While the total issued was £80,000, there never was at any time more than £55,000 in circulation. While new issues were provided for new purposes, old issues were being redeemed by the application of surplus revenues that had been pledged to that purpose.

The public benefits derived by the Island of Guernsey through this method of financing can be appreciated by a knowledge of the fact that during the 15 years between 1815 and 1830, not only had there been expended $100,000 on old and new breakwaters, piers, and so on, but there had been two streets in the town widened, paved and sewered, 68 miles of good country roads built, in addition to the market house, which had cost, for land and building, £12,748, or $60,000.

At the time the notes were first issued the currency of the island consisted of a mixed, badly worn coinage —French and English. There was no bank on the island and none was established until the notes had been circulating for over 10 years. Consequently there had been no opposition from privately owned banking corporations.

In 1826 three members of the States, two of them members of the finance committee, objected to the improvements contemplated in the widening of a street unless the consent of the king was first secured. Their resolution to this effect was overwhelmingly defeated.

The next year the Guernsey Banking Company was established with one of the three objectors as vice-president. On the 10th of April, 1829, the above-mentioned objectors with three more complained directly to the British Government. The complaint was referred back to the States for reply. The answer drafted by Daniel de Lisle Brock is well worth reading, even though penned nearly a century ago, and was evidently so convincing that the opposition ceased for a while.

But in 1830 the Commercial Bank was started and claimed equal right with the Old Bank and even with the States to issue notes. Daniel de Lisle Brock summoned the States to consider the matter, evidently with the intention of obtaining an injunction against the issue of notes by the bank. He defended the rights of the States as against private individuals, as the following quotation from his address will show:

Money Issue a Function of Government

"IF THERE is one incontestable principle it is that all matters relating to the current coin of the country have their source in the supreme prerogative, and that no one has the right to arrogate to himself the power of circulating a private coinage on which he imprints for his own profit an arbitrary value. If this is true for metal coin still more so is it for paper money, which in itself has no value whatever."

The second bank should have kept, and still ought to keep, to the legitimate business of banking transactions. It appeared to have for its principal object the issue of paper money. The bank makes no secret of its pretensions: there are, it says, three parties for issuing paper money; this issue cannot rise above $450,000 since the circulation in the country does not allow for more, the States ought to have only one-third of the issue, the two banks the remaining two-thirds. This is a fine way of making the division, and very convenient for the Commercial Bank. It would even have some show of justice if the parties had equal rights, and if the public had no interest in the matter; but the rights are not equal—the bank has none to put forward, that of the States is incontestable: they exercise it for the welfare and advantage of the whole island which they represent. Consequently the public has the greatest interest in preserving for the States the power of issuing paper money without interruption. Let the bank reply to the questions already put; let it say what inducement it can offer the public to drive out of circulation the States notes, the profits on which benefits all, especially the productive classes, and substitute for it bank notes, the profit on which benefits only the individuals of the unproductive classes? Now is the time to ask the proprietors themselves and ascertain whether in starting a bank they ever had the intention of letting it work to the detriment of their country.

"The public treasury is the heart of the State—did they ever wish, do they today wish to strike it with a dagger? The bank should feel that it is not enough to intend not to injure, but that it is necessary to abandon any such step which, even without its wish, would be prejudicial to the interests of the country. It should recognize that as regards the circulation of paper money, the States have for a long time and for the common good, been in possession of the ground which it seems to wish to invade which, however, it cannot occupy without injustice."

The debate was lengthy and animated and was around a proposition as published in the *Comet* of September 22, 1836:

"That in the execution of the numerous ameliorations that have taken place during the last 20 or 30 years, the States having put into circulation about $275,000 in one pound notes, as a financial measure in favor of the public generally, if they are of opinion to defend the rights of the States against those who wish, for the advantage of a few individuals only, to hinder the circulation of the States notes, for the purpose of substituting those of private individuals in lieu thereof; and whether it would not be proper to make an appeal to all the inhabitants, who are the friends of their country, to invite them to afford their assistance in supporting with all their might the notes belonging to the States . . . . If they are of opinion to name a committee that shall be authorized in a special manner to defend the rights and interests of the States, and of the public—to do their utmost by every conciliatory measure in their power, and, above all, to agree to an arrangement that shall screen the States from all interruption in the circulation of their notes, which have been issued for the benefit and advantage of the public, with the design of gradually diminishing the number annually. And in the event of such an arrangement not taking place, to adopt every measure and make every necessary sacrifice for supporting the circulation of the States notes. And, finally, should the case require it, to propose to the States the adoption of those ulterior measures deemed requisite by the committee, for the general interests of the island."

This was carried by a decisive majority.

The victory of the States seemed complete. One would believe that the matter was settled for all time and that the private bank notes would be withdrawn from circulation, leaving the issuance of the circulating medium in the hands of the people—but such proved not to be the case.

The Private Bank Takes a Pound of Flesh

WHAT happened during the interval between the meeting of September 21, 1836, and October 9, 1836, no one can tell. The records are absolutely blank on the subject. All that is known is that on the latter date Daniel de Lisle Brock signed an agreement with the banks to the following effect: $75,000 of the States' one pound notes would be withdrawn from circulation and converted into a bank loan drawing three per cent interest. The States pledged themselves not to have at any time more than $200,000 in circulation, and cease collecting the notes of the banks in cash (Gold and Silver). As a result of this agreement the States withdrew from circulation $75,000 and burdened the people with an annual tax of $2,250, to pay the interest on that amount, and gave over to the private banks the monopoly of the money of the island in excess of $200,000 to be issued for their personal profit and the banks suspended specie payment so far as the redemption of their notes held by the public treasury was concerned.

There are still circulating in the island one pound States notes to the amount of $200,000. These notes have been in circulation more than 90 years at no cost for the interest. Had they been converted into bank loan as was the $75,000 in notes the inhabitants would have paid the bankers more than $550,000 in interest and still owe the original amount of more than $200,000, and the interest will run on and on forever if the people never wake up to the inbecility of issuing an interest-bearing debt to supply themselves with a circulating medium.

As it is, they have paid $2,250 a year for interest since 1836. This has amounted up to the present time to $180,000 on a debt of $75,000 and which debt they still owe the bank.

It would be interesting to know the amount of notes the banks have in circulation at the present time and what profit they have made on them.

The Lesson for the People of This Country

THERE is now, and has been for 50 years, $346,000,000 legal tender notes outstanding in the United States. Had these notes been converted into interest-bearing bonds, as the bankers desired, the people of the United States would have paid as interest about $700,000,000 without receiving a particle of benefit and would still be owing the bondholders the original $346,000,000.

In view of these facts the history and experience of the Guernsey Islanders should be read by every voter in America.

The commerce of this country is no longer carried on by means of gold and silver coins. It is not even carried on by means of currency. The cash transactions only amount to five per cent of the whole. The balance, 95 per cent, is paid in bank checks. These latter total more than two hundred billion dollars each year. All this immense sum is based on bank credits.

It is very evident that whoever can control the bank credits can control all business and thereby are enabled to levy tribute on every transaction.

They can assure success to some by extending credit and drive others out of business by refusing credit. Such a power in the hands of a class would result in an economic monarchy from which the public could not hope to escape.

Congress must enact such legislation as will expand the functions of the treasury and the postal banks and through them issue all money and credit for all public purposes.

The Durham ox, the original type from which has been developed the modern shorthorn. This animal was born in England, March 20, 1796. Weight, 2,400.

Countess Vesta, junior yearling shorthorn heifer, grand champion of the breed at the International Live Stock Show in Chicago in December, 1921. She was sold at auction for $2,400.

A Fair of Fairs—All Prize Winners Here

By H. H. MACK

YOU have seen the blue-ribbon horses and cattle at the state or county fair, and perhaps you have wondered what becomes of them. Do they go back to the inglorious barnyard at the farm, their brief fame faded? No; for the most part they go to still another fair, the greatest horse and cattle fair on the continent, where every entrant is a prize winner. A fair of fairs, it might be called; its official name is, The International Live Stock Show, which is annually held in specially constructed buildings at the Union Stock Yards, Chicago.

This annual gathering of the principal prize-winning herds of the country forms a visual demonstration of the ruling tendencies in scientific animal culture. These are the aristocrats of beef and horseflesh. They are the topnotch of breeding. The entries for the December, 1921, show included 3,432 cattle, 587 horses, 1,208 sheep and 3,620 hogs.

All the classes were filled to overflowing, many of them calling into the ring from 60 to 75 head of young animals so thoroughly well fitted that the men, whose duty it was to make the awards, found that they had a very difficult task.

For several years those who were interested in the production and proper distribution of meat-bearing animals on the American continent, had realized the pressing need of a campaign of education among farmers and live stock growers that would stir up a desire to produce farm animals of more uniform quality and of superior flavor and texture as edible meat. Many of the men who took an active interest in this promotion work were connected in some way with the meat business and were cognizant of the fact that the meat eaters of the country were, every year, demanding a better quality of meat. These men perceived that live stock production, the country over, was not keeping pace with the rapid increase in the population. They foresaw the curtailment of western range operations and realized that the country's meat crop must in the future be produced by the general farmer. An increasing demand for meat made it apparent that the rate of animal production must be increased and the fact that the producing area could not expand called attention to the need of more intensive methods.

One of the leading incentives to a great live stock and grain exposition was the need of a court of last resort for live stock exhibitors, who had made the rounds of state and district fairs; a place where the differences in the types of various animals could be arbitrated by experts, and where breeders could compare notes and decide on a definite policy for the work of the coming year. It was desirable that an arrangement should be made for all prize-winning herds to come together and create an outstanding object lesson in improved live stock breeding.

The general idea of the projectors of the movement was to bring together a large number of the best specimens of meat-producing animals and horses that could be found that the eye and the mind of farmers might be trained in the selection of perfect and useful types of domestic animals. The wide difference, between the market value of the pure-bred animal and the scrub, made it desirable that the farmer be taught the folly of producing inferior animals when the same amount of feed and labor, expended on animals of better quality and breeding, would bring much larger profits.

The first show was held in December, 1900; the management threw open to the public the gates of the first International Live Stock Exposition. More than 6,000 of the finest animals in the United States entered in competition for 2,230 premiums amounting in value to more than $75,000. More than 300,000 visitors, from every state in the Union and from all parts of Canada and many other foreign countries, came to see the exhibits and learn the lessons which they taught.

The wonderful success of the first exposition made it immediately apparent that a large percentage of the farmers were just as interested in seeing the live stock of the country improved as were the wealthy fanciers, who had up to that time well-nigh monopolized the business of producing registered live stock.

As the show progressed, interesting developments were noted, one of them in particular being the occasion of great surprise to the live stock breeders of the eastern half of the country, namely, the rapid advance made by cattle breeders in the range country. The range cattle breeders came to Chicago with their branded cattle and carried away some of the most coveted awards in the show. The thoroughness and excellence of the work which was being done on the range was a great surprise at that time.

During the early history of the exposition astonishing results were achieved in the department devoted to the exhibition of draft horses. Probably never before in the world's history were so many splendid draft animals brought together in one place.

Until the present season, the show of draft horses has not always been as large as during the early years of the exposition. The show of 1921 was particularly notable for the sensational character of its horse exhibits. Time is not far distant when America will become famous for her home-grown draft horses.

According to the government live stock estimates for 1921, there are owned in this country 25,182,000 horses and mules, valued at $2,242,639,000. The number of cattle on the farms of this country is, approximately, 66,191,000, valued at $2,838,565,000. Sheep number 45,067,000, valued at $288,732,000, and the hog population approximates 66,649,000, valued at $865,633,000. It will be seen, then, that the value of all the farm animals in this country is about $6,234,569,000. Investigation shows that only a very small fraction of this tremendous live stock equipment consists of pure-bred animals. It is estimated that there are at present in this country only 120,000 pure-bred horses, 1,981,000 pure-bred cattle, 460,504 pure-bred sheep and 2,049,900 pure-bred hogs. That the men and the promotion agencies that are spreading the gospel of improved live stock breeding over the western hemisphere, still have a tremendous work cut out for them seems to be a fact.

Dollars or Rubles?

By WALTER M. WOLFF

Mr. Wolff is an American newspaper man in Germany.

A YOUNG chap from America is on his way to Europe and finds he has but a single $5 bill left in his pocket as his steamer nears the French coast. But he knows beforehand that for every dollar he will get in exchange, in the respective countries, something like the following:

13 French francs
200 German marks
6,500 Austrian kronen
45,000 Russian rubles

We will say that our friend is wise enough to know that his $5 would last not more than 30 minutes in France; so he does not get off the boat in Cherbourg, but proceeds to Hamburg, where his "five-spot" is worth just *one thousand* marks. After making an exchange, he finds his pockets now well-stocked with paper, and he feels again like somebody in the world. But the desire to be very rich like other persons seizes him; and he decides that there is no use staying in Germany when he can go to Austria and emerge from a bank with at least *thirty thousand* kronen between his fingers. Rich? Well, it does throw shadows on that old $15-a-week job back home. But he isn't through just yet. He plays a trump card. On to Moscow! Now he realizes the great opportunity. Furthermore, he finds that he need no longer bother with his Austrian paper. A big hungry-looking Russian can scarcely wait to lay hands on it—and he is willing—yes, more than willing—to pay *two hundred thousand* rubles for it! But this is too much of a good thing. Our American traveler is at a loss to know whether he needs a wheelbarrow or an express wagon to cart it all away. What on earth will he do with it all? What can he do with it?

Imagine yourself in a country where you see only paper money of all denominations, from the little pfennig and heller slips to the thousand-mark and thirty-million-ruble notes—but just *paper*, and cheap paper at that.

It is interesting to know what a person can buy in Germany today for *one* mark; in Austria for *one* krone; or in Russia for *one* ruble. If our American visitor, we will say, were to set out with an "Eine Mark" note in Germany, he could still spend it, of course, but would get blessed little in exchange for it. In 1914 he could buy as much (and more) for a silver mark as he could for a quarter or even a half dollar at home. Today he can still buy a newspaper or a gum drop for a paper mark. For a pair of shoes he must give 300 to 700 marks; and for an ordinary cotton shirt he must spend 150 of them. For a fair suit of clothes he must spend not less than 2,500 marks. But suppose our friend desired to sojourn in Vienna for a day or two. A little illustrated magazine, similar to the four-page supplement that comes with some Sunday papers, costs him 35 kronen. He eats breakfast and the waiter tenders him a carefully itemized statement for 375 kronen (the poor fellow only had a cup of coffee, two rolls and a side order of horse meat). There is no use going into a clothing store in Austria; if you enter without at least 40,000 kronen, nobody will bother waiting on you.

But in Russia a visitor finds his thousands worse than worthless! Only an insane man will talk of sums less than 500 rubles, and this amount will purchase but a small, very coarse loaf of bread. Not so many years ago the Russia of the Czars issued little coins not much larger than shoe buttons in the value of one-fourth kopecs. In those halcyon days of Russian greatness 100 kopecs were equivalent to one ruble, just as 100 pennies are worth $1.

A few days ago I received a letter from Petrograd postmarked with 2,000-ruble stamps! The contents of that letter reveal such pitiful conditions existing today in the former proud city of the Czars, that we, as prosperous Americans can scarcely comprehend the utter hopelessness in the following figures: A single sheet of writing paper with envelope costs 300 rubles; the cost of registering the letter from Petrograd came to 2,300 rubles. A pair of woman's shoes cost 1,000,000 rubles; a cheap pair of stockings cost 50,000 rubles;

A few samples of food prices follow:

Sugar=50,000 rubles a pound.
Butter=60,000 to 65,000 rubles.
Meat=20,000 rubles.
Soap=30,000 rubles.
Potatoes=1,000 rubles.

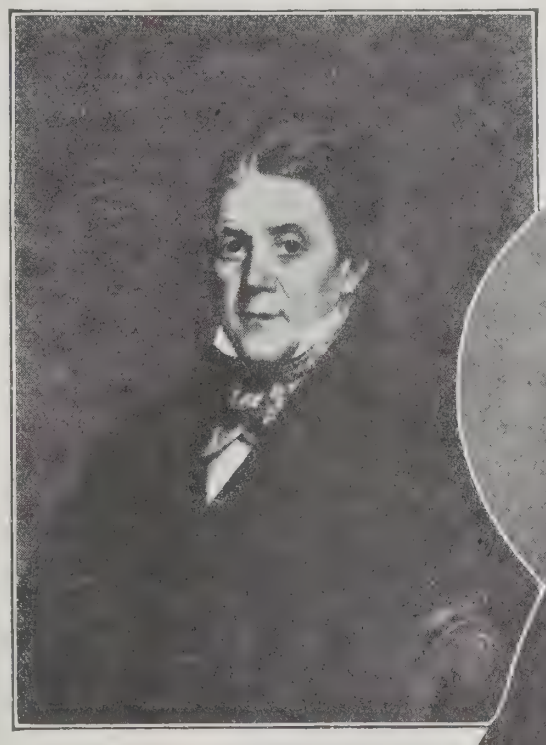
The Soviet is, without doubt, facing a most appalling high-price crisis. The Soviet Government has been forced to print new notes of credit in denominations of from one to 30,000,000 rubles. The capital stock in the Soviet Government Bank has been increased to 2,000,000,000,000 rubles. Russia is all but bankrupt.

Russia has gradually slid back to the conditions of 1914, with only two classes. Today, under the Soviet régime, there are those who cannot pay 500 rubles for a loaf of bread, and almost as many who can pay 3,000,000 rubles if necessary. The profiteers, swindlers and speculators triumph and revel in wealth and luxury.

A Distinguished Harding of Another Day

From Humble Beginning, He Won International Fame as an Artist

PRESIDENT HARDING is not the first man of that name to win fame in America. The other famous Harding was born in 1792, just 73 years before the birth of the present chief executive, and seven years before the death of George Washington. He died in 1866, when Warren G. Harding was a youngster of 12 months.



His name was Chester Harding. He was a self-taught artist whose ability was so distinguished as to win the plaudits both of this country and Europe.

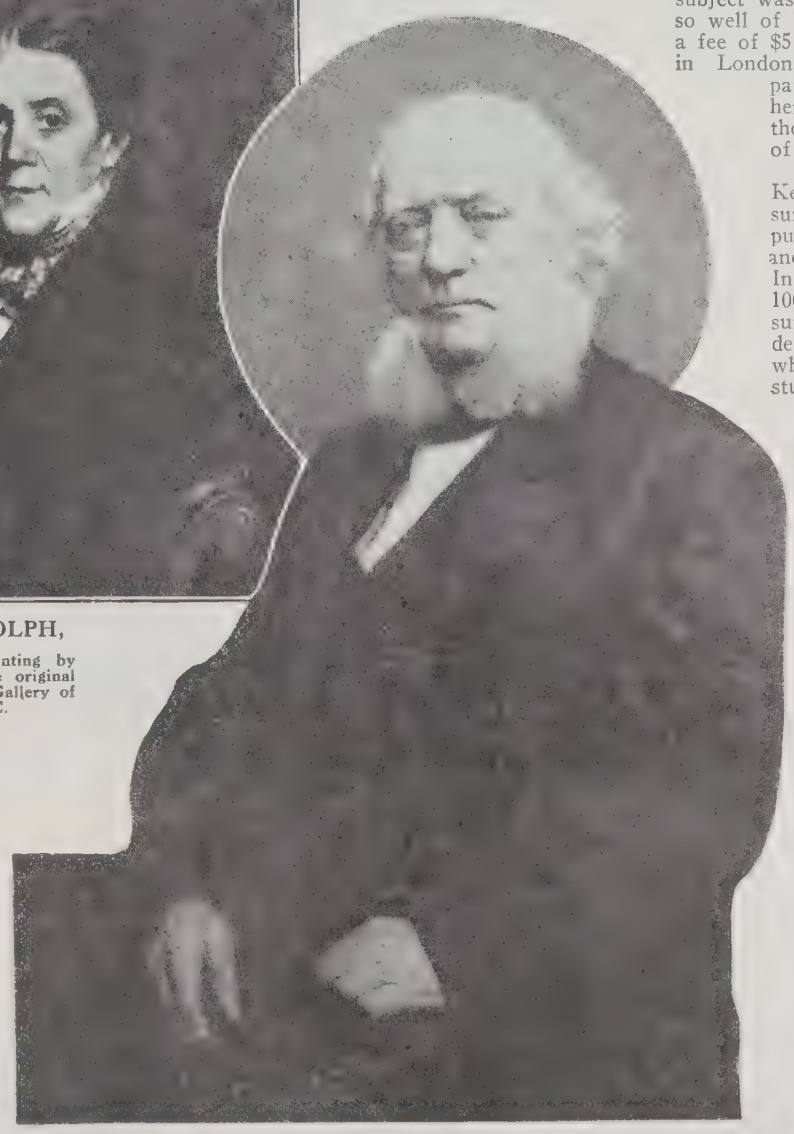
One of the most popular and highly valued paintings in the National Capitol at Washington was produced by Harding. It is the portrait of Charles Carroll, of Carrollton, who, among many other honors, had the distinction of being the last surviving signer of the Declaration of Independence. This famous portrait hangs on the east side of the gallery of the House of Representatives. Two other notable portraits by Harding also may be seen in Washington. That of Henry Clay is in the historic courthouse of the national capital, while one of John Randolph, the famed and eccentric Senator and Congressman from Virginia, occupies a prominent place in the Corcoran Gallery of Art.

The boys and girls of the present generation who imagine it impossible to win worth-while success in life without college education ought to delve into the history of this eminent artist and gentleman, and learn something of his early struggles and privations. It might inspire them with more self reliance and the importance of everlasting hustling and hard work.

Harding was an indefatigable worker. As a result of his energy, his paintings are scattered all over this country, England and Scotland. Foolish temperamentalism, false dignity and artistic starvation were not in his make-up. If there was no work available where he happened to be, he would pack up his kit and hasten to some place where it could be obtained. He never whined about conditions, but got busy.

His physique was such as to attract attention wherever he went. He stood six foot three, and possessed the muscles of a lumberjack. His feet were so large that special lasts had to be made by the cobblers of his day; no ready-made gloves were large enough to fit his hands, and when it became necessary to wear glasses, it was found that his eyes were so far apart that an ordinary pair would reach only halfway across. In the days of his youth he was the champion cordwood cutter of his community, chopping, splitting and piling four cords in a day. He never knew one musical note from another, nevertheless he was a splendid pianist, clarinetist, singer and whistler. His pet hobby was landscape gardening and tree planting.

JOHN RANDOLPH,



Of Roanoke, from a painting by Chester Harding. The original hangs in the Corcoran Gallery of Art, at Washington, D. C.

Harding, born at Conway, Massachusetts, was of the hardy New England type. His parents were exceedingly poor. His father was an inveterate inventor who never seemed to invent anything worth while, which, of course, meant a lean larder and few clothes with many patches. Between the ages of eight and ten, young Chester lived with an aunt, attending a flock of geese for his board and keep. At 12 he was hired out at $6 a month to a Mr. Graves, at Hatfield, Massachusetts. He attended school the two winters he was with this man, learning enough to enable him slowly to read the Bible. The big turning point in his life occurred at 14, when his father moved the family to Madison County, in Western New York, then a wilderness. The father, Chester and two older brothers, armed with axes—those wonderful civilizers—commenced chopping down big trees, built a one-room log house, and cleared a patch of ground on which, between the stumps, they planted corn and potatoes. During the first winter in this new home every member of the family was down with chills and fever. The only reading matter in that humble pioneer home was the Bible—not another book, magazine or newspaper. The most excitement they had was the occasional visit of some wandering preacher who would visit that section, when neighbors for miles around would assemble in some large barn or grove and earnestly listen to the preacher's message.

The winter before the beginning of the war of 1812, Harding assisted his brother in getting out material for making chairs for the countryside. His fighting spirit was aroused by the invasion of the British and he enlisted as a drummer boy. In mid-winter his company started on a three-days' march to Sacketts Harbor through deep snow and zero weather. Running short of food, the soldiers helped themselves to farmers' chickens and shoats along the highway. The enemy failed to confront them, but sickness and disease did. Harding was down and almost out for a time. Finally, he recovered sufficiently to start for home—walking, of course. On the journey his face, ears, hands and feet were severely frostbitten. It was only now and then that a meal could be had. Eventually he reached the little log cabin so dear to his boyish heart—home, sweet home.

All the following summer he made drums for the American Army. Can you imagine what those home-made drums looked like? This venture was followed by a strange tour through the country, peddling such articles as peppermint, tansy and wintergreen essences, and selling in communities in Connecticut the right to manufacture a spinning-head invented by a friend. He left home with an old plug of a horse, a homemade wagon, and $6 in cash. Essences were frequently swapped for a meal or a night's lodging. He returned from this expedition with more cash than he started with and about 50 wooden clocks and several watches, taken in exchange for the patent. He was fairly splurging in prosperity.

A beautiful and lasting love affair shortly followed his home-coming. Her name was Caroline Woodruff. The moment Harding saw her he knew no one else would do.

CHESTER HARDING

Before he could get real well acquainted with her, the family moved 50 miles farther into the wilderness. But what's distance to a man in love? Harding simply *had* to see this dark-eyed beauty with the genial personality, and therefore walked the 50 miles across the hills to make a call. He was not a believer in long courtships. Within an hour after his arrival in Caroline's parlor he had asked her to marry him. She suggested waiting a while. He waited two weeks and then once more walked those 50 miles through the woods to the log home of his fair one. Such devotion was not to be denied. This time he was accepted. Three weeks later they were married, but not on the day set by the bride. Harding noticed the snow was melting and took no chances. The day before the wedding was scheduled he drove to the bride's home in a homemade sleigh, with the parson by his side, and told the girl the wedding must take place at once, as there would not be enough snow left by the next day to take a sleighing honeymoon to their new home.

To make more money and pay off some old debts, Harding embarked in the tavern business for a time, but with slight success. Within a year a neighborhood Shylock threatened to throw him into jail for debt, that drastic law being still in force. A man with a beautiful young wife and cooing little baby had no longing to languish in the county bastile. Bidding his wife and wee one goodby, he tramped to the headwaters of the Allegheny River and floated to Pittsburgh on a raft, where he earned some money painting houses. With this money in his pockets he set out for home to get his wife and baby. His course took him over mountains and through forests populated with bears, wolves, deer and other wild things. It was a mighty lonesome trip. He was obliged to enter his old home under cover of darkness, as the Shylock was more determined than ever to put him in jail. After several days in concealment, the little family left for Pittsburgh, which was reached by tramping to the source of the Allegheny and down that stream on a raft with a crude shanty built on it. For a year he made a comfortable living in Pittsburgh by painting signs for merchants. Then occurred an incident that fired his ambition, ultimately resulting in his great success as an artist of international fame. A fellow named Nelson drifted into Pittsburgh one day, announcing himself as a sign, ornamental and portrait painter. Harding, who had never seen a portrait, thought his work wonderful and ordered pictures painted of himself and wife. The work was done in mysterious fashion, the artist not permitting Harding to see him mix his colors or at work.

From that day Harding was determined to become a portrait painter. His sign work suddenly became uninteresting. Using his signboard paints and a planed board, he produced a picture that looked like his wife, greatly pleasing both of them. His next subject was a journeyman baker, who thought so well of his portrait that he cheerfully paid a fee of $5 and sent the picture to his mother in London. With this encouragement, he painted portraits of his landlady and her husband, who were so overjoyed they credited him with a board bill of $25.

Hearing that an artist at Paris, Kentucky, was getting the fabulous sum of $50 for portraits, Harding pulled up stakes and boated his family and effects down the Ohio to that place. In six months he painted more than 100 portraits at $25 each. With this surplus cash he made a trip to Philadelphia to visit the academy to see what great artists had done. Here he studied their work day after day and learned many things. His next scene of activity was St. Louis, Missouri. His first patron was Governor Clarke. For the next 15 months he was busy every day executing portraits of all sorts of persons. Hearing that Daniel Boone, then 90 years of age, lived only 100 miles distant, he hunted him up and painted his portrait. The old hunter and explorer had never seen a painting in all his 90 years. He was pleased and amazed, but not quite as much so as his favorite granddaughter, who brought all her 18 children to see the wonderful creation.

Purchasing a carriage and team Harding drove to his old home to visit his parents. The old grandfather was still alive and greatly disappointed in the career of his grandson. Taking him to one side, he severely lectured him saying, "Chester, I don't like your way of living. It is the same as swindling to charge $40 for pictures. Why don't you quit this kind of life and settle down on a farm and become a respectable citizen?"

The national capital was decided on as the next place of conquest. Six months were spent there in painting the leading men of Washington, earning enough money for Harding to buy a farm and build a house "back home." Some years later he again spent a busy season in Washington.

Boston was taken by storm after leaving Washington. He painted 80 portraits in six months and had a long waiting list when he thought it high time to visit Europe. He sailed for England in 1823, remaining there for two years, visiting Paris, Ireland and Scotland many times. While in England he painted the Duke of Sussex and many other prominent persons. He became somewhat of a social lion. Every art gallery, artist and art school of prominence was visited in his search for knowledge.

Returning to America, he visited the leading cities, painting better pictures than previously. At Richmond, Virginia, for instance, he painted 18 portraits of the leading men of that commonwealth.

There was scarcely a man of any prominence in America at that time whose portrait was not painted by Harding. He is perhaps the only artist who has had the privilege of painting three Presidents; James Madison, James Monroe and John Quincy Adams posed for him.

Chief Justice John Marshall and every member of the Supreme Court, as well as such men as Daniel Webster and John C. Calhoun, were painted by Harding.

The last public man he painted was General William T. Sherman.

The Little-Known Mother of George Washington

At Fredericksburg, Virginia, the Memory of Mary Washington Is Preserved

By AARON HARDY ULM

"AND up the street a little way is the old home of Mary Washington," said the Fredericksburg man, who was pointing out the numerous places of historic interest in the quaint old Virginia town.

"Mary Washington?" I answered, questioningly.

"George Washington's mother," he explained, as if it was not unusual for strangers to be wholly ignorant, as I was, of Washington's maternal parent.

I, perhaps, had read a paragraph or so about Washington's mother in biographies of her son. But the mother of the greatest of Americans was a total stranger to me. Incidentally, I found later, when I went roaming through the books about her son, that few of the biographers of Washington allow more than a paragraph to his mother. John Marshall, whose monumental work of five volumes still is considered by many to be the best, gives her only a phrase: "...a timid and affectionate mother ...." Some verge even on a sort of scorn in their treatment of her.

Hastening to the small old-fashioned dwelling, now, thanks to a group of patriotic Virginia women, preserved as a public shrine, where Mary Washington spent her latter years and died, I quickly came face to face with the spirit of Washington's mother. In a way, her spirit still dominates the scenes she once ruled with iron will. Nearly all that is remembered of Washington's mother illustrates, among other things, that she always "had a mind of her own." The small house remains very much as it was when she died. The mahogany four-poster bed, with the steps needed for reaching its lofty heights, stands in the main room. It is laden with massive feather mattresses, overlaid by a counterpane. There are other relics of Mary Washington's day, some of which may have belonged to her. The town's growth has caused streets to cut away the ample yard which once fronted the house, and only a moiety of the big garden in the rear remains. Therein, however, you see a boxwood hedge that was set out by its revered occupant of nearly a century and a half ago. Cut off from the main house, as was the rule in that day, is the kitchen, preserved in its original picturesqueness, with its wide fireplace and the tongs and hooks and long-handled cooking irons used in preparing meals over open fires.

Lafayette went there alone, after the close of the Revolutionary War, to pay his respects to the mother of the chief he adored. Lafayette talked with her in the garden and in the house, and immediately thereafter declared: "I have this day spoken with a truly Roman mother."

That's the impression one who looks into the little that survives about Mary Washington gets now. She evidently did not fit into her period with that nicety that was achieved by her graceful daughter-in-law, Martha Custis Washington. Yet if she lived today she might fit better than would Martha, as she would have excelled in the day of the Caesars or any other. For Mary Washington seems to have been of that rare type that fits with equal success into any period—a woman of the ages, as it were.

However the historians may "damn her with faint praise," and regardless of how popular fancy has passed her by, the people of Fredericksburg, where she spent the greater part of her life, are very fond of Mary Washington. And of all the many historic figures associated with the community's past, they seem to like best to speak of her and to narrate the interesting traditions that have come down, largely mouth to mouth, concerning her.

Only a few blocks from the old home a modest monument stands in honor of Washington's mother. It is near a picturesque rock, which overhangs a tree-covered knoll and overlooks a beautiful meadow. Tradition says that in her latter years she spent much time sitting on that rock, reading and meditating. Near by she was buried and there her body rests today. The site of "Oratory Rock" and the Mary Washington Monument was once within the extensive grounds that surrounded "Kenmore," the home of Betty Washington, only sister of George Washington to reach maturity, after Betty became the bride of Colonel Fielding Lewis, one of the wealthiest men of that section during Revolutionary times. The house where Betty lived still stands. Mary Washington's home adjoined the grounds of Kenmore. Bungalows and cottages now separate the two places, but there yet stands a few of the 13 trees George Washington put out there in honor of the 13 states he mainly was instrumental in creating.

The home in Fredericksburg was purchased for his mother by George Washington just before he became commander-in-chief of the Revolutionary forces. Prior to that she lived on "Ferry farm," across the river from Fredericksburg. It was on that farm that her immortal son spent most of his boyhood. It was there that the cherry tree incident occurred, if it occurred at all, for the Washingtons moved there when George was between three and five years old. While in Fredericksburg I visited the place, still comprising nearly the same acreage owned by the Washingtons. It now is owned and operated as a dairy farm by J. B. Colbert. Virtually all vestiges of the Washington era are gone. A few trees may have belonged to it. There's a small, cypress-roofed shanty, clearly very old, which tradition says was once George Washington's workroom and office.

A reputed portrait of Mary Washington, George Washington's mother. But as with other alleged portraits of her, its authenticity has never been established beyond all doubt. From a print in the Congressional Library.

It was there that Augustine Washington died when the eldest son of his second wife, Mary, was only 11 years old, and it was from there that Washington went to school at Falmouth, a few miles away, and at Fredericksburg, near by.

Though Mary Washington lived to a very old age, dying within a few months after her son became the first President of the United States, there survived only a meager amount of authentic data regarding her.

She was 22, when she became the second wife of Augustine Washington. Her father, Joseph Ball, was of the landed aristocracy of the "Northern Neck" region of tidewater Virginia, a region sometimes called the "Athens of America," because of the large number of famous men who were born there. Excepting that she was the "Widow Johnson" when she married Colonel Ball and married again after Mary's father died, little is known of Washington's maternal grandmother. It is probable that from her, Washington's mother derived and passed on to her son a strain which softened the stiff aristocracy of the Washingtons. Mary almost certainly gave to him that stubborn will, which was among his most telling characteristics.

On marrying, Mary Washington took over the management of her husband's household at Wakefield on the Potomac River, about 60 miles below Washington.

The Wakefield place is now cut off from the customary lines of travel and but for a monument which marks the site of the house wherein George Washington was born, no memento of its history remains visible.

Nearly all that is known of Mary Washington's life and most that is known of her first son's boyhood is associated with Fredericksburg and environs. After the Wakefield house was destroyed by fire, it is believed she induced her husband to move to the Fredericksburg place because of the schooling advantages there afforded for her children, of which there were ultimately six, five of them surviving.

Just as Mary Washington will remain largely an unknown figure and the little that survives will be subject to varying constructions, George Washington's relations with his mother, for the lack of data, will always be a subject, more or less, of mystery. The little of authentic nature which survives does not make one certain that they "got along together" perfectly. There appears to have been throughout their lives a more or less constant conflict of will between them. This may be due to the fact that they were both strong-willed and determined, and in several other respects quite different. There is no question about Washington's having had profound respect for his mother.

It is known that even after he made his residence at Mount Vernon he visited his mother often and gave close attention to her affairs even up to her death, which occurred shortly after he was inaugurated President for the first time. However, from the beginning of the Revolutionary War to its end he never saw her. Yet, following the victory of Yorktown, Washington, with his staff and many French officers, hastened to Fredericksburg, and among the first persons he went to see was his mother. An orderly preceded him and with great formality announced to Mary Washington, the heroine of the day: "Madame, His Excellency will be here within the hour." "His excellency!" she exclaimed. "Tell George I shall be glad to see him." George Washington Parke Custis, grandson of Martha Washington, writing of the meeting between the general and his mother said:

"The lady was alone, her aged hands employed in the works of domestic industry, when the good news was announced; and it was further told that the good victor was waiting at the threshold. She welcomed him with a warm embrace, and by the well-remembered and endearing name of his childhood; inquiring as to his health, she remarked the lines which mighty cares and many trials had made on his manly countenance, spoke much of old times and old friends, but of his glory—not a word."

The tradition that she never showed any enthusiasm for her son's military renown seems so well fixed that it must be based on facts.

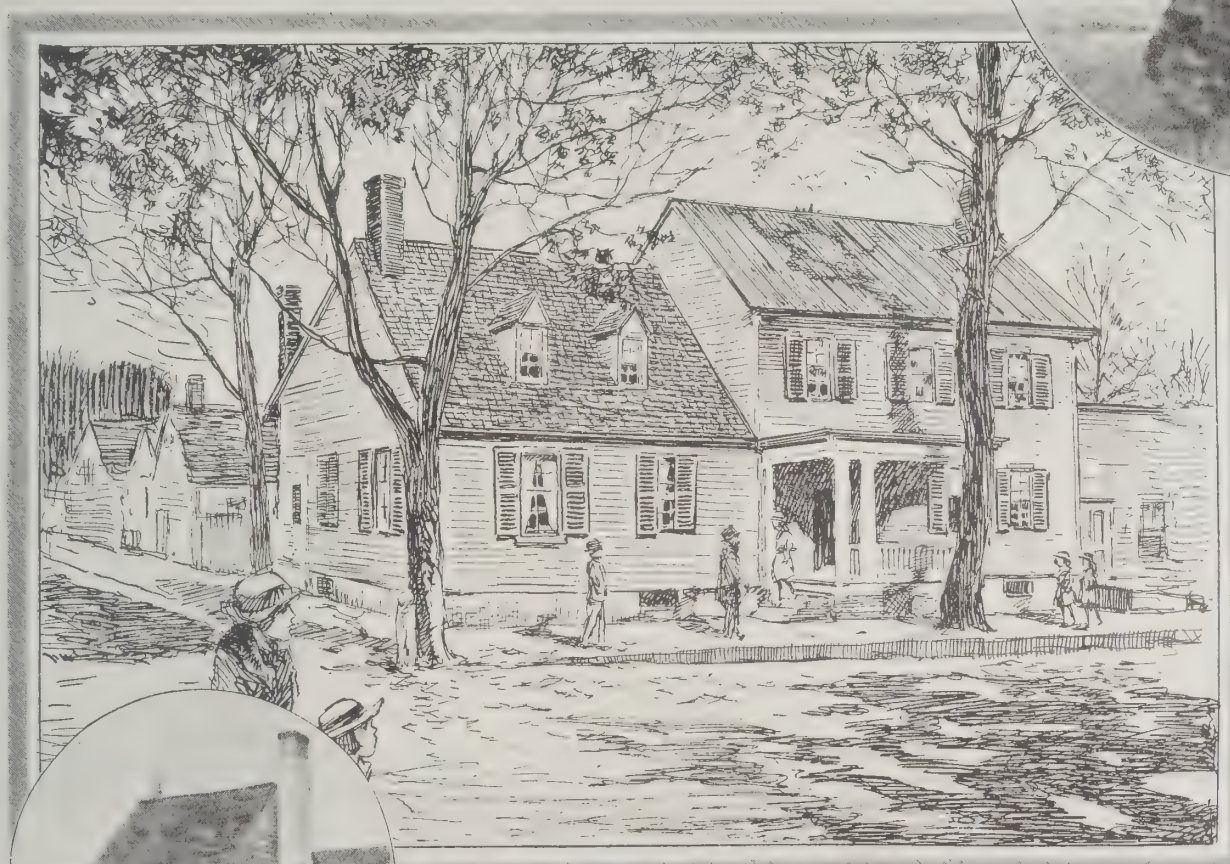
Washington visited his mother for the last time just before he left for Philadelphia to take the oath of office as President. She told him that they would never meet again and a few months later she died.

Lawrence Washington, George's cousin and playmate, in his old age, wrote as follows of Mary:

"Of her I was 10 times more afraid than I ever was of my own parents. She awed me in the midst of her kindness....I have often been present with her sons, proper tall fellows, too, and we were all as mute as mice; and even now, when time has whitened my locks and I am the grandparent of a second generation, I could not behold that remarkable woman without feelings it is difficult to describe. Whoever has seen that awe-inspiring air and manner so characteristic of the Father of His Country will remember the mother as she appeared when the presiding genius of her well-ordered household, commanding and being obeyed."

There are several reputed portraits of her, but not one of them is known beyond all doubt to be hers.

The house where Mary Washington lived was about to be purchased, from its private owner, and carried to the Chicago Exposition and there put on display, when the woman who rented and lived in it brought the matter to the attention of leading Virginia women, who immediately raised funds for its purchase and saved it.



What everyone in Fredericksburg says, as well as the sparse data recorded in books, indicate that Washington's mother was a truly interesting and no doubt great woman.

Where the Mother of an Immortal Son Lived

Scenes From the Home and Surroundings of Mary Washington

Above, left—An etching of Washington's birthplace as it appeared in the early days of the last century.

Above, right—"Meditation Rock," where Washington's mother spent much time reading and meditating during her last years. She was buried near here.

At the left—Where the mother of Washington spent her declining years. The house is preserved as a public shrine in Fredericksburg, Virginia.

In circle—This little structure was erected by Washington and was used as an office and workshop during his surveying days, it is declared.

From prints in the Congressional Library

Left—When George Washington, as a boy, wanted to join the British Navy his mother refused to let him go, and "laid down the law" to him.
Right—Shortly after the battle of Yorktown, he went to his mother's home and presented some of his French allies to her.

URBANA ILL

BRIEFLY TOLD

The sport of falconry is still in existence, and an Englishman catches from 16 to 24 hawks each year in Holland and ships them to the Old Hawking Club at Lyndhurst, England.

The first amber in large quantities discovered on the North American Continent is that recently found in the hundreds of tons of culm from collieries in the Nicola Valley of British Columbia.

The mayor of Mount Vernon, New York, cut his own salary $500 as a starter in his economy campaign by which he expects to save $15,000 in the next two years by salary reductions alone.

Declining to fly either the new black, red and gold merchant flag of Germany or the old German flag, a boat belonging to the Hugo Stinnes interests left Hamburg displaying a small evergreen tree where the flag should have been.

Five thousand seven hundred miles of railroad have been abandoned in the United States in the last five years, while only 3,200 miles have been built in that period.

Twelve specimens of the common wood borer ant of Hawaii, placed in a virtually hermetically sealed glass jar 11 years ago, in the Bishop Museum of Honolulu, have grown to a colony of between 25 and 30, without air or water and on a diet of wood only.

Tests to ascertain temperatures at which work may be done in safety in mines and steel mills are being made by the United States Bureau of Mines. Delicate scales are used in the tests.

Walking through the Canal Zone from ocean to ocean, a distance of approximately 50 miles, in 16 hours and 26 minutes actual walking time, a 12-year-old girl set a new record for women pedestrians in Panama.

One trainman was killed and three others were overcome when their train stalled in a gas-filled tunnel one mile long in Oregon. The three were found unconscious in the cab of the engine and the dead man was found at the rear, where he had fallen overcome by the smoke and gas.

Stars can now be successfully photographed in daylight. From Mount Blanc at 12,000 feet altitude, a French scientist has succeeded in photographing stars up to the seventh magnitude.

Armed guards, both inside and out of armored cars, will soon be transporting millions of dollars' worth of securities in the down-town financial district in New York. The cars will be modeled after the bullet-proof "tanks" now used by the New York post office.

"Jewish Influence on American Life," Volume III in the series on "The International Jew," comprises a third selection of articles on the Jewish Question, and is now off the press. It contains 256 pages, and will be sent for the cost of printing and mailing, which is 25 cents.

"The International Jew," Volume I, and "Jewish Activities in the United States," Volume II, 235 and 256 pages, sent for 25 cents each.

One-twelfth of a second is the minimum time required for the transmission of an order from the mind to the muscles, according to a prominent psychologist before the Academy of Sciences in France.

Acrobatic stunts, involving entering or leaving an airplane while in flight are forbidden under a new clause which has been added to the Canadian air regulations.

The University of Saskatchewan is experimenting with a scheme for domesticating the buffalo. Buffaloes, in the Canadian parks are increasing so rapidly that they will soon be on the market for food.

A University of Alberta professor has perfected an ether preparation, the use of which permits the easy starting of airplane motor engines at 37 degrees below zero.

German scientists have discovered a cure for sleeping sickness, according to a professor of Liverpool University, who related how a man with the disease was cured within a month by the new drug.

The wolves of Russia are starving and are haunting the towns. American Relief Administration workers go armed to protect themselves from the animals.

Because of the high price of oats, horse cabs are being suppressed in Paris at the rate of 20 monthly. It is predicted that soon there will be no quiet drives in the leafy solitudes of the Bois de Boulogne.

By spilling tepid water into it at the rate of two barrels a second, the Rock River in Illinois, a navigable stream, has been kept from freezing for five winters over 13 miles of its length, according to a prominent engineer.

The Mexican Government will soon deed to the men who served under Francisco Villa, former revolutionist, approximately 15 acres of land each, in accordance with an agreement made with Villa on his surrender in July, 1920.

Ripe cherries brought from Rio de Janeiro by swift steamers are selling on the markets of the North Atlantic seaboard.

A monstrous fish, of a species unknown to science, has been caught in the Amite River of Louisiana. The fish is remarkable in that in place of a mouth it takes nourishment through a cauliflower formation under its throat. It has no jaw or opening of any kind in its head, except two small double nostrils high on its head, and a pair of minute eyes. It has a backbone with vertebrae, two small fins and a smooth body.

When an acetylene torch flame burned through the rope which was supporting him, a worker fell 80 feet to his death in Vancouver, British Columbia.

Rubies have been produced in Paris chemical laboratories. They are perfect in appearance and answer every known test.

Argentina is more than five times the size of Germany, and has approximately 8,500,000 inhabitants, according to best estimates.

Placing a tatoo mark on the body of alien criminals so that when one is deported he cannot return to this country under another name is the plan favored by the district attorney of Kings County, New York.

"Marching Through Georgia" is Cambodia's national air. Cambodia is a French protectorate lying west of Indo-China.

The "featherweight pressure" gate, guarding the turnstiles of the Interborough Rapid Transit Company in New York City collects curious and rare coins. Among lead and metal slugs were found 20 centime pieces, flattened pennies, Turkish coins and welfare checks from Sing Sing prison.

A fleet of 100 airplanes for use in Mesopotamia is being built in England. Each plane will carry 10 soldiers and two machine guns, with ammunition, for use in fighting hostile desert tribes, and will cost $10,000 each.

An ore finder, in the form of an electrical device, which will indicate the depth, size and other information regarding concealed copper ore bodies, has been invented, according to a director of the Arizona bureau of mines.

Bryce Canyon and Its Fantastic Grandeur

Wondrous Colors and Weird Shapes Arouse Emotions of Travelers

By WYMAN SMITH
(WITH PHOTOGRAPHS BY THE WRITER)

HERE, Eos dipped her brush to paint the eastern sky of morning; here, she piled high the dainty colors from which to compose the tints and shades of dawn; here, are the happy colors—whites, yellows, pinks, pale reds and grays. As if smitten by them Opwell, the geologist, gazed in admiration, then amazement, and declared, "standing obelisks, prostrate columns, shattered capitals, panels, niches, buttresses, repetition of symmetrical forms, all bring vividly before the mind suggestions of the work of giant hands, a race of genii, once rearing temples of rose, but now chained up in a spell of enchantment while their structures are falling into ruins through centuries of decay."

—Enchantment, perhaps, under the mesmeric spell of their own work; intoxication, from the fantastic shapes and coloring of the portrayal; and wonder, at finding in the rotting, shifting, moving rocks a greater beauty than had appeared in the original perfection.

For Bryce Canyon (Utah) is such a place as one expects to find only in the stupor of a narcotic, and scarcely at the end of a drive through a red canyon, where the pines sway evenly and the larb grows ever green. We had been driving all day through reddened hills, with an occasional lava rock outcrop; and far toward the east we had seen mere glimpses of pink walls, shining brilliantly as if they claimed an internal illumination. Sagebrush and cedars adorned the slopes, and, as we followed the undulations of the Sevier River, willows banked the stream, adding a gay color to the drab of the countryside.

One stops abruptly when he first stands on the rim of Bryce Canyon, gasps inaudibly at the reality, and then, like a pagan worshiper, gazes enraptured at the sweet delicacy of the place. Grandeur one finds in the twisting gorges and in the awe of a great mountain rising upward thousands of feet, but here one is atop the precipice looking down into a foreground filled as with the actors and players in a theater. Painted into the lapis lazuli of the sky are the white cloud patches, a blue haze hovers above the horizon; nearer are the pink cliffs rising from the winding, twisting curves of a stream valley, and far away across the Colorado River, the deep purple mound of Navajo Mountain rises from the level plateau.

Brilliant, scintillating whites, pinks and ochers. Along the rim grows the evergreen larb.

"Why," a low whisper, "that looks like the Navajo Peak, beyond the Colorado River and the Painted Desert—the same as we saw it from Harris Point on the Grand Canyon."

"It is the same," smiled the guide, "and there's a deal of country lying between—more than 80 miles of it."

"Eighty miles?"

"Yes."

Why, it is as if the Chicagoan could see across Lake Michigan and then on into the fruit country beyond. The mind is baffled by that 80 miles of distance, it is unreal—surely it must be only another one of those desert mirages staged in a strange land. Next day after the mists had risen, we looked again, and saw the distant peak appear once more—this time with a cloud bank slowly rolling up around it. Twenty miles, 30 miles, even 40 miles is not uncommon, but 80—even the sagebrusher is astounded when he calculates a moment, for there before his eyes rests an empire of nearly 3,000 square miles.

All this while the play on the stage below has been rushing forward, the light flashes from pillar to statue, it scintillates in a hundred hues, every crevice and nook burning with the multiple reflections, until the radiance is like the splendor of brazen images, glowing under the enchantment of a million candles. Ah—if the ancient Aztecs had builded such an altar, never could the fair god, Quetzalcohuatl, have deserted them; never could he have laid his curse on them if they had erected but a single pair of such gorgeous pillars as are poised row on row within that assemblage. And the Greeks, with all their beauty, might have here learned new lessons in architecture, color and design.

Then in a side slide we espied a ladder—some one had placed it there for climbers who might desire to meander down into the stage, and there make the more intimate acquaintance of the characters. It is a queer world below the ladder, and the trail disappears between two rocky, crumbly walls of white and ocher. The inclosure is dark and damp.

Out in the open is another theater, with the figures perched high on the golden walls like so many humpty dumpties set in ranks; and they, too, are tinted delicately. Shadows are again absent, and the singing light glows everywhere as if it were strains of soft music. Among the minarets and pinnacles grow the green pines, while little patches of wild grape and clumps of larb add vigor to the groundwork. Even as we watch, a storm tops the ridge and drops a shower on the opposite wall scarcely a mile away, yet the crackling lightning and the roaring, reechoing thunder bring the rain no closer to the center of the gorge—leaving us undisturbed to wander along the dry wash, exclaiming as we go about the statues set in nature's hall of fame. Some of them have names, others have not, and after all it is better to let the imagination run rampant among these mysterious shapes; they are all so necessary to the complete beauty; they are all so human and sympathetic, we cannot but like them best when our own individuality designates them as giants, gnomes, dwarfs, goblins, or this or that denizen of the pandemonium.

The faint trail leads around a pine tree, tops a smooth, shale rock ridge, and then leaves no trace until it begins again near the bottom of the embankment. Twice one afternoon, we looked for the resumption of that path, and only after we had gone backward to explore a dozen canyon alleys did we return to find it slipping slyly away toward a natural bridge.

We continued on the trail, across another dry wash, around fallen trees, and up the corridor to where a pale gray bridge hung its lintel between the gap of the bounding walls. Through the portal gleamed the pink of a farther wall, and above it reared the towers of a golden castle. Silence—silence was everywhere.

Away from the archway, the trail pursued the top of a climbing runway, bringing us eventually into the shadow of two huge pillars—for evening was approaching, and the brilliant torchlight of day was settling slowly into a chiaroscuro of exquisite tracery. We had marveled at the iridescence of the morning, but now, it appeared as though a blue light had replaced the earlier one of yellow. Instead of a playhouse, the arena became in the afternoon, a church; and all the shapes sat in straight erect rows of pews waiting for the peal of the organ from the pink acropolis 25 miles away—silent worshipers in the forever of nature. We walked very softly not to disturb those white-gowned thousands in their evening festival.

Pine incense burned that night in honor of the silent drama while the mauve, heliotrope and violet faded into the deeper blue of starlight. Next day we learned that no longer would the supply of adjectives last, that "wonderful," the all-sufficing password of the tourist, was a mockery; but that one could after all obtain a great deal of comfort from such terms as "holy smoke!" and "jumping jack rabbit!". And they come from the inner spirit, not arduously, but spontaneously, to supply the empty void left by ordinary words, for, as we rode through the pines and spruces of the plateau, skirting its edge, we learned that Bryce Canyon is not a solitary beauty spot, but rather a superlative jewel tucked into a cliff wall where the entire mass is one great setting.

En route to a natural bridge 12 miles away we paused to watch the play of light in No Man's Land. Just below us on the opposite slope a chrome roof covered two huge abutments of shelly pink and alabaster. In the portal between them grew a solitary sentinel, guarding the entrance to a doorway revealed to us by a narrow band of light. Beyond the postern hatchments, the undulating hills and valleys rolled away to the east in a great mosaic of light and shade, green and white, until again the dull heap of Navajo Mountain reared into the sky line. Across the enormous pattern the cloud shadows sailed slowly, majestically, one following the other in mute, solemn irregularity—"silence more musical than any song."

"Now, we'll just lead the horses along a little farther and hobble them," spoke our guide. "It's only a short distance on to the bridge and walking is better than riding will be."

Down a white slope we went, leaving the horses behind, dodged through a number of pines, and then again looked on a scene which compelled a slow, tremulous, "holy smoke!"

Yet, except the odor of the pines, there was no incense in the air; on the distant horizon, still marked by the peak of the Navajo, were only a few sparse clouds; but at our feet—there lay the cause of the ejaculation.

Pinks, saffrons, reds, orange-browns, chalk-tints, mingled in the curves of the Arc de Triomphe. Its blazing top surmounted magnificently two huge pilasters set solidly in a nook of the cliff wall, leaving an opening 35 feet wide and 100 feet high, through which we caught glimpses of the valley whose slanting sides lead to No Man's Land and the great bridges of the San Juan country.

The luster of the walls became a shining, scintillating luminosity, with nearer approach and the rays seemed to dance like lightning on the points of the structure. Only the green spindle tops of the pines beyond reduced the intensity, while the sun god showered his glory on the already burning parapets.

"No Man's Land," the guide explained, "is called that because, while it is a good place in summer, the snow piles up there in winter until it becomes impassable."

When the stealthy, triangular shadows of the pines and spruces began their approach toward the bridge castle, we looked for the last time over the immensity of No Man's Land, and then, leading the horses, followed the guide down a westward sloping gully. The elevation decreased rapidly, and in a half hour we arrived at an opening filled with the saffron rays of the afternoon sun.

We rode now across the scented expanses of the sage and followed the edge of a dry wash. Three miles more, the guide informed us, and the trip would be finished. We eventually picked up a little trail which went eastward over the crest of a ridge.

Just as the heliotropes and lavenders faded from the sky dome we reached camp.

Soundly we slept through the night, and awakened with the sprightly jays the next morning. Out on the brink again we stopped to watch the opening act of the play in the theater, saw the mist curtains lift from the eastern landscape, felt again the thrill of the silent actors, and at last coasted softly away toward the gateways of the Red Canyon, leaving behind those age-old statues to preside over the tableau stagery of Bryce Canyon.

Arc de Triomphe, 100 feet high and 30 feet wide, is set in cliff walls of dazzling brilliance and superb color.

A spire of rare beauty in Bryce Canyon.

Odd shapes and forms dominate the heights.

Through the Great Arch into the valley of No Man's Land.

A Great Mosaic of light and shade, green and white.

Two and three hundred feet upward tower the spindling minarets.

This Way Out!

THERE are no rails to split, no slaves to free; what good's a Lincoln now? There's steam heat in the apartments; we don't need a Washington to shiver at Valley Forge. The Indians own oil lands, or have starved to death or something; a Daniel Boone would be as worthless as a ruble. Pullman porters brush you and shine you and gyp you as you cross the continent; those men who drove the prairie schooners and left their bones bleaching under the western sky are not missed at all.

It is time we got sensible about this immigration problem. Every reasoning person will agree that parasites should be eliminated. And what can be more parasitical than a racial stock which the country has outgrown and whose work, even if it was of some account, is done?

New people have come to this country. They expect and assert the right to enjoy themselves. They are ready to take over the good things of the country without charging much, and in a large measure have done so already. The old racial stock is in the way. The newcomers are willing to let bygones be bygones and will hold no grudge for the blazing of the trails, the felling of the forests, the building of the bridges, the tilling of the soil, the fighting of the wars. But the newcomers do and of right ought to feel that the Constitution guarantees to them the more perfect union, unencumbered by old-fogy scions of a pioneer people.

Congress has been fiddling quite a while with immigration laws. The three per cent clause now in effect has a positive benefit as a sort of traffic regulation—it gives each division of the newcomer type of immigrant a year to take its share of the country's wealth before the next batch arrives, thus providing an orderly removal of this wealth from the producing race. You have heard the story, or haven't you? "My Gawd, where do they get all we take away from them?"

But the three per cent law is temporary at best. Congress, which largely represents, and is obedient to, the newcomers, should systematically bundle up all the old pioneer stock and deport them. It might be worth while even to buy the Sahara Desert or some of the coral islands in the South Seas for the purpose. Congress could give the deportees Plymouth Rock and the old Liberty Bell—the cracked one—to take along, when it gives them the air. But give them the air it must. It is intolerable to retain a racial stock which has nothing to do with running the country, has almost no title left in the country and does not know enough to be loudly self-assertive.

The Reign of Law

RESISTING all temptation to superlatives, it is well that there should be wide and deep appreciation of the significance of the recent inauguration of the Permanent Court of International Justice. "The hour of universal justice is striking," said Holland's foreign minister. "In the creation of the highest court of justice the world has ever known, humanity has taken the most remarkable step in its history toward bringing in the reign of law." This is a crystal clear summing up of the matter.

A judicial body has been established which is entirely free from all political control and which is entirely unfettered in its deliberations and decisions by political bodies. In the new international tribunal, men of vision welcome the realization of a great ideal: the substitution of the rule of reason for the rule of force in the adjudication of disputes between nations. The arbitrament of law has long been the very web and woof of the fabric of our civilization, as regards disputes between individuals. Henceforth, it is also to have first place in the settlement of international differences. The passing of the duello between individuals was implicit in the institution of courts of justice. With the actual functioning of international law through an international high court the duello between nations becomes effete.

Law and justice have not always been synonymous, more's the pity! Yet all our written codes and methods of judicial procedure represent more or less successful approaches to the goal of an effective embodiment of the law written from the foundation of the world in man's inner nature. It is not too much to anticipate that the example of the new court with sanctions of authority based not upon the will of any one nation, but upon the co-operative agreement and effort of the 41 nations joined in the league will place the conception of law generally, and the high and sacred responsibility of its administration, on a plane that must illuminate and advance the administration of justice in every court in every land.

Good for Boulder

THERE is a rift in the clouds that so long have seemed to cover Colorado's industrial skies, in the mutual agreement between the owners and union employes of the Black Diamond coal mines in Boulder County, by which operations are kept up, production increased and the public eased of some of the burden in the high cost of fuel.

The men have consented to a voluntary reduction in wages, the operators have reduced the price of coal, and business continues without interference from the labor commission or the armed constabulary of the state. The Boulder County *Farmer,* in relating the incident, concludes by inviting others to profit by the example, which is "of moral and material benefit to the tax and ranger-ridden people of this principality of the C. F. and I. junkerdom."

Consider the Postage Stamp

EDITOR THE DEARBORN INDEPENDENT: The money question is the big question, for upon it hangs right solutions of the taxation and other economic problems. Allow me to offer a suggestion which may prove as clarifying to others as it was to me. Take the postage stamp. It has no intrinsic value. Its value is wholly in the service which the government pledges itself to perform in carrying the letter or parcel it bears. More than once it has served in this and other countries as minor currency when there has been a shortage of small coin. In fact, postage stamps are at this day found very convenient for small remittances by mail. "Intrinsic commodity value" in a currency simply serves as pretext for the exaction of interest by the Shylocks. All money should be regarded simply as medium of exchange and on that account based on units of labor or service and not on gold or silver. Gold or gold-based money cannot really serve as a "measure of value." Services and commodities measure themselves one against the other in the open market. So many hours of minimum value labor against so many hours of maximum value labor, or so many bushels of corn or potatoes. Money may serve as a convenient *register* of such market values, a sort of thermometer of value, so to speak. Let the government issue paper money in payment of public work and supplies, as it issues postage stamps, and there will be no danger of an over-issue as long as any public work remains to be done in this country. It might begin by issuing such money in payment for outstanding issues of government bonds—and then stop issuing bonds.
—George E. Brittain, Dayton, Ohio.

THERE would seem to be something worth thinking about in Mr. Brittain's idea. Postage stamps in the hands of anyone are always worth face value. The same should be true of paper money issued as government bonds are issued (but without time limits as to redemption and bearing no interest), if made legal tender for debts and receivable for all public dues. Such issues would cut out a lot of what the industrial engineers call "lost motion," saving time and labor. To pay for labor and services—it all comes to that in the last analysis—the government now issues interest-bearing bonds to obtain from the banks non-interest bearing paper money with which to pay its creditors and employes, or to refund previous bond issues or pay interest on the debt. The interest charge on these bonds doubles the cost of everything the government buys.

The government is now spending some five billion dollars a year. Let it pay this sum in its own money issued directly by the United States Treasury as called for, just as the Post Office Department issues postage stamps. When the money is paid back to the government for taxes, it might be retired and canceled, or issued again in payment of further services or supplies. There would be no danger of the depreciation of such a currency through over-inflation or its enhancement in value by undue contraction, its volume being limited by a balanced budget. Incidentally, such a currency would prove a curb on extravagance in government expenditures, setting definite limits to collectible revenue.

Happy Little Liechtenstein!

"HAPPY is the country that has no history!" Such a country surely is the principality of Liechtenstein. There has been a wide extension of interest in geography in recent years, thanks to newspaper discussion of the war and the boundary changes ordained by the Peace Conference. It is likely, however, that most of us would have to confess that we had never heard of Liechtenstein, as Lloyd George with such ingenuousness on an historic occasion declared his ignorance of such a place as Teschen.

The interesting thing about Liechtenstein is that an English traveler has discovered that this little country, wedged in between Austria and Switzerland in the Tyrolese Alps, not far south of Lake Constance, has emerged from the welter of the World War without suffering any moral, intellectual or material damage to speak of. The nation covers an area of about one-half that included in the municipal jurisdiction of New York and has a population of about 12,000, or much less than that of an average city ward in the metropolis.

As to the particular reasons for the happiness of the Liechtensteiners, it appears that a few years before the war they came to an arrangement with their nominal ruler, Prince Johann II, whereby the good prince agreed to pay all the expenses of the government on condition that he was allowed to go away and live in peace in Vienna. This compromise freed his loyal subjects from all taxation and they seem to have supported with fortitude and resignation the absence of their liege who did not wish to be bothered with ruling, content like the British constitutional monarch to reign. Possibly, this scheme for achieving lasting popularity was suggested by the course of another contemporary royal sovereign of an independent state, the Prince of Monaco, who pays all the taxes out of the rental he receives from the Casino concession at Monte Carlo.

Prince Johann, who escaped from Vienna to Paris some time ago, can now claim to be the doyen of European royalties, for he began his reign 64 years ago, thus beating by 28 years the next best, that of the King of Spain who was born king. Some day, Liechtenstein may become a republic, following the example of that other miniature mountain state, the thousand-year-old Republic of Andorra.

Not a Specific

IT IS difficult to determine how much actual experience or real knowledge is back of the advice tendered farmers by journals published, ostensibly, at least, in their interest. Perhaps it is best to credit all with better faith than judgment, and let it go at that.

An editorial in an extensively circulated journal blames the farmer's present plight upon his own neglect. The editor ascribes the trouble to too highly specialized farming and to a prevalence of the single-crop idea. "Diversified farming is the cure," he says.

This is the veriest buncombe, since every farm product is in the same boat, and nowhere, except under most favorable conditions, has the farmer been able to obtain the cost of production from his crop. Even where he has made an even break or better, his loss has been in the same proportion, for had prices been higher, such sales would have produced a fine profit.

Diversification is a good thing for the ordinary farm, but only as a protection against a crop loss, not against overproduction. The present depression, however, would have occurred had the editorial farmer specified every kernel of seed planted, unless he also knew and could have prevented the manipulation of the volume of currency in circulation.

Coal Importation

THAT coal from the mines in Wales reaches New York and is disposed of at a figure lower than it can be placed on the seaboard from American mines is probably true, but that the fact means an economic loss is not so certain. Were the import trade and the export trade practically equal in volume, there would be no reason to bring coal across the Atlantic. As it is, the foreign supply is brought as ballast, because it can be sold at mine prices here, saving the cost of unloading the sand ballast that otherwise must be used. Ocean carriers must make one trip here for every trip over, and cannot safely come without cargo. For every ton of ballast brought there is an excess of export over import of a ton of merchandise. In the economic outcome, then, the sale here of ballast coal represents an exchange for American goods. Dealing nationally, there is profit to this country in every ton landed.

Another angle is that no change in labor conditions in our own mines can possibly prevent or reduce this competition to home coal production. The Welsh coal is delivered in New York at a lower price than the difference in mine cost, and could be delivered at a still smaller price if necessary. The consumer has the right to this saving, which, if extended to his own sales, would accrue to the public benefit.

Mr. Ford's Page

POLITICAL parties are like poets, born, not made. And yet political parties have been found to be so useful to certain purposes and interests that numerous attempts have been made to manufacture them for occasion. A political party is a publicity organization, a semi-legislative organization, often a coercive organization which can render more service to special interests than it can sometimes render to the public.

The people, of course, who are living mostly in the nursery atmosphere with regard to these things, imagine that a political party is a fellowship of conviction upon certain principles. That is what it ought to be; and it is the belief that the political party is just that, which keeps it going. But the party is other than that. It would take almost psychic eyes to see just what the so-called political organizations consist in, what holds them together, where their ramifications run, and what type of mind it is that finds congenial the atmosphere of the "organization." Perhaps it is the least moral organization in the world, outside the realm of those which are distinctively subversive.

And yet, such is the irony of things, this lower network of organization forms the basis for much good work. All men who are interested in politics are not on the inside of the "organization," not at all. The real motive power of politics, so far as the motion of the people's mind is concerned, is in the "idea," the "issue," the genuine proposals of government policy and legislative action. But these seldom have their source in the "organization." They are imported from the people. All that the "organization," or the "party" does (the "party" not being the whole number of adherents, but the hierarchy of leaders) is to sort out the possible issues and select the group which they think will "sell" at the election. Any other set of issues—even quite opposite issues—would do just as well if they would "sell." The main object is to keep the "organization" in offices. The party never gets the offices; only the "organization" does that. As a whole, our offices are manned by the prettiest lot of political gamesters that any country ever saw.

So, there we have the genesis of two evils. One evil is the existence of a party which has neither political nor moral principle, but which lives for the thing called "power," using as its steps to power such "issues" as appeal to popular approval; the other evil is the view of certain apostles of moral or political principles that a political organization can be whisked into existence by publicity agent methods, to serve the purpose of a certain candidate or a certain principle for a single election only. So, on the one hand we have the politicians whose object is office, poking around among possible "issues," ignoring the ones which would require moral courage to espouse, and choosing the ones that seem ready to ripen in a campaign; and on the other hand, we have the possessors of progressive ideas looking for a party to "put them across."

It is a situation which speaks indisputably of the sorry collapse which has overtaken political effort in this country.

The "third party" demonstrations have been a sign of the same condition. The only third parties that ever had a reasonable and sincere motive and purpose were never permitted to attain party maturity, because the older parties took their issues and rode to power upon them. An illustration of this may be seen in the adoption of the Prohibition Party's most distinctive plank by both the older parties.

Lately our "third parties" have been launched either for the purpose of putting a candidate across (which must be the final judgment on Mr. Roosevelt's effort) or for the purpose of cementing the radical elements of political disorder and giving them the respectable appearance of political organization. Both were vivid commentaries on the truth that political parties are born, not made. When the genuine Third Party comes, it will not be a Third Party at all, but the First Party, relegating both old parties to secondary status. It will be a national party, summoning New Era Men from all the old parties, and from no party at all, to do the work which others have neglected.

We do not need a "third party" in the United States, we need a party that is first for Americanism, by which we mean the principle that the fulfillment of life consists in the largest liberation of the creative and constructive forces in nature and in humanity for the service and prosperity of all. Americanism is communistic only in that it stands for a community benefit, instead of an exclusive personal benefit, proceeding from all industrial, financial and political activity. The Old Era was individualistic in its objective. The New Era will remain necessarily individualistic in its method, but will enwrap the whole community in its objective. Communism fails just because it is not communism, because it is individualism of a type that defeats the benefits of individuals, and so cheats also the community of its benefits. We are individuals in action and communists in responsibility.

The division between modern parties is not political, nor philosophical, nor moral any longer, but purely sentimental. All of the old subjects of division are now subjects of scientific examination and adjustment. Locally, politics has come to be a preference of individuals for office: one group wishes to place this man, another wishes to place the other man. A sufficient number of experienced electioneers find this kind of politics a sport, to give it zest. But, as for the profound political convictions which marked the birth and the vigorous years of the Democrat and Republican parties, they simply don't exist.

The two great parties are being used—that is, the "organization" of them is being used more and more as bulwarks against the changes which must inevitably overtake the stupidities and injustices which have become fastened in our national life. Every old slogan which warns of the people against progress as something dangerous finds its hearty echo in the political "organization." The "organization" knows nothing about finance, administration, international relations—literally nothing about anything that affects the heart of our national life—but it is always ready with the cries which sustain the old order of things.

That is where the two old parties are in the greatest danger: they have anchored to an era that is even now growing dim in the distance: unless they cut the cable, they will disappear with it.

And it is just here that we mark the fatal distinction between party and people. The people do not comprise the party. Parties are merely bidders for the people's suffrage. When parties disappear the people remain. This is the logic of third parties. The old parties simply die off the limb like leaves that have ceased to nourish themselves with the life of the tree that bore them. The people grow and keep growing. If parties lag behind, as parties now are lagging behind, a new party is inevitable—not to put a chosen candidate across, not to stampede the people for a new "interest," but as an expression of the life of the people. Parties are the people's political clothing; when the coat grows too small it is discarded.

PARTIES at their birth and in their vigor find their whole reason for existence in serving the cause in which they believe. In their old age, parties go searching around for causes or "issues" popular enough to keep them in office. Power is the ambition that rules them then, and not the passion to persuade men to a principle. When division comes between party and principle, party dwindles to the "organization"; the secession of the people has already begun. Then ensues an interim when old parties seek new issues, and old neglected interests seek new parties. But new parties are not made, they are born. The "third party" is impossible; the real "third party" will become the First Party because of the rejection of the others as unfaithful to their trust.

Fossil Men and Fossil Apes and the Scientists

By GEORGE McCREADY PRICE, M. A.

Professor of Geology, Pacific Union College, California.

A FRENCH scientist, Professor M. Boule, has recently published a book dealing with all the fossil human remains hitherto discovered, and this book is reviewed in the well-known English journal, *Nature* (May 12, 1921), by that eminent archeologist, Professor Arthur Keith. The reviewer complains that the author of the book under review shows a very "erratic judgment" in dealing with the celebrated remains found in Java by Dubois, for Professor Boule in this book declares that these remains are those of a giant gibbon "moving toward the human stem" in development. As this verdict in assigning these remains to a large gibbon is one that has already been reached by other eminent men, such as Macnamara, Krause, Klaatch and Richard Hertwig, it would seem to be an opinion deserving of at least some respect. But Professor Keith will have none of it. He says: "Verdicts such as these need not be taken so seriously as they are delivered. Even expert geologists, anatomists, and archeologists will have some sense of the humorous situation we have reached in human paleontology."

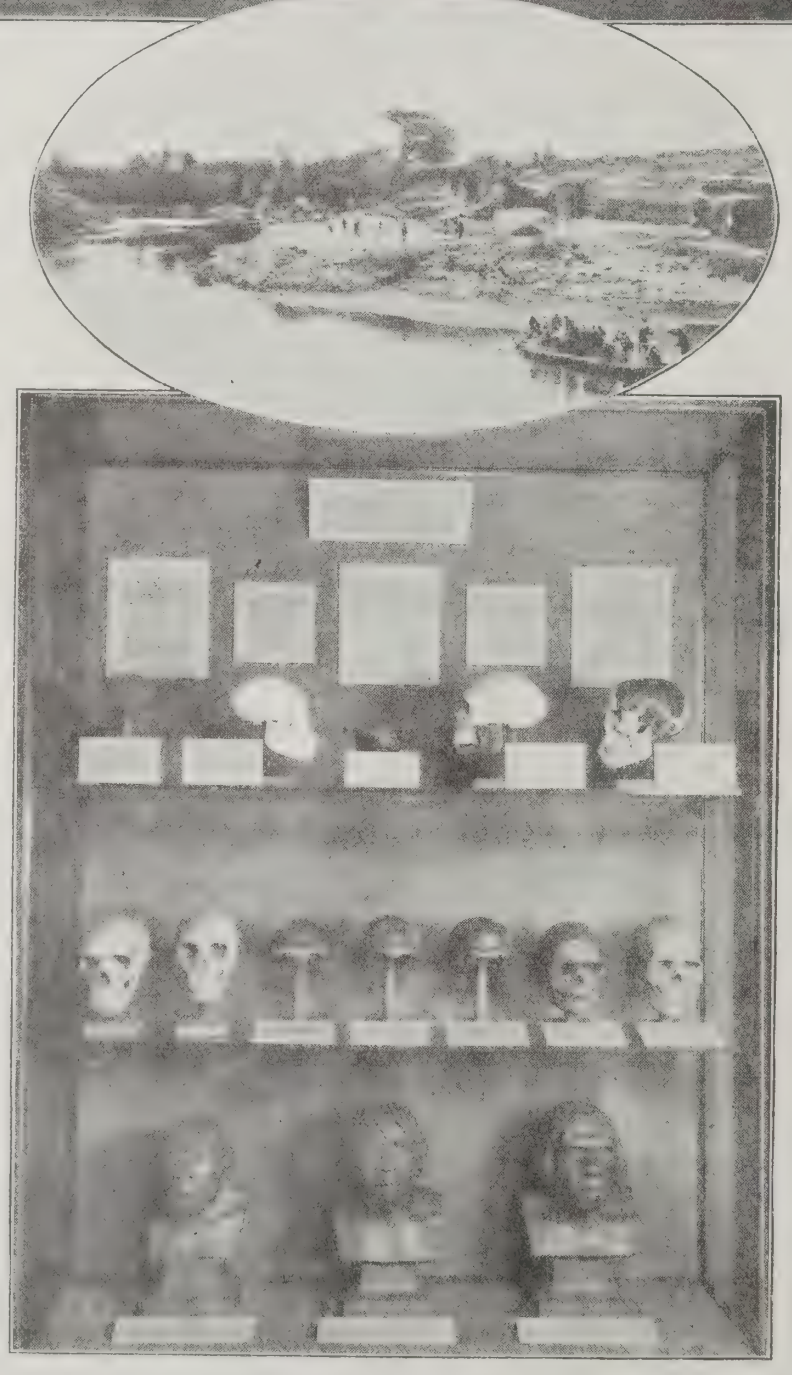
Yes, I fancy they will. That word "humorous" seems a very appropriate word to use regarding the present situation all around, as it concerns human archeology and paleontology. And yet I do not feel sure of the particular aspect of the situation which Dr. Keith has in mind, for there are several which might be so designated.

Let us first glance at the rules by which the antiquity of man is estimated. The following rules are to be seen in a show case containing a set of human skulls in the American Museum of Natural History, New York City. I have here inserted numbers before these rules; otherwise they are reproduced as there exhibited:

"The dating of human skeletal remains is at best only a rough approximation. The probable error of our estimate would undoubtedly be expressed in thousands of years. Nevertheless, we have several guides in determining the probable position in time of a given find.

(1) "The first and best indication is afforded by geological records. Geologists know that the sands, gravel, loam and loess of certain localities were deposited by glaciers, rivers or winds during certain geological periods.

(2) "Another valuable guide is the association of human remains with the skeletal remains of animals now extinct. Paleontologists have a fairly clear idea as to the time at which these animals became extinct.



(3) "A third indicator is the kind of articles of human manufacture found with the skeletons. Archeologists have a general idea of the gradual development of human industries in Europe up through the exclusive use of rough stone implements, to the more finely finished products of polished stone, bone, copper, bronze and iron.

(4) "Finally the nature of the skeletal remains themselves affords an indication of their probable place in man's evolution.

"The attitude of modern science is decidedly critical, and not until a given specimen has been subjected to the above four tests is it finally assigned to a definite place in man's history. Many finds, which have failed to satisfy the demands of science on one or more of the four points of geological position, associated animal remains, associated implements of human manufacture, and morphological form, have been temporarily placed to one side to await the possibility of future discoveries throwing some light on their true position."

The first of these four rules has whatever value attaches to the geological classifications, and particularly to the subdivisions of the Tertiary and Pleistocene strata. This value is not high, as these distinctions are, in my opinion, about 75 per cent more traditional theory, about 20 per cent the tact or intuition of the expert pronouncing on them, and about five per cent real fact. The second rule is not always reliable, as the bones of prehistoric animals, like the Mammoth and the great Bear and the great Lion, in England, were often washed from the surface of the ground into fissures and caves along with the bones of human beings who lived long subsequently to the time when these animals lived there. The third rule is good, so far as it goes; but it is of quite limited application, especially when we are dealing with the very earliest relics of the human race. And the last rule assumes the whole theory about the ape origin of man, and has only such constructive value as may attach to this theory in the minds of the reader. And yet all relics of humanity which do not measure up to these four rules, are "temporarily placed to one side," and are not allowed any place in the early history of mankind. However, we may pass along and study for a while the four most famous specimens of the early human race with which modern science deals.

Top—A show case in the Museum of Natural History, New York City, showing a series of skulls of apes and men. Scattered around throughout the lower part of the case will be seen models of practically all the fossils of apes hitherto discovered, which, as is stated in the text, number about a dozen, many of the so-called species being represented by only a single tooth or a part of a jaw. Center—View of the bank of volcanic tuff, near Trinal, Java, where the bones named *Pithecanthropus erectus* were discovered. Bottom—A show case in the Museum of Natural History, New York City, showing models of the more famous human fossils. The black parts of these skulls represent the parts actually found, the lighter parts have been "reconstructed." In the upper corner, at the reader's right, will be seen the tablet stating the four rules for judging the antiquity of man, as given in the text of the article.

The first specimen is the now famous *Pithecanthropus erectus*. This fossil was found in 1891 by the Dutch army surgeon, Dr. Dubois, on the left bank of a stream near Trinal, in Central Java. Dubois first found an upper molar tooth, then about three feet from this he found the cap or upper part of a skull. The next year he found a left femur, or thigh bone, about 50 feet from the first locality, and also a second molar tooth. Some 16 years later another molar tooth was discovered in the same locality. The place where these discoveries were made had furnished fossils of various animals before this find, and has furnished many more since. It is classified by some geologists as Pliocene, and by others as Pleistocene.

The cap of the skull has been made the foundation for many reconstructions; but it is admittedly difficult to rate the capacity of a skull from such a fragment. However, it is thought to represent a cranial capacity of about 28 ounces, the normal human brain averaging about 49 ounces, and no normal human brain being less than 30 ounces. This Java skull has been variously called that of an idiot, that of a sub-man or ape-man, or that of a large *Hylobates*, or gibbon, the only one of the anthropoid apes which habitually walks erect.

When these remains were first brought to Europe, Virchow, the leading anthropologist and pathologist of his time, pronounced them to be the fossils of a large Hylobates, or gibbon. This opinion is quite generally concurred in by other good authorities, as has already been mentioned in the first paragraph of this article. The other opinion, held by Keith and others, is that these fossils represent a real sub-man, or ape-man; though they do not all agree that this exact type was probably representative of a stage through which the human race has passed, some of them saying that it represents a collateral branch. The value of this specimen, in the minds of the advocates of the ape origin of man, lies in its obvious similarity to the remains of an ape, and also in its alleged great antiquity, though many human relics from Western Europe used to be rated much older than this one is.

Our second ancient human fossil is the jaw found at Mauer, near Heidelberg, Germany. The sand bank in which it was discovered contained some 24 distinct layers, the jaw being found in the lowest one, some 78 feet below the surface. Geologists have pronounced this stratum to be equivalent to the so-called Cromer "forest bed," of Norfolk, England, which is placed in the lower division of the Pleistocene.

The crowns of four of the teeth had been broken off by accident; but those which remain are quite normal in size and in pattern. The jaw itself, however, is so large, or at least its ascending ramus is so massive, as to place it, in the minds of some, in a distinct class by itself. At least this is the argument. There is no distinct chin present on this jaw.

Our third human fossil is the Piltdown skull, found in 1913 at Piltdown, Sussex, England, in a bed of gravel of a high plateau or ancient river terrace. The skull was in fragments, which were scattered over an area of several square yards, and they were not all found at the same time, some having been discovered in the autumn of the year and the remainder not until the following spring. This fossil has been named, "Eoanthropus," or *dawn-man*, and has been pronounced by some to be the oldest human fossil found in Europe; though many others place it after the Heidelberg jaw in point of antiquity.

This Piltdown skull has been reconstructed by many scientists, with varying results; but its cranial capacity is usually rated at about 43 ounces. It is thought to represent a woman; and the average female brain is given as 44 ounces. The brain case is very thick, and the fore part of the face is regarded as somewhat prognathus, or snouty; but the forehead is of a good quality, though somewhat narrow. The jaw which was found along with it is like that of the Heidelberg specimen, in lacking the chin, and in having a very massive ascending ramus or neck.

As for the geological age of the deposit where this skull was found, Keith calls it Pliocene, while Smith Woodward says it is Pleistocene. The one opinion is probably as good as the other.

The fourth in point of antiquity among the human fossils, is the portions of a skeleton, including the top of the skull, which were found in a cave at Neanderthal, near Elberfeld, Germany, in 1857. These remains have been before the world now for so long a time, that they have developed a large literature; and almost

Who Must Pay the Piper in Wall Street?

Speculators and Financiers of New York Siphon People's Savings Out of Banks and Life Insurance Companies for Stock Deals

By CHARLES ALBERT COLLMAN

A STRING of tape ticked merrily out of the glass hood of a stock indicator in a Broad street brokerage office the other day, bearing the following legend:

K T ⅜

This cryptogram announced to the frequenters of Wall Street that the $60,000,000 common stock of the Missouri, Kansas & Texas Railroad had slumped to about the value of a Russian ruble. In other words, for 37½ cents one could buy that day a $100 Katy stock certificate.

At that precise moment, a man on an Iowa farm was painting his barn; a clerk was jotting figures in a ledger in a wholesale house in Chicago, and a school teacher was correcting her pupils' essays in a little red schoolhouse in Massachusetts.

The farmer "never did give a darn what them Wall Street fellows were doing"; the bookkeeper "wouldn't have bought a share of blamed railroad stock with wooden money"; the schoolma'm had never even read a financial column.

To these three folk, the little song of the stock ticker, had they heard it, would have been a matter of supreme indifference.

They would never have been more mistaken in their lives.

For you see, the farmer, with wise precaution, had just insured his house and barn; the young bookkeeper had mailed fifty dollars premium on a life insurance policy; as for the schoolma'am, she had deposited her month's savings in the savings bank.

Now, the real story the ticker tape told was that $8,000,000 in cold, hard cash had just been siphoned out of the vaults of nearly one hundred savings banks, life and fire insurance and trust companies throughout the United States. This was made possible because the bankers who financed the Katy had landed some $13,000,000 of their unsound securities upon institutions that were designed to safeguard the savings of the American public.

Heavy Losses in Investments

IF IT were advisable—which it is not—I could name each of those one hundred savings banks, life and fire insurance companies, the prices they were induced to pay for their Katy securities, and the losses they suffered, which, as said before, aggregate some $8,000,000. I might name a little savings bank up in Maine, which invested $38,000 of its depositors' money in Katy bonds, and lost $27,000 of that sum. Also a fraternal order in New York state, which bought Katy bonds with its members' money, and lost one-half the amount.

A great life insurance company in the metropolis, which placed more than two million dollars of its policyholders' money in Katy securities, suffered a depreciation of close upon one million dollars. A fire insurance concern, whose name is a household word throughout the country, invested the premiums of its policyholders in various Katy issues, among them being the railroad's preferred stock. This investment of $15,000 has slumped today to $300. Indeed, it is worth less than nothing, for the reorganizers of the bankrupt property have assessed the preferred stock $20 a share. So if the insurance company wishes to keep its stock from being wiped out entirely, it will have to put up an additional $4,000 of its policyholders' money.

Fortunately, the losses which these companies sustained were not sufficient to cripple any of them. Federal and state laws have thrown safeguards about our savings banks and insurance concerns, which make them safer, probably, than similar institutions in other countries. But, as will be shown, Wall Street, through a system of its own, lives upon their liquid assets.

It should be to the particular interest of the men and women of this country to know how reckless railroad finance imperils their savings.

They Trusted the Bankers

BOND houses in the financial district sold more than $13,000,000 worth of the securities of the Missouri, Kansas & Texas Railroad to the following institutions:

Six savings banks in Maine and Rhode Island.

Two fraternal orders in New York and Massachusetts.

One mutual benefit association in New York.

Twenty-five life insurance companies in New York, Connecticut, Massachusetts, Maryland, Pennsylvania, New Jersey and Wisconsin.

Thirty fire insurance companies in New York, Connecticut, Pennsylvania, Illinois, Minnesota, Wisconsin, Missouri and New Jersey.

Fifteen surety, casualty and indemnity companies in New York, Pennsylvania, Connecticut, Indiana, Missouri, Illinois and Maryland.

Eighteen trust companies in New Jersey, New York and Rhode Island.

In the above list there is not one institution that failed to sustain a loss in its Katy investment; for the reorganization plan now under way for the bankrupt road provides a radical scaling down in the values of all its numerous securities, from the first mortgage bonds to the short-term notes.

It was a heedless—one hesitates to say a deliberately wrongful act—by which stocks and bonds of this character were planted in depositories of public savings. Officers and directors of these institutions can scarcely be blamed. They are compelled to trust in the probity of the bankers. Whose then was the blame?

A previous article has described how a ring of Wall Street railroad financiers acquired control of the Katy when it was a prosperous road, with a large surplus. Among the managing directors was the partner of a large Jewish banking house, and the head of a great trust company, of which the Jewish banker was a director. The financiers foisted bankrupt properties upon the Katy, dissipated its assets, and rolled up a debt of $2,000,000, contracted in 1909, to the enormous sum of $19,000,000 in 1913. They then deserted the road, which went bankrupt, with a funded debt of $173,000,000. Holders of Katy bonds lost $46,500,000. Seventy-six million dollars in stock was rendered practically worthless. The financiers had profited hugely.

Selling Bonds Beats Safe Cracking

THE high cost of reckless finance is eloquently shown by the fact that the Katy first mortgage bonds, its best security, which were sold by the financiers at $1,012 for a $1,000 face value bond, declined after the bankruptcy to $560, showing a net loss of $452 a bond.

The second mortgage bonds, sold at $887, declined to $345, with a loss of $542.

The M. K. & Eastern Fives, sold at $1,145, dropped to $520, with a loss of $625 per bond.

The Texas & Oklahoma Fives, sold at $1,113, dropped to $370 per bond, with a net loss of $740.

The Katy notes, those of the $19,000,000 issue whose default caused the receivership, were sold at $980 apiece, dropped to $370, and showed a net decline of $610 per note.

One is inclined to marvel at the obsolete methods of the expert cracksman, with his rubber bottle filled with nitroglycerin. How much safer and more profitable it would be for him to open a bond house in Wall Street and sell securities to savings banks.

In the domain of life insurance, the United States is the world's leader. Our great actuarial corporations are so capably and efficiently conducted, that they dominate the field not only in America, but in foreign countries which cannot compete with the inducements they offer. They are magnets that attract the wealth of the world into their treasuries. Their immensity tempts men with the power they spell. The New York Life Insurance Company is the greatest of them all, with total assets of more than one billion. A close second is the Metropolitan Life, also a billionaire corporation, in the so-called "industrial class." It is said of its great building, with its imposing tower, in Madison Square, New York, that it was built with the nickels and dimes of working men and women, and this is probably true.

Insurance Premiums Go to Wall Street

THE assets of *life and fire insurance companies* are made up primarily of payments by policyholders. It is of importance to the bookkeeper to know what is being done with the premiums he sends in for 20 years to pay for his endowment policy; to the farmer, what becomes of the money with which he annually insures his house and barn; to the New England school mistress, how her savings are being invested by the bank. A few concrete examples of how their money is utilized in Wall Street may be enlightening to them.

As a matter of fact, *the available funds of these institutions are the motive power for Wall Street's two greatest activities, financing and stock trading.*

A railroad, needing money, sells $10,000,000 of its bonds to a banking house. The banker buys them for say, $9,750,000, and sells them for $10,000,000 to savings banks, life and fire insurance companies.

The financiers of the Katy, for instance, sold nearly $8,000,000 worth of the road's securities to the following seven life insurance corporations:

Life Insurance Companies	Investments in Katy Bonds
Prudential Insurance Company	$1,905,371
Mutual Life	2,208,690
Metropolitan Life	1,001,933
Equitable Life	400,000
Northwestern Mutual Life	1,353,067
Massachusetts Mutual	850,962
Guardian Life	73,798
Total	$7,793,821

Naturally, institutions of such magnitude as these, whose assets run as a rule from hundreds of millions up to more than a billion, cannot suffer impairment through depreciation in loss of investments such as occurred in the bonds of the Missouri, Kansas & Texas Railroad. But it must be remembered that the Katy is a small road, little more than 3,000 miles in extent. The country's railroad mileage approximates 260,000 miles. A large part of insurance funds are invested in railway securities, whose financing has been woefully mismanaged. The Denver & Rio Grande is a case in point, where security-holders at the present moment are being treated with cruel insincerity.

The financial district justly prides itself upon its wealth and power. But its wealth is not its own. It is money borrowed from the people. The process by which this is done is very simple.

In the foregoing has been given an example how financiers utilize public savings in their financial operations. Now let us see how the brokers operate.

A customer walks into a stock commission house in Broad street, and gives his broker an order to buy 100 shares of stock for him on margin. He deposits $1,000 of his own money with the broker. The broker buys the 100 shares on the floor of the Stock Exchange. But these shares necessitate in their purchase an outlay of $10,000. So the broker adds to his customer's $1,000 another $1,000 of his own money, and borrows the remaining $8,000 from the bank or life insurance concern.

There are days when as many as one or even two million shares are traded in on the New York Stock Exchange. At such times, the brokers, to carry on, obtain from fiscal institutions loans that stagger the imagination. *Wall Street's borrowed eighty per cent is public money.* It is amusing to listen to the talk in customers' rooms in the commission houses. There men favor lower wages, higher interest rates, and argue hotly that the farmers are getting more than they deserve.

As may be supposed, one continuous flood of public savings pours into the vaults of our great life insurance institutions, nearly all of them being mutual concerns, and owned by the policyholders. In order to transact their business, it is necessary for them to keep enormous balances in the big underwriting banks of Wall Street.

Speculators Borrow Savings of Public

FOR instance, in the year 1920, the life insurance companies above mentioned had on deposit in Wall Street banking institutions the sum of nearly $60,000,000. The Equitable Life had more than $9,000,000 deposited with concerns such as the National Bank of Commerce, the Bankers' Trust, First National Bank, Guaranty Trust and Mercantile Trust. The Metropolitan Life had more than $22,000,000 deposited with similar concerns. The New York Life had deposited more than $11,000,000 in underwriting banks. This aggregation of $60,000,000 was the money available to the Stock Exchange broker, in the form of call loans, for his market operations.

But in addition to keeping their policyholders' savings on deposit in Wall Street banks, many New York life insurance companies make, in addition, direct loans in the shape of call money to financiers and Stock Exchange houses. Men of great wealth do not scorn to borrow the public savings in this fashion.

In the year above mentioned, two men, members of the wealthiest families in the country, obtained demand loans for large sums from life insurance companies. One of these is a vice-president of the First National Bank, and officer in many other institutions of similar magnitude. On collateral valued at $1,152,000, he borrowed $1,000,000 from the Equitable Life. The other, a director in the National City Bank and other fiscal institutions, obtained a demand loan from the Equitable for $1,000,000 on collateral valued at $1,168,960. In the same year he also borrowed $2,000,000 from the New York Life on collateral worth $2,254,000.

Financiers of this caliber, who have invested, say, in tax-exempt Liberty bonds, in this wise may obtain the release of their capital, for with their opportunities they can reinvest it in enterprises bringing in much larger returns. Of course, every man has the right to do the best he can for himself, and this merely shows that the passion for riches never dies.

Millions at Stock Gamblers' Disposal

IN THE same year, the New York Life and the Equitable Life made direct loans out of their treasuries of $11,681,000 and $9,861,000 respectively, in the form of call money to active New York Stock Exchange brokerage concerns such as Josephthal & Company; Newborg & Company; A. A. Housman & Company; L. F. Rothschild & Company; William W. Cohen & Company and Newburger, Henderson & Loeb.

Such loans are entirely lawful, but there is something about them that does not seem right. Why cannot this money be used in a beneficial way, toward some productive end, to benefit its real owners, rather than be utilized by speculative cliques in Wall Street?

However, mid-afternoon has come. Our farmer in Iowa is still toiling away beside his barn; the bookkeeper is bending over his work, with the roar and rattle of Chicago in his ears; up in New England, it will be an hour before the schoolma'am can dismiss her class. But on the Stock Exchange the day's work will stop in 10 minutes when the gong sounds the hour of three on the trading floor. As usual, the excitement has grown more active toward the market's close. The brokers are dancing wildly about the trading posts, gesticulating toward one another's faces, their rapid finger movements indicating the "bid and asked." You can hear the roar of their shrieks and yells throughout the length of Broad street. The boys are having a great time. There are more than 20 pools in operation, and they are trying to hoist prices in motion picture stocks, the coppers, the shares of mail order houses—all the popular issues. And why shouldn't they? Unlimited millions of the public savings are theirs for the asking. They've everything to gain, and not so much to lose. They're bound to make a killing in the end.

The "Publicity Man" and Washington News

Including the Story of the "Hand-Out" and What It Means to the Reporters

THE Washington city telephone book lists more than 200 associations, leagues, institutes, and so on, that have offices in the national capital. At least one ostensible purpose of those Washington offices is to influence national legislation or administration in behalf of the groups or the interests which maintain them. All deal in some forms of "propaganda." Nearly all of them make use of that form known as "publicity," which the governmental bureaus and departments also employ to a considerable extent. The "publicity man," in the volume of output if not in number, is taking on an importance rivaling that of the Washington newspaper correspondent. Yet the Washington telephone book does not contain the name of a single individual or establishment that is listed under the classification of "publicity" or "propaganda"! How this comparatively new development has grown and how it operates is told of in the accompanying article.

By AARON HARDY ULM

THE President left his busy office at the White House to attend. The members of the Cabinet were there. The diplomatic corps was represented by a dozen or more foreign ambassadors and ministers. Congressmen and Senators were present in large numbers. Virtually every Washington correspondent was among the invited guests.

The affair took place in the assembly hall of the Pan-American Building in Washington, late one afternoon. In notable participation if not dramatic incidence it has been excelled in recent years only by such occasions as the plenary sessions of the Limitation of Armament Conference.

Newspapers throughout the country gave columns to describing the event and commenting on it editorially. Most of the rotogravure sections of the Sunday papers carried pictures relating to it, and the "news weeklies" of the movies presented its most striking phases in animated form.

Yet it was a "publicity stunt," maneuvered in most part by expert "publicity men" in the service of a great corporation which met the expense. But the cost, though running into the thousands of dollars, was infinitesimal as compared with the value of the "free" advertising received.

The occasion was the public demonstration by the American Telephone & Telegraph Company of the establishment of facilities whereby land, submarine and wireless lines might be used jointly to enable a person at Santa Catalina Island off the coast of California to talk easily with another person in Havana, Cuba.

Propagandists There in Force

UNDOUBTEDLY the achievement was "news." But the skillful staging of its first demonstrations, rather than the achievement itself, is what commanded the "big news" space simultaneously in all the newspapers of the country. The purpose of the promoters primarily was not to bring the achievement to the notice of the public. It was to use the achievement to impress the public with the enterprise, the forethought and public spirit of the corporation which brought it about.

The "stunt" was a legitimate one. There was no deception; real, though in great part artificially made, news was produced; no publication was obligated, or even besought, to publish a line about it.

It is mentioned here only as an illustration—a high-class illustration—of how, despite the disclaimers of editors, the arts of publicity men do affect the news, of how propaganda—though not necessarily harmful or objectionable propaganda—may be so entwined with genuine news that it is often impossible to tell where the real ends and the artificial begins.

If nearly all the news flowing out of Washington, now perhaps the news center of the country and sometimes of the world, isn't saturated with propaganda it certainly isn't the fault of the propagandists. During the last half-dozen years the propagandist population of the national capital has grown tremendously. The Washington telephone book discloses the fact that more than 200 associations, leagues, federations, *et cetera*, have offices there, and each is maintained largely for propaganda purpose. They cover every variety of interest known to the activities and the thought of the country. Most of the big corporations keep resident representatives in Washington and the business of most of those representatives is to handle propaganda in some way for their clients. Even foreign governments have their propaganda bureaus there. Most of the delegations to the recent Armament Conference were accompanied by, or employed after reaching Washington, trained newspaper men to serve them through the medium of the news and other propaganda routes. Most of the governmental departments have their propaganda offices, directed usually by publicity men, though none, as far as the writer knows, is so listed on the rolls.

"Hand-Outs" Flood News Bureaus

WASHINGTON propaganda takes many forms, though news publicity is the one used most conspicuously.

Several months ago I asked the manager of the Associated Press Bureau in Washington to give me an estimate of the amount of press agent "copy" which comes to his desk every day.

"About 20,000 words," he replied. The Associated Press sends out of Washington daily from 10,000 to 15,000 words of news.

"How much of the proffered copy do you use on the average?" he was asked.

"About one-half of one per cent," he replied.

The other news services, which include the United Press, of course, do not afford any easier outlet.

A flood of "hand-outs" pours in daily on the news service bureaus and the correspondents in Washington. The bulk, no doubt, goes into waste baskets. But they must get results somewhere at some time or there would be a let-up in the production which steadily has increased.

The "hand-out" is "canned" news. It is a mimeographed, or duplicated typewritten, or sometimes a printed, sheet, containing information presumably of interest to the newspaper correspondents. The matter usually is written so that the correspondent if he wishes may use it as it comes to him. Frequently it is a real help to the correspondent. Even the press associations cannot maintain the large forces of reporters necessary to cover Washington matters thoroughly at all times. There is no co-operative organization for gathering routine news in Washington, such as the press associations and newspapers maintain in New York and in Chicago. Activity of national import is widely scattered at the national capital. It would require a huge force of reporters for any bureau to keep intimately in touch with all of it.

Hence the "hand-out," which is the product of those who find it worth while to assist the news gatherers. Thus there has developed in Washington what in toto is an immense force whose business it is to get into print "stuff" that bears upon many varieties of interest concerned with public opinion, or with legislation, or administration. It numbers more persons probably than the combined force of news gatherers and writers whose work is paid for by the publications they serve. It is from the ranks of the news gatherers and the legitimate writers that the "publicity" forces in the main are gathered. Even the Associated Press is very much of a training school for "publicity men." Some of the most conspicuous at the capital came from its Washington bureau. Generally the "publicity man" is paid much better than the legitimate reporter or independent writer. The salaries received by some are as large as those enjoyed by even the managing editors of great newspapers. Some operate on a fee basis, having clients as a lawyer does. There are several big private establishments, like that of Thomas R. Shipp, Inc., operated so that a large number of clients can be served at the same time. None style themselves formally as press agents or publicity establishments.

Advent of the Publicity Man

THE "publicity" rage in Washington is the outgrowth of developments that began about 20 years ago. A generation ago "press agents" were employed almost solely by circuses and theatrical organizations. The extension of the "press agent" idea virtually to everything began substantially during one of the big Pennsylvania coal strikes about 18 years ago. The strikers seemed to be getting the best of it in the newspapers. The operators adhered to the old rule of big business that their side of the affair was none of the public's business. Ivy L. Lee, a young newspaper reporter in New York, went to the chief of the operators and procured employment as their press representative. Lee's work in getting the operators' viewpoint to the public through the newspapers was so successful that other big interests began to employ press agents. Lee himself is still regarded as the most successful press agent in America. He has long been the press representative of the Rockefellers. He is now the chief publicity man for the Association of American Railway Executives, which organization, with others built around railroad ownership and management, maintains perhaps the largest propaganda organization in America.

Recently, a member of Congress pointed out to me a collection of propaganda matter relating to the railroads that had come to him during three months. There were more than 200 different documents—handsomely printed pamphlets, neatly printed addresses by men like Otto H. Kahn and by railroad officials like General Atterbury, of the Pennsylvania, reprinted news articles from papers like the New York *Times*, elaborate statistical studies. The railroads jointly maintain in Washington what is known as the Bureau of Railway Economics. Its work consists of making constant studies of facts, such as those gathered by the Interstate Commerce Commission, relating to the railroads. It is a very efficient establishment. A newspaper correspondent writing about the railroads usually can get there any information, no matter how intricate, having to do with the railroads. He also can get the help of a trained newspaper man, drawn from the Associated Press Bureau, in running down the facts he needs.

The war greatly accentuated the importance of the "publicity man" as well as of all factors entering into propaganda. The nations involved in the World War learned quickly that "news" was almost as powerful a war-making weapon as was cannon. The Germans used it from the beginning, particularly with neutral countries. All sides came to use "news" as far as was possible to keep up the morale of populations behind the lines and to impress neutral countries with the justness of their causes.

"The upshot of the whole matter is," Will Irwin, who knew all phases of the war and for a while was one of the directors of our own war propaganda, has written, "that during the war no one, not even a neutral, got the unadulterated truth."

"And while they work with many tools," Irwin wrote at the same time for *Sunset* magazine, "the main object of the propagandists, whether political or industrial, is always the same—to slant, to bias, to color the news. The gentlemen who serve special interests—reactionary or radical—have ceased to skim the surface and have got down to the foundation of public opinion. We may have for a decade, or a generation, an age of lies whereof the honest editor or reporter will be as much the victim as the public."

But the intelligent propagandists do not deal in what patently or of themselves alone are "lies." The art is now pursued on much more refined lines than at the time of Barnum's white elephant fraud and Anna Held's milk baths. "Accuracy" is the efficient publicity man's religion, which, however, does not include completeness.

The excuse given for many "hand-outs" is the insurance of accuracy, and in many cases accuracy is served that way; for reporters work in a hurry and are not always careful about details.

Papers Publish "Canned" News

A PUBLIC man or the leader of a big interest in the public eye when he wants to take the public into his confidence, either by an address publicly delivered or through an interview, usually "prepares" in advance what he proposes to say. He wants to be "quoted correctly" if at all.

Charles Grant Miller, writing in *Editor and Publisher* a few months ago, declared that in his early days of reporting if a reporter, sent out by a city editor to interview, say, a railroad president, returned with a typewritten sheet and no more he probably would have been fired. Acceptance of a typewritten sheet in lieu of spoken words by a newspaper may be likened to the acceptance by a court of the testimony of an important witness carefully written out in a secluded office far from the court room, where no one could cross-examine.

Yet newspapers constantly are accepting and publishing "hand-out" interviews and statements, often without the reporter having seen the maker of them and frequently without making any effort to "go behind" what is given out.

"Canned" news passed out in the form of "hand-outs" often saves the reporter time and energy and usually, if available, represents a saving to the newspaper on the cost of news gathering.

That's one reason why "publicity men" multiply and prosper in despite of the contempt of them so generally expressed by editors.

But the best of propagandists who make use of publicity do not rely very much on the prepared "hand-out," against which a growing prejudice has developed in editorial offices.

They "make" news as in the case recited at the beginning of this story, make it so well and offer it so enticingly that the newspapers cannot refuse it.

Street Railways Try Propaganda Plan, Too

THE ending of the World War, to recite another case, found the street railways of the United States in a uniformly "bad fix." For years their operators had fought for the standardized fare of five cents. Some had gone so far as to contract with municipalities to maintain the "nickel rate" in perpetuity. They had resisted public interference with the management of their properties. With the competition of the jitney and the privately owned automobile, and rising tide of prices for labor and materials, the run of them faced large deficits and had to meet rousing protests from the public about poor service. They found that their best hope for relief was in appealing for justice and sympathy to the public. But how could they do it, adequately and quickly?

It was decided to ask President Wilson to appoint an extra official board of inquiry. One was named and extended "hearings" were held in Washington. The board probably made a "report," but, if so, it was merely for the purpose of "completing the record." For the primary purpose of the move was not to promote a genuine inquiry into the trolley situation —though in many if not all respects the inquiry was genuine—or to evolve solutions for its difficult problems. The primary purpose was to get national publicity on a big scale for the "troubles" of the street railway companies. One of the most efficient press bureaus ever operated in Washington was conducted during the "hearings" by the street railway companies. It was in charge of LaBert St. Clair, a capable newspaper man who had been one of the directors of pub-

(Concluded on page 15)

Getting Poetry Out of a Gloomy Prison Cell

Inmate Says He Wrote Verse to Prove Convicts Have a "Spiritual Side"

By EARL CHRISTMAS

"Stone walls do not a prison make,
Nor iron bars a cage—"

WHILE a prisoner in the Minnesota State Penitentiary, John G. Glynn sought relief from the monotony and gloom of a prison existence by writing poetry. He had not had many advantages in the way of schooling and had never tried to write verse. Nor was his job as a laborer in the prison plant particularly inspirational to the muse. But in his cell at night, he found that he had to have something to do. He couldn't sit there and brood. So, he began writing poems on scraps of paper, tore them up, and wrote others.

Months passed, and, finally, not long ago, Glynn was released from prison. Celebrating his return to society as a free man, he has just published a book of poetry—verses fashioned during these days in prison. The little volume bears the title, "Songs From the Silence," and contains poems which have been accorded high praise by a number of qualified critics.

Though he worked all day as a laborer, Glynn wrote such verses as to draw this exceptional tribute from Dr. Richard Burton, professor of English literature at the University of Minnesota and a noted lecturer on literature:

"Less than two months after the author was set free from the prison at Stillwater, Minnesota, I met him and he put his poems into my hands. Reading them, I had a poignant sense of beauty and pathos; the beauty that is song, the pathos of human fate. I felt like one who finds a flower, dewy and fragrant, beside a dusty road. The wind bloweth where it listeth. There are lyrics in this book, so truly lovely, so unfeignedly simple and sincere, with such an infectious lilt and shine of color, that one's heart melts before them."

Professor Burton not only wrote an introduction to the book of verse, but he sold the books from the platform himself that the message of the prison poet might be given circulation. In only a few weeks, the first edition was sold out. A second edition now is being printed.

Finding himself in prison, Glynn decided early that he wouldn't allow his spirit to be caged. He was determined not to brood over his misfortune. So at every opportunity he turned to the forming of his verses. That became his recreation, a means of expressing himself, and, as he recalls it now, provided a relief that brightened his whole prison life.

Much of Glynn's poetry was written under extreme difficulties. As stated, he had never written any poetry. But he found out what he could about it, and kept everlastingly at it. He spent all his evenings writing. Even when he was at work among the machines of the twine plant, where he was stationed during the days, he was thinking of lines for his poems.

At first, Glynn wrote purely for his own amusement. Then his poems and paragraphs began to appear in the *Prison Mirror*. His column in the *Mirror*, written under the name "Apache," soon attracted wide attention. His offerings were reprinted in other newspapers. Eventually, his poems appeared in the magazines and in some of the anthologies of verse.

When he was released from prison a few months ago, Glynn had two suit cases full of accumulated manuscripts, the aspirations of a poet, and—that was about all. Without a penny in his pocket and with some first-hand knowledge of the way the world regards the released convict, he went to a printer.

"I want to put out a book of verse; will you back me with $5 worth of advertising matter?" he said.

The printer, with more faith in human nature than most men, said he would. Glynn went to the principals of seven Minneapolis schools and explained his plan. He talked to the teachers about the better side of the convict's life—and the orders for his book came in rapidly.

Now, with his first book out, Glynn hopes to publish more poems and other writings, for, be it known, John Francis Glynn has a mission in all this. He wants to acquaint the people on the outside with what he calls "the spiritual side of the convict." He wants to point out some of the defects in the social system that lead men to prison, and he hopes to change somewhat the attitude of the public toward the discharged convict.

"I want to show a side of the convict which that world outside does not see—the spiritual side," Glynn said. "It is important that the outside world see and appreciate this side of the convict. Hundreds of men, who sit nightly, sad eyed, among the ruins of their castles, convicts today, must on some morrow return to society, and society must hold a tomorrow that gives them an honest chance. To do that, society must appreciate the spiritual side of the convict.

"The usual impression on the outside is that all convicts are case-hardened, that they brood in their cells and that they are hardened characters generally. Now, as a matter of fact, they are looking out at the sky. I have tried to express something of this in one of my poems, which runs like this:

THEORY

I heard her say, "I pity those poor convicts in
their lonely cell,
They do not know the woodland rose nor hear
the tales the woodfolk tell;
They do not heed the call to prayer, they
miss each day a love supreme.
God helping me, I will go there and I will carry
them a dream."

FACT

They placed him in a prison cell and put on him
a prison suit.
God gave him dreams, so it befell he rose from
mire that clogs the brute.
They pigeonholed and numbered him, but he
kept faith and held a goal.
And stars and flowers in evening's dim conversed
with his unfettered soul.

"That applies to more men in prison than the outside world imagines," continued Glynn. "You know, there may be a whole lot that is bad in these men in the penitentiary, but at some test, when the occasion comes, the souls of many of them show up white.

"Many men, caught in the grip of untoward circumstances, walk an iron street, peopled with iron hearts, until finally the iron enters their souls. It is only after they fall that they cry out that they could have been saved from a cell by a word of encouragement. The word of encouragement is seldom spoken and a heart grows weary, and will flies the white flag of surrender—then, prison. The world, not comprehending before, is ready still to resign a man to his despair.

"I have made mistakes like a lot of other men, but I have paid dearly for them. If I can prevent some others from making the same mistakes and get the outside world to appreciate the better side of the convict, I will be content. That will make it easier for the men when they get out of prison."

Glynn has dedicated his poems and his energies to "the brotherhood in gray" within prison walls. He has established himself in Minneapolis, and is preparing to send forth other appeals in prose and poetry in behalf of the men in prison.

One of Glynn's poems which attracted attention was "Primrose Time," which runs:

Primrose time in Ireland,
And me in bolts and bars,
Meadows sweet with buds a-break,
And miles of jauntin' cars—
But stay, avick, th' soul of me
Has gone to join th' pageantry,
I'm drinkin' in the music of the lark
beneath th' stars.

Spring time, an' th' shamrocks
So tender green, aroo!
Every colleen in the land
An' gossoon on th' woo—
'Tis priest to shrive me of all sin,
The soul of me gone journeyin'
To see the Irish April skies put on their
robe of blue.

Of a different type was this verse, which was highly praised by Professor Burton:

RUBE ROBIN

Hey, Rube Robin, I'm in love with you.
Last night I heard you singing in the dust
and dew,
And I got to feeling an angel wing had
stirred—
Hey, Rube Robin,
You're
a
Moon-
drunk
Bird!

Hey, Rube Robin, with your trills and slips,
Your lyric's like the kisses from a maid's
red lips;
Your melody is sweeter than a nun at evening prayer—
Hey, Rube Robin,
You're
a
Witch
Out
There!

Hey, Rube Robin, from a paradise,
God sent you to sing splendor into sinners'
eyes.
Go, and God go with you, where dew-wet
roses shine—
Hey, Rube Robin,
You're
a
Pal
of
Mine!

The joy with which Glynn returned each night to his cell is expressed in this poem:

LITTLE CELL O' DREAMS

O little cell of six by ten,
You're as a shrine to me.
I take my place in ranks of men
As the guard turns the key.

The magic of my yesterdays
Through the bars nightly streams—
You waft me to a boyhood white,
O little cell o' dreams.

O little cell where visions rise
And fairies hold full sway.
Bringing new splendor to the eyes
That knew but fear all day.

I think a God must count you part
Of love—you hold its beams.
You are my solace through the night,
O little cell o' dreams.

A verse from Glynn's poem, "Unfettered"

Into his dungeon, cold, and grim,
and dark,
God sent a ray of light, the divine
spark
Of Dreams. And lo, the man again
was whole,
For stars and flowers knew his
unfettered soul.

JOHN FRANCIS GLYNN,

Who, while working in the twine plant at the Minnesota State Prison, wrote poetry that has attracted favorable attention.

Birds-eye view of the plan for the future outlay of Washington. The central composition will be the mall extending from the Capitol to the Washington Monument and from there to the Lincoln Memorial, a distance of very nearly two and one-half miles.

Uncle Sam's Show City

Washington Unique and Magnificent

By GEORGE M. HEALD

WHATEVER loyalty an American may feel for his home town, he regards Washington as also his own. Few are the boys and girls, and older folks, too, who do not have hopes—if indeed they do not have definite plans—to visit their capital city. They expect some day, with their own eyes, to see the great domed building on the hill, where the laws are made and interpreted, and to have a close-up view of the White House at the other end of the avenue, and of the other famed spots which will help to make history real to them. It is safe to say that all who fondly regard America as their country look upon Washington as their representative city.

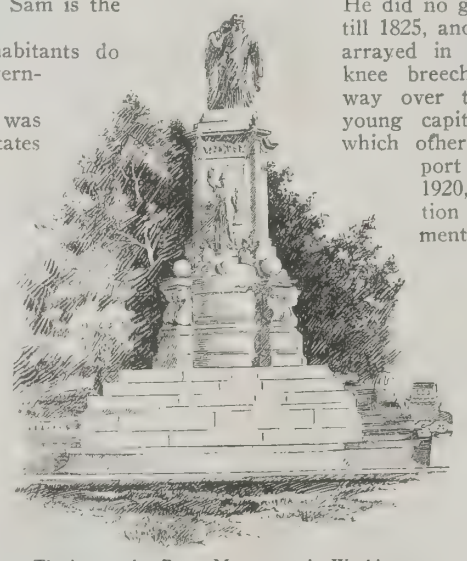
And when the citizens of other countries think of this country, especially in its international relations, they think of Washington. A question often uppermost in the minds of European diplomats is "What will Washington think of this measure?" or "How will this measure be regarded in Washington?" International agreements are made between London (or Paris, or Rome, or Berlin, or Vienna) and Washington.

It is in Washington that the diplomatic notes are prepared, stating Uncle Sam's wishes in international affairs, and it is to Washington that the notes are sent from other countries. Moreover, it was to Washington that delegates from all over the world came to attend the Armament Limitation Conference. Washington—not New York, or Boston, or Philadelphia, or Chicago—stands to the outside world as the synonym—or the symbol—of the United States.

And great statesmen have recognized the representative character of Washington. No man not an American ever understood America better, or loved America more than James Bryce, former ambassador from England, whose book on the American Commonwealth is one of the best and most authoritative works on the American Government. When, in 1913, Mr. Bryce was addressing the Committee of One Hundred for the Future Development of Washington, he said: "In these circumstances, may not the city of Washington feel that its mission in life is to be the embodiment of the majesty and the stateliness of the whole nation, to be, as was well said by the previous speaker, a capital of capitals, a capital for the whole nation, overtopping the capitals of the several states as much as the nation overtops other states, representing all that is finest in American conception, all that is largest and most luminous in American thought, embodying the nation's ideal of what the capital of such a nation should be." Washington is one city that is peculiarly Uncle Sam's. It represents in a way that no other does the great government and nation for which it stands. And yet, while it is his representative city, his show city, it is unique.

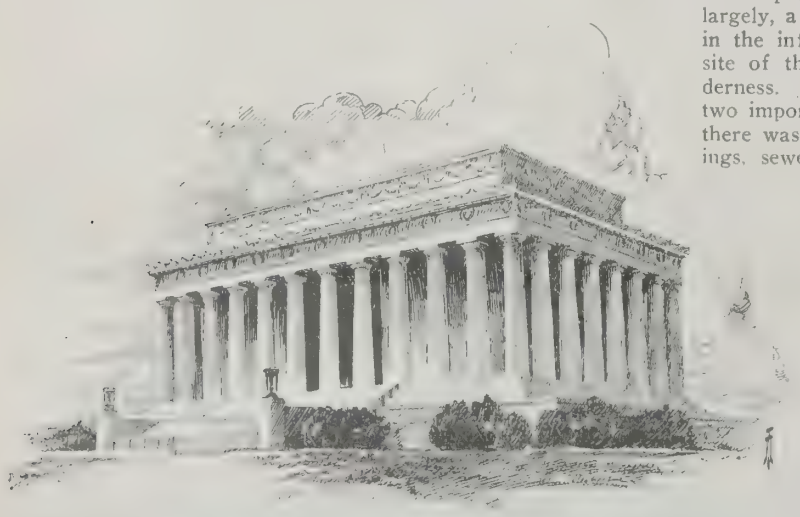
It is the greatest tree city.

It is the greatest park city.



It is the only city planned from its foundation.

It is the only city belonging to the entire nation.



It is the only city where Uncle Sam is the heaviest taxpayer.

It is the only city whose inhabitants do not have a voice in their own government.

The site chosen for the city was the result of a compromise. States and cities, North and South, had offered inducements for the privilege of having the proposed capital in their midst; but no state or existing city was given the coveted honor. A location was finally chosen between the North and the South, a district 10 miles square, situated on both sides of the Potomac River. The portion north and east of the river, ceded to the Federal Government by the state of Maryland, is now the District of Columbia, for the portion south and west of the Potomac, once a part of the District, was afterward ceded back to the state of Virginia. The present District of Columbia, some 65 square miles in area, lying between Maryland and Virginia on the Potomac River, is admirably situated for the development of a superb city. Uncle Sam, appreciating the fact that the city on the Potomac is his reception room, has taken pride in embellishing it for this purpose. In developing and improving it, he has been following, very largely, a plan which was devised away back in the infant days of the republic, when the site of the future capital was as yet a wilderness. And in his planning, he has had two important advantages. In the first place, there was nothing in the way of costly buildings, sewers, and other works, on or under the ground, that might prevent an ideal treatment; and second, he had the advantage of a master mind to plan for the future city, a man who planned so nobly that it took 100 years of growth for others to appreciate the full worth of the plan.

The impressive Peace Monument in Washington, a starting point of most of the capital's processions.

The beautiful Lincoln Memorial in Washington. It is now about completed.

Upon our first President, Washington, himself a surveyor of ability, devolved the duty of laying out the city. For this work, he called to his aid Major Pierre Charles L'Enfant, a young army officer and engineer, who had come to this country from France to help in the struggle for independence. To this brilliant young officer was given the task of planning the city, though Washington worked with him. The plan was so well conceived that the Fine Arts Commission, more than 100 years later, after visiting and studying the various European capitals, reported that "the L'Enfant plan cannot be improved."

"His plan is the basis of all that is noble in the design of Washington, and also the guide for future development. Hence the papers that embody his ideals have an increasing significance as the city of Washington develops as one of the great capitals of the world. If struggles with landowners and speculators exasperated George Washington, it would be expected that the high-spirited French visionary whose lively imagination saw beyond today, would go down before them. He did no great work after 1792, yet he lived till 1825, and his tall well-proportioned figure, arrayed in bell-crowned hat, long coat, and knee breeches, was daily seen making its way over the stump-strewn streets of the young capital which he designed, but for which others were getting the credit."—Report of the Librarian of Congress, 1920, (regarding a valuable acquisition of L'Enfant papers and documents).

There was a period of many years, following the Madison Administration, when the L'Enfant plan was forgotten—or worse—by men who probably were too "practical" to have any use for artistic effects or harmony of design; and so a number of government buildings have been erected in a style not at all in keeping with the original plan; and other buildings have been so mislocated as to mar very materially the unity of the original plan. This plan, for instance, did not contemplate the erection of a building where it would obstruct the view from the White House to the Capitol. It was President Jackson, we are told, who, in 1830, when there was a dispute regarding the location of the Treasury Building, thrust his cane into the ground, saying, "Build it here." And there it was built, with the loss of the beautiful vista down the avenue. (Doubtless many thousands of persons walking, riding or marching up Pennsylvania avenue have wondered why the Treasury Building stands out across the avenue like a sore thumb.) To offset this error, or rather to augment it, the State, War and Navy Building was erected at a later date on the opposite side of the White House, so that, in place of its having a commanding view in all directions, the White House is shut off from a view down the main avenues. More recently another important vista was destroyed by building the Library of Congress across Pennsylvania avenue, southeast.

This is the third library in size in the world, and second to none in magnificence. It was built in 1897 at a cost of more than $6,000,000. It contains more than 50 miles of shelving, and in 1920 held 2,831,333 bound volumes, besides immense quantities of maps, drawings, and other valuable matter.

Fortunately, the Fine Arts Commission in recent years has done excellent work in preventing the erection of permanent unsightly buildings, and in having most of the buildings that have been erected harmonized in architecture and in location with the general plan. This commission was created as the result of

a growing desire to develop the city artistically and worthily, which followed the commemoration of the 100th anniversary of the founding of the city. In harmony with the growing sentiment for the beautification of Washington, the Senate directed that a plan be prepared and submitted. The making of this plan was entrusted to Daniel H. Burnham and Charles F. McKim, architects; Augustus Saint-Gaudens, sculptor, and Frederic Law Olmstead, landscape architect. The first three of these and the father of the fourth had a few years before directed in the arrangement of the buildings and grounds of the beautiful "White City" —the Chicago Exposition of 1893. This plan, reported to the Senate by Senator James McMillan from the Committee on the District of Columbia, and later known as the McMillan plan, was an amplification of the L'Enfant plan, to make it conform to the growing city. There was no legislative action to make the plan authoritative; but later the Commission of Fine Arts was created as a permanent advisory board; and, in general, the recommendations of this commission, which is working for the development of the L'Enfant-McMillan plan, have been put into execution. Some buildings not erected in accord with the plan are now generally conceded to have been a mistake.

The bridge shown in the foreground of the picture at the top of the other page is the proposed Memorial Bridge between Washington and Arlington Cemetery. The unprecedented jam which occurred on the occasion of the burial of the unknown soldier on Armistice Day, when hundreds of automobiles were held up on the road, unable to reach the cemetery, has emphasized the need for pushing this feature of the McMillan plan.

The East Potomac Park recreation ground is shown at the lower right hand corner of the same picture. In the upper right hand corner is shown the Anacostia River, where a 1,000-acre recreation park is being developed. A National Botanic Garden is to join this park. Along the north side of the city it is proposed to build a boulevard, connecting with drives that will completely encircle the city.

Washington is unique among American cities in that it is the home of the Federal Government. It is "a capital of capitals." It has no other excuse for existence. It was located and built for a capital. Take the government away, and Washington could not support itself without a complete reconstruction.

It is unique among the cities of the world, in that from the first it was a planned city. It is true that Paris was partially torn down to make a more beautiful city. And it is true that other European and American cities are beautiful in spots; but, in the words of a Swiss writer in a Swiss paper, "Washington is a jewel." To get the full force of this expression, one should ascend some eminence, as the Washington Monument, or the Capitol dome, when the trees are in leaf, and drink in the surpassing loveliness of the bowl, largely hemmed in by hills, and so interspersed with trees and parks as to appear like a garden city.

It is unique in that it is the only American city in which the inhabitants are completely disfranchised. And yet it is probably the best governed city in the United States, for there is no opportunity for the petty politics and graft that mar the government of so many other cities. The city is governed by three commissioners appointed by the President. The laws are made by Congress, each House of which has a committee on the District of Columbia. The people of Washington are asking that at least they be given representatives in Congress, for the population of the District of Columbia is larger than that of some of the states. In view of the fact that the city has no vote, it has been divided into districts, each of which has its Citizens' Association, where the needs and the grievances of the community are discussed. There is also a central federation, made up of representatives from all the local associations, which brings before the congressional committee matters in which the people of the District of Columbia are interested. In this way desirable legislation is procured.

Washington is also unique—or has been unique—in that it has had no official recognition as a city. Since 1871, the Federal Government has recognized no "City of Washington." Congress appoints—one for each House—committees on the District of Columbia. All laws are made for the District of Columbia. The police force keeps order in the District of Columbia. The courts have jurisdiction over the District of Columbia. The commissioners administer the government of the District of Columbia. This, however, is only a matter of name, for Washington and the District of Columbia are the same. It may have been a source of consolation that the post office was still called Washington, that trains all came into Washington, and that the outside world knew it as Washington. Another source of satisfaction is the fact that President Harding has recently issued orders that all departments and bureaus and agencies of the Federal Government revert to the old name for the national capital—City of Washington. This order, however, probably will not affect Congress and the courts, which, presumably, will still deal with the District of Columbia.

Washington is also unique in the fact that Uncle Sam is the largest taxpayer. For many years, the Federal Government paid one-half of all the taxes of the city, or in other words, made an appropriation covering one-half the expenditures of the city. And he had the largest say as to what those expenditures should be. At the present time, the government pays 40 per cent, and property holders 60 per cent of the taxes.

Another unique feature is that the Federal Government owns all the parks and public grounds—of which there are many in the city—and places their administration under the chief of engineers, United States Army, except where otherwise provided by law; and by his order they are under the immediate supervision of the officer in charge of public buildings and grounds. The original thought, in having broad diagonal avenues, with open spaces at their intersections, was to have places of vantage that might be held by troops in case of insurrection. The artistic treatment of these squares and circles give an added charm to the city.

The area west of the Capitol grounds was marked on the L'Enfant map as an open plaza, affording an approach to that building similar to the one on the east. The plan of 1901 aims to restore this area. Railroad tracks which formerly crossed the mall have been removed through the building of the Union Station. At the present time the greatest obstruction to the development of the mall is the so-called United States Botanic Garden, a 10-acre tract, immediately to the west of the Capitol and at the head of the mall. A National Botanic Garden of 400 acres in the northeast of the city is to join the Anacostia Park.

Top—The Capitol dome by flood light. At least every American will admit that there is not another dome in existence that equals in grace and beauty the dome on our National Capitol. Center—Entrance to the White House. Bottom—How the mall will appear when present plans are carried out. The view is from the Washington Monument looking toward the Capitol. Running north and south at right angles to the mall is the cross axis, having the White House at the north end. The south end has been suggested for the National World War Memorial.

Fossil Men and Fossil Apes and the Scientists

Concluded from page 6

every expert from that day down has had an opportunity to express his opinion regarding them.

Huxley thought this skull quite ape-like, and also thought it to be of great antiquity. But it seems that no human implements were found in the cave where it was discovered, nor any bones of prehistoric animals. Then, too, the workmen who discovered these bones (for they were not found by any responsible scientist) seem to have been careless with them, and kept only the larger and better preserved ones. It seems impossible to determine whether this represents a skeleton which had been buried by friends, or whether these bones had been washed into this cave from the surface outside. As for the geological age which this skull represents, the only way to estimate that is from our opinion of the character of the skull itself. Virchow pronounced this to be a pathologic specimen.

In 1886 two nearly complete skeletons were found at Spy, near Namur, Belgium; and these have been thought to resemble the piece of a skull from Neanderthal so much that the whole of them have been classed together and have been erected into a distinct species of mankind—*homo Neanderthalensis*. Bones of the mammoth, rhinoceros and great bear were found along with these skeletons at Spy; but from the position of the bones it was evident that they had been buried by friends in the cave where they were found.

We have now seen all the essential facts regarding the four most famous human fossil remains found anywhere in the world, the crucial ones on which the ape ancestry of man is sought to be based, and which are always appealed to as proving the very great antiquity of man. It will be noted that all of them are of that delightful uncertainty as to character, as well as to their antiquity, which makes them such good subjects for discussion.

Three skeletons found at Cro-Magnon, Dordogne, France, are almost equally famous with those already mentioned; but they are such splendid specimens of mankind, that, according to the fourth rule quoted in the foregoing, scientists (who believe in these rules) will not admit these skeletons from Cro-Magnon to be of any very great antiquity, though according to the geological evidence they are as ancient as the skeletons from Spy. What is called the old man of Cro-Magnon had a splendidly developed skull. He was more than six feet high, and with a splendid physique, the skeleton showing "evidence of immense muscular development" (Sir J .W. Dawson.) Keith says that this race "was the finest the world has ever seen."

Recent discoveries in geology have raised the whole question of the accuracy and reliability of the geological classifications. Among other things, the great areas where the rocks have been found in the "wrong" order, the so-called "older" on top and the so-called "younger" below, as in the Rocky Mountains of Alberta and Montana, have, in the minds of some scientists, thrown the whole question of the geological "ages" into the melting pot. Some geologists think they have explained these matters in such a way as to save their theory, but others have grown quite skeptical.

But even if we do not harbor any suspicions regarding the geological theories of the various ages of the different stratified deposits, it seems to me that we cannot feel that these human fossils which we have been examining help us in the least in trying to gain an idea of the character and the surroundings of the first human beings. If some one thinks that man must have started out on this earth in a splendidly developed condition from the very beginning, and if he points to the specimens from Cro-Magnon as being just as old as any human fossils hitherto discovered, I do not know of any real scientific facts which can be produced against his view. And if he thinks that these skeletons represent the splendidly developed early ancestors of our race, there can be nothing presented against such an idea, except a long series of hypotheses and theories.

"Imaginary Money"—Gold Basis Full of Fakes

Too Many Banks—Banking Functions Second to Speculation and Dividends

By A. R. PINCI

THE general stock of gold coin and bullion, silver dollars and subsidiary coins and bullion, but not including minor coins, was $3,786,221,846 on July 1, 1921. This grand total varies constantly, and the United States Treasury issues a daily statement showing its fluctuations in detail. The above date, however, has been selected for the purpose of this article to facilitate comparisons with available information of related nature.

On that day the per capita gold and silver stock in this country was about $35.02, although the official per capita circulation was, according to the Controller of the Currency, $53.44. The difference—$18.42—is imaginary money, if one wishes to consider the remaining gold and silver as money.

Roughly, one-third of the per capita circulation in the United States was on that date nothing more than faith or hope, although this is not the only instance where the gold and silver stock of the Treasury is insufficient to guarantee a full per capita quota of either metal on demand.

On July 1, 1921, individual deposits in all reporting banks in the United States and island possessions amounted to $35,459,155,000, or almost 10 times the value of the gold and silver coin and bullion of the nation. This fact bears out the contention of noted authorities that as things stand today in the United States, nine-tenths of business is credit and one-tenth is cash.

The banking power of the United States on the same day, represented by the combined paid-in capital, surplus and profits, deposits, and circulation of all reporting banks, including national and state, non-reporting private banks (estimated) and the 12 Federal Reserve Banks, was $48,219,900,000.

If All the People Drew Their Money!

THIS sum is indeed ample, offhand, to take care of all deposits, exceeding these by more than one-third, but the fact remains that this money does not exist.

"What would happen," I asked a former high official of the Treasury Department, "if some day by simultaneous tacit consent every depositor resolved to withdraw his money in full?"

"The banks would have to close."

"But would the depositors get their money?"

"No; how could they? There isn't that much money in the world, translated in gold and silver, and the hypothesis is that gold and silver, or their equivalent in Federal paper money, were wanted."

Right here, then, enters a situation that professional bankers will not admit exists, that the average person cannot understand, and the common-clay legislator does not know how to regulate. The bankers thrive on a turnover of the actual cash circulation, and the greater its velocity the more business, plus the apposite turnover of credit business, which is about nine-tenths greater.

By means of involved legislation, the government has conferred the right to certain banks to issue paper money, at the end of the last fiscal year there being $704,147,000 of national bank circulation. This "money" is well scattered, and performs its functions like the United States gold and silver certificates, but these functions originate with the United States Government, and to the banks of issue they are little more than a paper advertisement.

As a medium of value the average man and woman accepts the bank note as readily as a United States certificate, but there is an element of psychology in this, namely, that the bank of issue to this extent represents the government of the United States. If the bank should not honor the note the holder will look to the government of the United States.

Private Banks With Public Privileges

IS IT logical, under this single circumstance, that the government should grant this right of issuing money to private or semi-private institutions, and let these banks profit through this privilege, and at the same time enable the banks to manipulate the distribution of these funds in a manner tending to bring the greatest possible profits to the banks themselves instead of the people at large?

The real reason behind the more recent banking acts of this country was to prevent the accumulation of a huge surplus in the Treasury, where it would do no good by remaining under lock and key. Withdrawing this money from commercial arteries was like bleeding a sick man who needed every drop of his blood. The original plan of placing this surplus money with the banks led to abuses because banks with political influence obtained the lion's share. The Federal Reserve Act was passed with a view to maintain and even increase the liquidity of assets, but judging by recent experience the 12 Federal Reserve Banks have practically remained a closed corporation because managed by professional bankers in accordance with faulty banking practices.

At this time there is an agitation in the Senate against the Federal Reserve System, rather than the board itself, and just how professional legislators will handle it remains to be seen. The worst thing that can be said of the Federal Reserve Banks—as anybody who is familiar with the fundamentals of banking may easily ascertain—is that like the banks from which they beget life and power, they regard themselves as private institutions for private gain.

That banks are public institutions, and should be regarded as public utilities, in fact, and administered under some such law, has been realized by quite a few independent thinkers who have gone to Washington with the hope of legislating accordingly. These hopeful ones little dreamed that our banking system is most privileged, protected, independent and autocratic. Banking legislation does not follow in cycles like legislation of other character. Had it not been for the panic of 1907 the National Monetary Commission would probably never have been organized, and I have the late Senator Aldrich's word for that. After organization it devoted three or four years to studying banking methods and systems abroad. The analyses were many, the conclusions more or less excellent, but the fact is that it dragged through three administrations before it brought results.

There are any number of legislators at Washington, and not a few business men scattered throughout the nation, who have reached the conclusion that there are now too many banks in the United States, or if not too many, at least the limit of such saturation has been reached. This is true, of Washington, D. C., to take a single city as an example. It is not a business community; it has little need of unusual banking facilities, credit operates within well-defined, circumscribed limits, the average earnings of a predominantly clerical population are under $1,300, the banks themselves are weighted down with accounts running under $10 balances, the turnover is a matter of three days after each semi-monthly pay day, with little business the rest of the time, yet the banking fever is at high mark.

If banks find it profitable to organize in communities where banking facilities are apparently more than adequate, or should be, it must follow that there must be tremendous profits in banking. The answer is that money is much dearer that it otherwise might be.

Taking the composite view of many economic authorities, banks have ceased to be instruments of distribution under government supervision, and have become private speculative ventures. The immediate object of a bank is to return the highest possible dividend to depositors who are unable themselves to make use of their surplus money and therefore find it convenient to become stockholders in a bank. In fact, it is more fashionable to own stock in a bank than in any other business corporation.

Taking such official figures as I have obtained from the Treasury Department, according to the returns of December 29, 1920, the paid-in capital stock of the 8,130 national banks was $1,272,291,000, divided into 13,945,663 shares with an average par value of about $91.25. They were owned by 519,107 shareholders. National bank stock is everywhere at a premium; but some of it is almost impossible to get, even at current market rates, sometimes multiple times par value ($100).

Bankers as Profiteers, Not Financiers

IT IS difficult to separate sheep from goats, but just how many of those stockholders (as well as many more to come, especially as new banks are organized) are mere hangers-on, parasitic capitalists, insatiable speculators? This gentry is discernible in other lines of business, but banking is more genteel, more segregated, more protected, and therefore more advantageous.

The banks that during 1921, despite retarded business, diverted huge profits in improvements of external kind, bonuses, stock dividends beyond all reason (and still were in a position to make stupendous additions to their surplus), were very many. They were especially numerous in that privileged territory south of Boston, north of Washington, east of Pittsburgh, not overlooking Chicago proper.

The banking business being the business *par excellence* of the cultured, moneyed, influential, powerful elements of any community, and being further privileged by law because it deals with the coin and currency of the nation—government evidences of indebtedness—it is obvious that its position in the mind of legislators should be privileged. Add to this the fact that the average legislator knows no more about money, and the principles of money, than the man in the street, and the difficulties which he will encounter as soon as he attempts to modernize our banking and fiscal laws, become manifest. Nor is that all.

Bankers themselves, as a rule, are not students of the history of money. In this unread category I especially count in the hosts of professional bankers who today are in a position to dispose of the fortunes of more or less fortunate borrowers; that class of artificial dealers in money, rather than bankers, though they parade under the latter name, who by mere chance become identified with a bank in the same way that other men become butchers or haberdashers, and eventually achieve a position of responsibility, of a kind, within the bank. They know that they can lend money under certain restrictions, and can understand certain elementary operations between banks, or between banks and patrons, but of the constructive qualities of money, of the hundred and one circumstances about money, metals, commodities, standards of value (a misleading term) and so on, they know nothing.

As an instance of this, I relate a story told me in New York City. I have reason to believe it true. It shows cleverness but not necessarily constructiveness. A very important concern of the metropolis, able to show a perfect statement—the kind which induces a self-styled banker to O. K. for credit authorization and makes him feel that he is a discerning individual—borrowed something like $200,000. This money was invested in bonds paying much more than the preferred interest rate charged to this gilt-edged borrower. The purchase, by the way, was made to add to the year's earnings when it was felt that 1921 would be somewhat sluggish. By the usual operation of renewing the loan, the borrower was enabled to make a nice showing between the outgoing and incoming interest—a no mean sum in the course of nine months.

Of course, the bank was safe; its loan was as good as gold. The borrower's assets were stupendous. As a bit of business that would react in favor of that bank's stockholders no improvement could be possible, but in reality, what were the results? It led the borrower to look for profits in a business that was distinctly a side line, and not at all mercantile; in fact, despite safety, it belonged to the province of speculation. It is quite possible that the borrower, sure of this extra income, forewent other direct opportunities to boost its own business. It played something safe. It was good business; it was original business; but it was not constructive.

Banks Are Now Up for Scrutiny

THERE is the other side. The borrower absorbed a huge sum of money that the bank might have loaned to some really constructive borrower. Last year, for instance, many a small industry was retarded many years in as many months for the lack of easy access to money. The financial statements may not have been patterned after the banker's own dream of a statement, but money more widely distributed, more directly assigned to industry, with its related employment and spending power all along the line, even at the risk of some greater responsibility on the part of the banker, would have led to better results. But the stockholders—think of them!

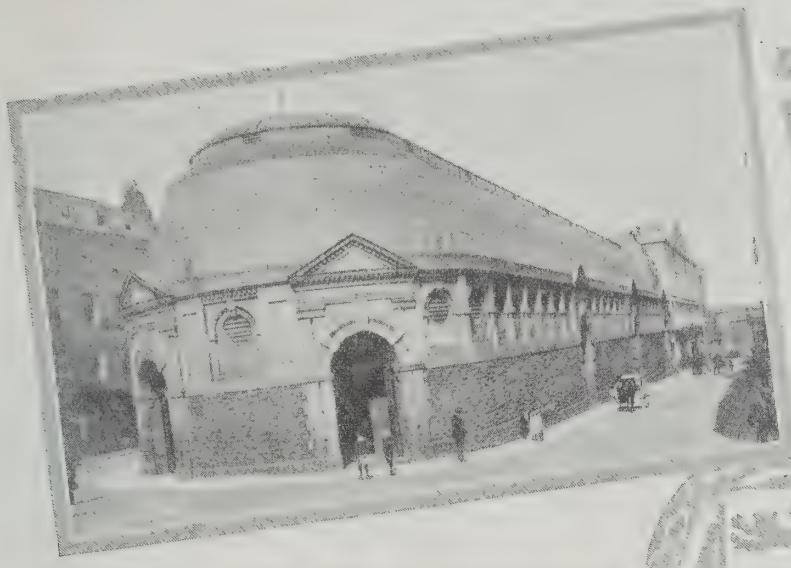
It is this class of bankers that has run headlong into a mess of trouble during the latter years of the war and the first year after its close. As long as foreign exchange was favorable, and arbitrarily suspended at a given point by governmental fiat, profits were inevitable. As soon, however, as the exchange market broke, and trading must be resorted to, many a well-known banker quietly withdrew from the foreign field. One bank, according to Wall Street reports, lost enough millions to require a change of executive personnel and the closing out of affiliated banks organized when dividends could not be held down. Half a dozen of some such experiences and the leading bankers have lost all taste for foreign banking. If foreign trade to the United States will ever mean anything in the future it will be despite its bankers and not because of them.

But to return to the main argument, American banking has reached a point where it should either show results in behalf of the people or be made amenable to regulatory laws. The very fact that bankers have shied at public criticism because they deal in coin of the United States and regard themselves as government fiscal agents, more or less, should lead some energetic legislators to enact some sort of controlling law.

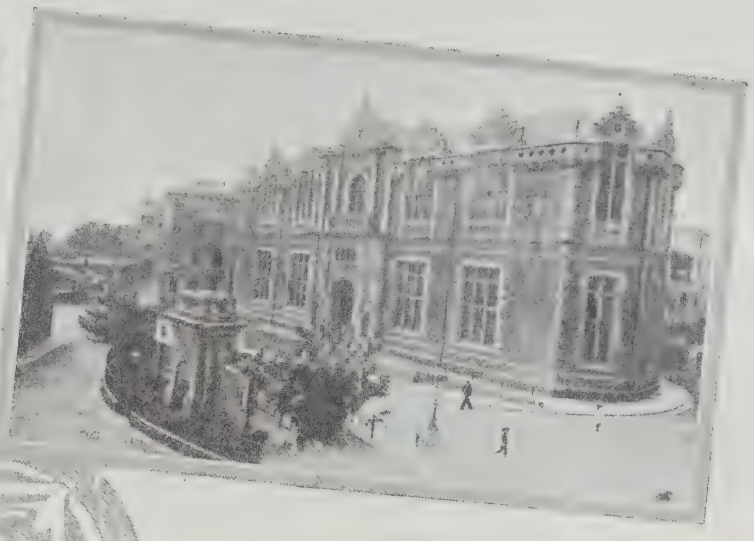
Just now the banking interests are centering their fire against the provision to have a "dirt farmer" on the Federal Reserve Board. The bankers consider it discriminatory legislation. They are privately abusing the President for compromising with members of the Congress on this amendment. But, turning things backward, to get at the point quicker, why was it necessary at the very beginning to provide by law *two bankers?* Even one "dirt farmer" cannot cope with two bankers. The obvious thing to do would be to rewrite the entire personnel paragraph, and as to whether classification by trade or profession is necessary little may be said as long as Congress retains the right of selection or rejection of confirmation.

"Banking" Is Incidental to "Dividends"

CERTAIN of the Federal Reserve Banks have pyramided such stupendous surpluses by means of manipulation of funds as to have shocked all those who have no reason to follow the reserve bank's band wagon. But unusual and questionable as these conspicuous instances have been, they should not be permitted to obscure the much more important effect of the harm done by countless banks throughout the country whose "banking"—using the term literally—is incidental, but whose main operation is to earn dividends for stockholders. There are many such banks, and their number is growing, especially in certain obviously bank-ridden communities.



It is by the way to claim that the bank stockholder contributes his bit to the wealth of the nation, because while that ought to be primarily and solely the object of the investment if banking were not reduced to its present flabby stage, the actuality is somewhat different. In fact, very different.



The bank should act as a link between owners of capital and users of capital. The two terms are far from synonymous. They are becoming so less and less. The ranks of professional owners of capital increase as the ranks of users of capital are reduced by attrition. It is being made more and more difficult for legitimate and hardy users of capital to borrow—consequently there is an overabundance of stock and bond corporations whose aim is to make money easily, and with the least possible labor, which accounts for the disgraceful industrial situation in many parts of this country. Men anxious and willing to work for a fair wage, and capable of doing what

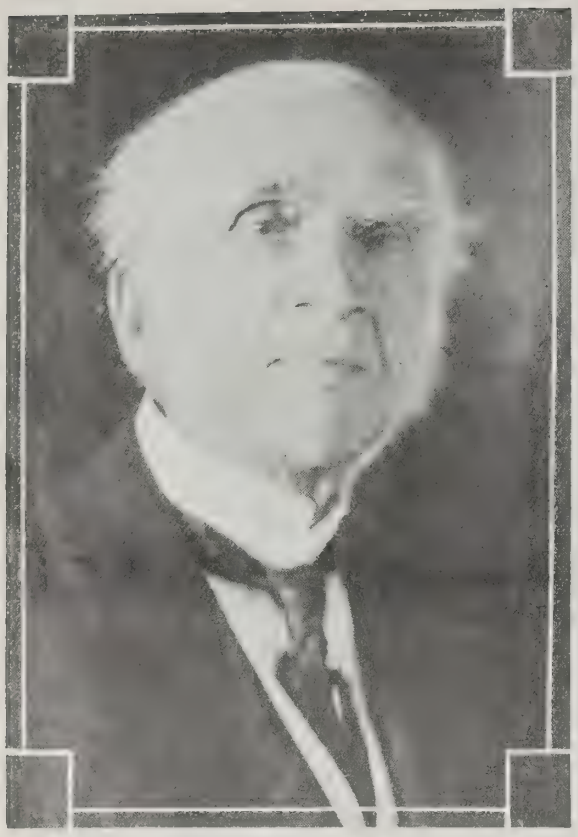
Where Money Is Not Based on Gold or Silver

Guernsey Isle Issues Notes Against Public Improvements and Escapes Paying Interest



Scenes on Guernsey Isle, where public market buildings were erected and other improvements made by the issuance of paper currency, without a gold or a silver basis, the notes, or currency, being issued against the improvements. Interest was thus eliminated, and the improvements paid for themselves. At the top, left, is the rear of the new fish market at St. Peter Port; top, right, a front view of the market; below the picture of the rear of the market is a view of Market Square; center, map showing Guernsey Isle in the English Channel, and its location relative to England and France. At the right of the map is a picture of Clifton Steps, St. Peter Port. These steps serve as a public highway; left, below the map, is a view of a section of the interior of the market house; bottom, left, a panoramic view of Guernsey; right, another view of the market place, showing a corner of the new market in the left foreground, and a corner of the original market, built in 1822, in the center background.

(C) Bachrach

DR. STEPHEN SMITH,

Founder and first president of the American Public Health Association.

Can We Live a Hundred Years?

This Centenarian Says All of Us Should

By CHARLES H. LERRIGO, M. D.

MEET Dr. Stephen Smith, of New York, who, in 1922, is celebrating his hundredth year of residence on this earth. He is not the "old Dr. Smith" of greatly advertised memory. As a matter of fact, he resents the adjective "old." Dr. Smith is a real doctor of medicine. He has always been interested in movements to promote healthful living, and is a pioneer in public health.

Fifty years ago, when the American Public Health Association was born, Dr. Smith officiated at the ceremony. He was its first president. Last November, the association, now grown to be a mighty power in the land, held its semi-centennial in New York City, and made it an occasion to honor its first president, striking a medal which bears the imprint of his features.

Dr. Smith, vigorous and energetic, appeared at the meeting and declared that he had a tremendous announcement which he would make at the banquet given in his honor. When the time came, he calmly broached to the hundreds of visiting physicians, and other men of science, the audacious statement that instead of his age being exceptional it should be the rule, that *all* men should live to be one hundred.

"We have too long been content with the Mosaic dictum which places man's life at threescore years and ten," said he. "We now live under very different conditions. Science holds sway. Man's physical construction is adapted to a service of 100 years. Let us push our standard forward 30 years and count man's normal life a century."

A common belief exists that our ancestors lived much longer lives than we of this generation. Accounts of very aged persons spring from the records of olden days in great profusion.

England's Westminster Abbey has a monument to Thomas Parr, an "old, old, very old man who lived in the reigns of 10 kings," and died at the age of 152.

In Yorkshire, England, there is a monument to one Henry Jenkins, an English laborer, setting forth the interesting testimonial that "he lived to the amazing age of 169."

Many Live to Be 100 and Over

IT WAS claimed for a Hungarian of the name of Pierre Zortay that he lived to be 190. Norway had a claimant for honors in the person of Drakenburg, who admitted himself to be 146 when he died.

Every country worthy of consideration entered at least one candidate in the Old Age Tournament, the apex of their claims being in inverse ratio with the reliability of their registration records. Some of the claims modestly submitted by natives of tropical countries might well make a certain Methuselah tremble for his record.

Of course, one is constantly reading newspaper items and patent medicine advertisements that speak lightly of ages that exceed the century by many years. They are records of tradition rather than fact, however, most of them having reference to illiterate persons who find counting by multiples of 10 to be the easiest way.

But the fact remains that persons do live to be 100 years old and over, and evidently many more accomplish it than a British authority would credit. The Britisher, however, made his investigation into lives lived more than a century ago, when the expectation of life was much lower than it is at the present day. By "expectation of life" is meant the duration of the average of human lives from birth to death. It is impossible to say what this may have been in the days of Moses, but a glance back over known facts for the last three centuries is instructive.

Records kept in Geneva, Switzerland, show that seventeenth century lives averaged a little more than 25 years; eighteenth century brought the average up to 33 years, and nineteenth century, from 1801 to 1883, gave a record of nearly 40 years. In our own country, the record was a little higher, and by the close of the nineteenth century we had reached 45 years. We have marched on at a still better rate since then, for the expectation of life in the United States in 1910 was 51½ years and, although absolute figures are not available, it has undoubtedly increased in the last decade.

Let us see why we live longer. It is only a step back to 1878, when a great epidemic brought 125,000 cases of yellow fever to the Mississippi Valley and caused 12,000 deaths. A century before, in 1793, the disease had invaded Philadelphia and caused the death of one-tenth of the city's population in six and one-half weeks. But in 1900 the discovery was made that yellow fever could not spread unless carried by the Stegomyia mosquito, and thus the disease became a terror of the past.

Few persons realize how nearly typhoid fever is conquered. The work has been going on so quietly, yet so steadily, that the death rate has dropped almost without notice. Yet statistics show that whereas in 1900 some 36 out of every 100,000 citizens of the United States died of typhoid, in 1919 only nine per 100,000 succumbed. Given a continuance of the 1900 rate, some 27,000 more Americans would have died of typhoid in one single year.

Everyone has heard of the tremendous victory gained in the fight against tuberculosis. It has decreased 37 per cent in 12 years, and is still losing.

Little children do not die from summer complaint as they used to do. In 1900 two babies out of every five died without a chance to reach their first birthday. Now less than one out of five meet such an early doom.

These victories over disease have not been due to the discoveries of wonderful new medicines. With the possible exception of the use of anti-diphtheritic serum in fighting diphtheria, the improvements have been altogether along the line of prevention of disease.

Watch the Little Things

IT IS to prevention that you must look if you are personally interested in joining Dr. Smith and his group of centenarians. You must discover the "little things" and give them early attention if you would check the degenerative diseases that are apt to rob you of your prime. Few indeed are the deaths that occur from genuine "old age." Men go to their deaths with bodies capable of splendid function save and except for one damaged organ. Perhaps it is the heart that is at fault, perhaps the kidneys are incompetent, possibly some other organ. But searching back to the real point of origin, there will be found some apparent trifle, a few decayed teeth, a little shortness of breath, a slight cough that might have been corrected easily if taken in time.

Let us be sensible. Modern aids to diagnosis make it quite possible to find the flaws in the human machine while there is yet ample opportunity for repair. Once a year submit your body to a searching examination by a skilled physician. Place no confidence in the smiling, urbane individual who can tell at a mere glance that "you are perfectly all right." Go to a real medical man, one of the kind whose researches stopped yellow fever and are conquering typhoid, and pay him a reasonable fee for a thorough examination. As long as you go quietly along from year to year, repairing small faults before they grow into big ones, keeping up efficiency regularly, there is no reason whatever why you should not be developing into full power in your 80's or 90's and placing yourself securely in the list of those who may see "a century well done."

"Imaginary Money"—Gold Basis Full of Fakes

Concluded from page 12

they know how to do, are unemployed. Capital is not reproducing.

Now, if it were true that individuals who are so anxious to subscribe to new banks, or who speculate in stock and rights of the old ones, are minded to add to the available capital to distribute, they will be content with a fair, equitable, and justifiable interest rate—a rate that shall compare adequately with the average rate in other lines of business. But unfortunately there are any number of individuals who will not subscribe to new industrial corporations with the same readiness that tempts them to become bank owners. Banks never pass dividends.

That regulatory legislation will come sooner or later is not to be doubted; the development of the United States gives every proof that any business that affects the well-being of the people, and is abused, soon must capitulate to political surgery, which hampers rather than cures.

A generation or so ago hardly a railroad stockholder worried about dividends, given a judicious investment, and probably none foresaw the day when rates would be regulated, but the worse day when he should be obliged to appeal to the government for a guaranty of returns on the investment.

The Mystic Money Word—"Sit Tight"

THE analogy between railroads and banking is very close, much more so than appears upon the surface. It would be well if the bankers saw the light now, before the irritation or complaints of harassed users of capital shall be transmuted into political propaganda with a view to enforce a readjustment.

Everybody today complains of the scarcity of money. The bankers I have talked to tell me and reiterate that the demand for loans is insistent, but the word—the elusive, mysterious word—is to "sit tight." Now it cannot be true that the banks cannot supply the money. Of money there is even too much—in idleness. The existing stringency is not due to reduced volume of currency, as was the case in other years, when like conditions existed, sometimes precursors of panics, but due to the curtailment of loans and discounts.

It is admitted that credit means the putting of capital into the hands of individuals or groups that without being the owners of it can use it to the advantage of both. Money by itself is utterly useless unless it can be exchanged for means by which matter may be consumed and reproduced, and the greater the margin of this reproduction the quicker the profits (or interest.) But the money itself bears no profit. By itself it cannot yield interest. Money must be immediately transformed into commodities to justify its existence.

Lending money is an extension of credit if borrowed upon the mere promise to pay. It is obvious that collateral loans are not credit, but an exchange of something tangible for something else tangible, less the margin considered safe to carry out the transaction—a margin that sometimes is utterly ridiculous by its needless greatness. It means transferring liquid assets for other assets. But unsecured loans mean transferring wealth or assets already extant in exchange for a simple promise. Credit, too, like money, creates nothing by itself; it must be turned into commodities, promptly, efficiently, equitably, before it can yield a profit—and this profit is attained by reversing the process, of course.

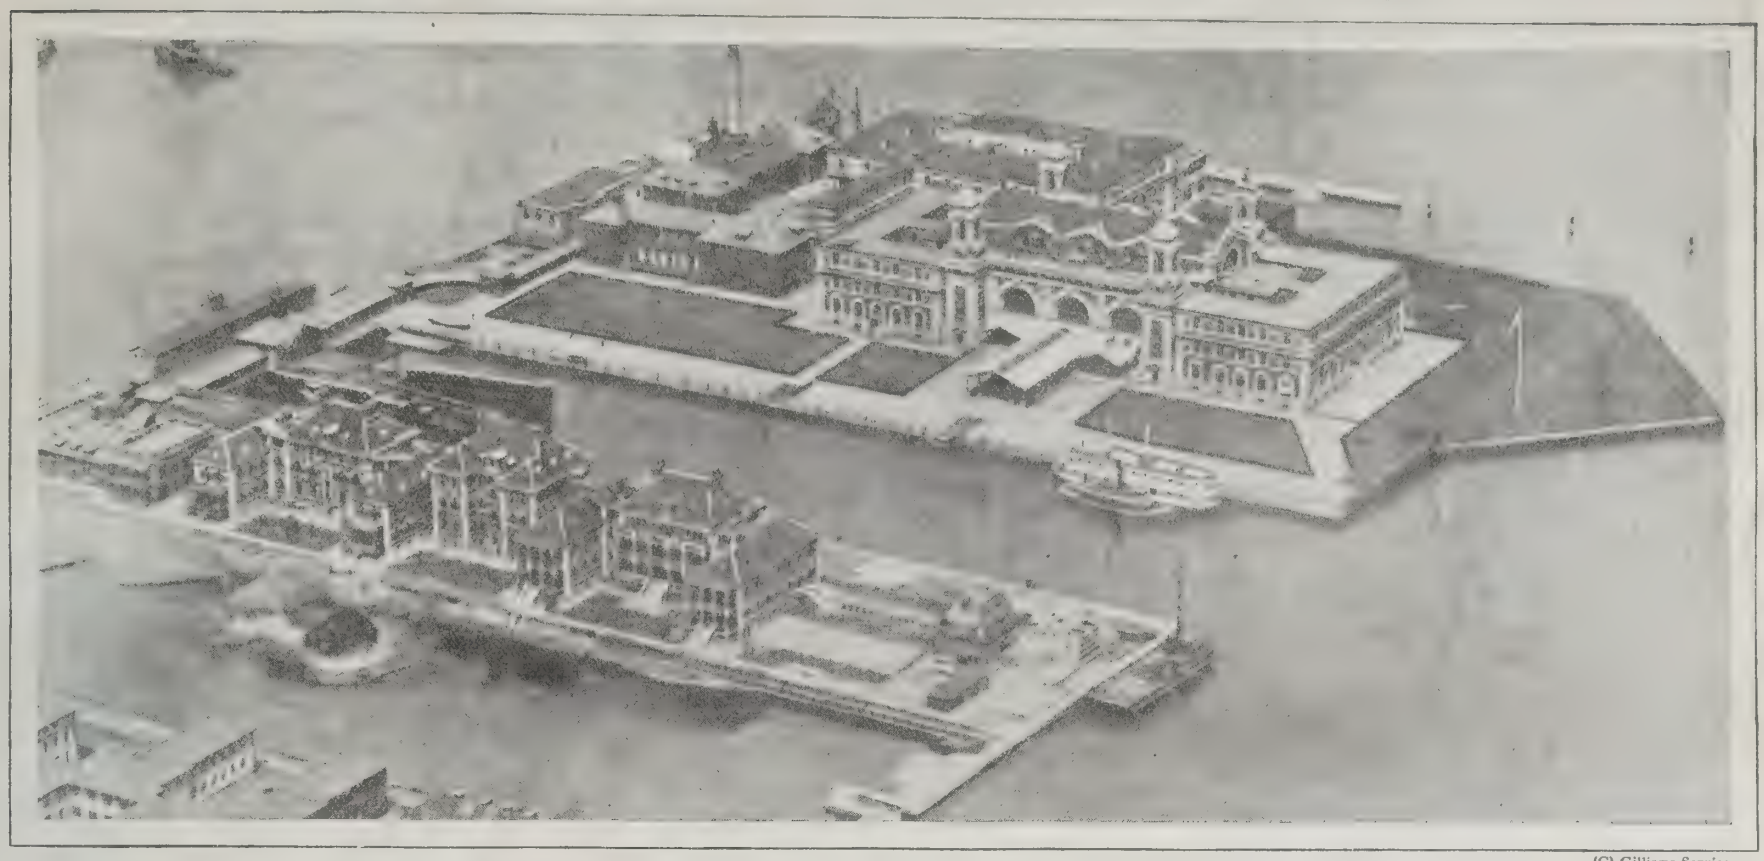
Probably one of the greatest ills of today, under the complicated system evolved by a chain of interrelated interests, is that which stretches out the process of extending credit, or lending money. Now it would not be so bad if the transaction were between banker and borrower, but the thing is generally apt to have one or more middlemen.

The owner of surplus funds, unwilling to invest, may make a time deposit, for which the bank pays him a fair rate of interest. This money is in turn borrowed by one of the many brokers that now infest our industrial centers; and the broker may use it for indirect loans—by buying negotiable paper, probably gilt-edged notes, acceptances, and this discounted paper in turn may travel further. But it is manifest that there may be a big jump between the maker of the note and the original investor; and each transaction, scaling down as it does by fractional percentage in normal times, is an additional burden upon the last borrower. That these fractional percentages are not to be sneezed at is proved by the prosperity exuded by these brokers. They are the worst kind of middlemen.

If our present banking system is perfect, or almost so, as many bankers aver, then these brokers should be uprooted from the financial stratum of industry, because they are parasites; they contribute nothing but a turnover at the expense of the man probably least able to stand the loss—the average borrower.

Suggestions Toward Better Bank Service

SEVERAL things should be done to improve the situation, with or without legislation, depending upon circumstances:



1. Drastic regulations restricting the number of banks in communities on the basis of population or turnover.

2. Regulation and restriction of brokerage houses, of which there are too many, permitting to unscrupulous bankers quick returns, subterfuges not possible under existing banking laws to the bank proper.

3. Control and regulation of all bank profits, based on an elastic scale to provide for financial market variations, and a further provision that all profits in excess of a certain maximum shall revert to the Treasury of the United States. (If the government has considered it its province to regulate public utilities corporations, arbitrarily fix and limit returns, in pursuits not at all directly or indirectly related to Federal sources, then the government is entitled to control any and all banking institutions and their returns, since they profit from a turnover of money which is exclusively public property. Under existing conditions banks are "supervised and controlled," but only technically, since these banks are practically licensed to manipulate public funds for their own immediate benefit.)

4. Prohibiting interlocking directorates, which enable privileged officials to extend among themselves reciprocal favors.

Here's Where Our Immigration Troubles Begin

(C) Gilliams Service

Airplane view of Ellis Island, the gateway to America for thousands of aliens.

"IT'S now or never," declares the *Saturday Evening Post,* editorially, in demanding that the entire immigration policy of the United States be rewritten into one comprehensive piece of legislation that will prevent the continued influx of tens of thousands of undesirables from Europe.

The *Post* is one of the few American publications whose editors have realized what the inundation of present-day immigration means. Its influence is, of course, tremendous, for it reaches several million persons weekly. Its arguments are never hysterical, always based on the soundest of reasons, and backed by incontrovertible evidence presented by its staff writers.

This publication, in connection with its desire to see restrictions placed upon the alien horde that is flooding in today, and threatens even greater proportions upon the expiration of the three per cent legislation adopted a year ago, urges the formation of a non-political, expert, immigration board.

In its argument, the *Post* says, "there is an insistent nation-wide demand for a body of permanent immigration law that will meet existing conditions squarely and adequately before it is too late—law framed frankly and avowedly for the sole benefit of America and Americans, present and future, and not for the pleasure and convenience of foreign-slum populations, nor even for the gratification of those citizens who are working to get all their European or semi-Asiatic kith and kin ferried across the Atlantic."

The "Publicity Man" and Washington News

Concluded from page 8

licity in the Liberty Loan campaigns of the war. The newspapers published columns and many magazines carried articles on the "disclosures" made at the hearings. Anyone not in sympathy with the point of view of the street railway managements was free to come forward and be heard and a few did so. But the public heard of little of what they said. As far as most of the newspapers were concerned the "hearings" were covered by the publicity men employed by the street railways.

Most people will recall the "coal scare" of 1919. The bulk of newspapers throughout the country published articles, often emphasized by editorials, urging consumers to buy the next winter's supply of coal quickly or take big chances on going without.

There is much reason to believe that the "scare" almost wholly was the product of propaganda put forth by the operators for the purpose of keeping up the price of coal. In fact, it was so charged, and what he said was backed up by evidence that at least raises serious suspicion, by George Huddleston, who represents the coal-mining district of Alabama in Congress. He showed how the coal operators put forth telling "scare" propaganda to the effect that a serious shortage of coal miners threatened sufficient production while at the same time the United States Labor Department was reporting extensive unemployment among miners in several of the coal-mining districts. But the propaganda, coming on top of the coal-scarcity days of the war, produced such a scramble for coal that there resulted a panic which came very near to demoralizing the coal industry. The coal association, finally in 1920, had to combat the propaganda of the year before.

Mr. Huddleston told of how even the Associated Press had been imposed upon during the time of the "coal scare" propaganda.

Newspaper Man's Big Fees From Corporations

IF ONE wants to pursue the matter further, he can find in the report of the hearings before the Calder Committee, on Reconstruction and Production a copy of a letter, written by the director of publicity for the coal association, in which details are given as to how reports of even the Associated Press were influenced favorably to the operators. It was introduced in the hearing by Senator Kenyon.

Most propaganda issuing from Washington or directed there is of the open kind—much perhaps is of desirable if not commendable kind. No one knows how much is carried on under cover.

In the "leak" investigation of late, 1916, it was disclosed how some members of the press galleries in Congress were often retained by industrial and financial interests to supply "inside" information or advise about national affairs.

One witness in that investigation was Thomas F. Logan, at that time among the most prominent of Washington newspaper correspondents. He testified that he represented the Philadelphia *Inquirer* and *Leslie's Weekly,* as correspondent, wrote editorials for the Washington *Post* and the *Wall Street Journal,* and articles for the *American Economist.*

About two years later, Logan was again examined, in connection with the investigation of the meat packers. It was disclosed that his newspaper work was largely incidental, certainly in its relation to his total earnings. For "information and advice" he was being paid $500 a month from Swift & Company, $500 from the Standard Oil Company of New Jersey, $500 from the Standard Oil Company of Indiana, $700 from the Atlantic Refining Company, $500 from the Freeport Sulphur Company and $500 from the General Electric Company. It was also disclosed that he was the confidant of many persons high in the national administration and had even accompanied one, at government expense, on an official trip to Europe. Since then Mr. Logan has operated an advertising agency.

Majority Are Free From Influence

LATELY, those in charge of the congressional press galleries have been vigilant in applying the rule against any correspondent with "side lines" enjoying the privileges of the galleries.

It is well known that in some respects at least the rule can be evaded. Members of Congress are dependent largely on the reports of correspondents for papers in their districts or states for the right or wrong impression made on their constituencies. Naturally, they cultivate friendly members of the press, especially those representing their home papers. Frequently a Congressman or Senator has the disposal of a government sinecure, that is, a job calling for little or no work. Thus often a correspondent is carried on the rolls of the government, but when such is the case he cannot occupy the press galleries. But if occasion arises whereby a member of Congress has opportunity to hand a correspondent who is in the gallery a subsidy out of the United States Treasury, it is not impossible, the correspondent being willing, for a member of the correspondent's family or a friend to go nominally on the pay roll as a substitute for the writer. This form of abuse is not common but it is employed.

In fact, not a great many correspondents in Washington are paid enough by single newspapers to maintain them at the capital. The bulk of them work at the same time for several papers, although the big city newspapers maintain bureaus with staffs ranging from one to a half-dozen men. If the average correspondent is unable to get a "string" of papers he must eke out a livelihood by getting on the clerkship staff of a member of Congress, by securing some other political job or by doing "publicity" or something else of the kind "on the side." On the whole, however, the newspaper men who make up the corps of Washington correspondents are as free, if not freer, from influences that might affect their dispatches as the staff workers on newspapers in the average city of the country. The writer has known of cases where virtually every member of a newspaper's reportorial staff was taking retainers for outside work, usually "publicity," and often with the knowledge and full consent of their employers, who thus were relieved of annoyances about salaries.

In Washington the temptation for the independent newspaper man to leave the legitimate field for that of propaganda or to share, anomalously, his talents with the two is probably greater than anywhere else in the country. For in Washington nearly everybody has an eye to "publicity."

When preparing to write this article, I called on a Congressman friend at his office to ask him what he thought as to the effect propaganda and especially "news publicity" propaganda has on the actions of Congress.

"Virtually none," he said. As he spoke a newspaper man acquaintance entered the office. The Congressman reached for his check book, wrote out a check and handed it to the new caller who thanked him and left.

Congressmen Themselves Use It

I LEARNED that he represented what will be called the Blank News Service whose chief business is to send from Washington "news" about its clients, chiefly members of Congress! Blank, who established it, has long been recognized as among the ablest of American newspaper men and has held many big positions in the editorial and reportorial field. But he evidently finds it much more profitable to deal in "canned" than in real news.

And though the average member of Congress and other Washington officials will tell you that "propaganda" has little effect on national legislation and administration, you are warranted in suspecting that he is the victim of some measure of self-deception, for the reason that scarcely anyone in Washington is readier to make use of propaganda and especially of the publicity kind either in behalf of his own political interests or his ideas than the said average member of Congress or administrative official.

It is not "straight publicity," no matter how voluminous it always is or however artful it occasionally is, which produces the greatest confusion with regard to Washington affairs or serves most effectively as "propaganda." The most effective operators, either of the good, bad or doubtful sort, use publicity only as a seemingly easy ally; they employ other weapons of far greater significance and effect.

THE LIBRARY OF THE UNIVERSITY OF ILLINOIS URBANA ILL

BRIEFLY TOLD

The bridal veil of Princess Mary was the one worn by Queen Victoria and Queen Alexandra.

Insects of the United States destroy $1,100,000,000 worth of farm produce a year, according to reliable reports.

Tank cars, with glass lining and insulated with cork, are used for storing milk in Pittsburgh. Each tank is equipped with a motor-driven agitator, which is run five minutes before emptying the tank to give uniformity to the contents.

Motor truck transportation has cut into the business of British railways so severely that several lines contemplate running trucks themselves.

Last year was the driest European agriculture has known for a century or more.

Great reefs of copper, totaling 240 miles and averaging more than a foot in width, have been discovered in Morocco recently, according to Paris reports. More than 2,000,000 pounds of ore are exposed, yielding from eight to 10 per cent copper, which means 250,000 tons of the ore without sinking a single shaft.

An artificial stone, marble-like and with a glazed surface, is being made in England. The stone is colored in various hues to suit the maker.

The preservative powers of borax was first discovered by a prospector in Yellowstone Park, it is said. He came across the body of a horse, which, although it had died long before, was perfectly whole and preserved and covered with a layer of fine dust, which proved to be borax. He took advantage of his discovery and sold his secret to a packing firm.

More than 2,000,000 men and women in the United States past 50 years of age are unmarried.

Paper made from water lilies will be produced in a new factory in Ocotlan, Mexico. The lilies are of such a peculiarly fibrous nature that they form the best material for a high grade of paper and the supply is inexhaustible, because the lilies cover the rivers in that vicinity and grow rapidly.

State insurance against hail in North Dakota has proved a success.

It is said that the color of birds can be changed within five generations by keeping them in a white room, with surroundings of white and attended by persons attired in white.

"Jewish Influence on American Life," Volume III in the series on "The International Jew," comprises a third selection of articles on the Jewish Question, and is now off the press. It contains 256 pages, and will be sent for the cost of printing and mailing, which is 25 cents.

"The International Jew," Volume I, and "Jewish Activities in the United States," Volume II, 235 and 256 pages, sent for 25 cents each.

Hard coal is the one important commodity which did not drop a cent in price during the depression period, but has actually increased steadily.

Venetians have decreed that the old prison and palace of St. Mark's shall be converted to the needs of culture. The "Bridge of Sighs" over a canal connects the palace with the prison. The question of whether the palace will be made over into a popular concert hall or home of the famous Artistic Club of Venice has not been settled.

An oil well drilled in 1860 in Pennsylvania is still producing oil. It was recently drilled to the third sand and shot and is producing about 10 barrels daily.

Public dancing in cafés is not permitted in Vienna, except by special license, and then for only two hours at tea time. This is because of the effect descriptions of a revelous and laughing Vienna had on subscribers to foreign relief organizations feeding a few hundred thousand Austrian children.

Two young cedars of Lebanon, recently planted in the Brooklyn Botanic Gardens, are flourishing. Two other specimens may be seen in the Arnold Arboretum at Cambridge, Massachusetts.

A new calendar watch runs for eight days with one winding. It shows the days of the week and month, besides the hours, minutes and seconds.

Banana figs are dehydrated bananas, their water content being reduced to 20 per cent. The finished product is a rich golden yellow and of sticky, fig-like appearance. When properly packed they will keep their fine flavor for months if stored in well-ventilated cool and dry places.

Tourists spent approximately $35,000,000 in Colorado during 1921.

Necklaces of dogs' and wolves' teeth were among the relics of the early stone age reported to have been discovered recently in Westphalia, near Henglarn, Germany, by scientific investigators.

Defeating 25 graduates of high schools and colleges, a woman, 87 years old, won a spelling bee in Bucyrus, Ohio. The contest lasted more than three hours.

An oil depot is being built at Tahiti by the French to supply steamers plying between Vancouver, San Francisco, Australia and New Zealand and ships Europe-bound by way of the Panama Canal.

The village "jug" of Mansfield, Missouri, is really a jug. The little jail building is constructed of concrete, 16 inches thick and is the replica of the half of the old-time whisky bottle. The exterior is rounded, with a tapering of several feet at the entrance.

A turkey an acre is a novel farm rent fee in effect in South Dakota. A farmer near White Rock, South Dakota, has offered to rent his farm of 160 acres to a tenant on the sole condition that the tenant shall turn over to him one turkey for each acre of land in the farm.

Periodical rat hunts in Paris are conducted by an expert engineer using ferrets. Paris spent 300,000 francs last year in an endeavor to rid the city of the rodents.

Grafting a big toe to the stump of a thumb has been successfully performed by two French surgeons. A 15-year-old boy lost his thumb in a piece of gearing. His big toe was grafted in place of the thumb, and he is now able to grasp and hold, palm downward, a weight of more than two pounds. The new member is normal as far as muscular power is concerned. It also has the sense of touch and is sensitive to pain and cold, but is nonsensitive to heat.

Bubonic plague is spreading over the Queensland coast of Australia with the advance of the Australian summer. Infected rats are today spread over 1,000 miles of coast and the inhabitants are entering a period of danger, according to the Australian Medical Journal.

Some hitherto unknown minerals have been discovered among more than 200 different kinds of metal deposits in the interior mountains of the Kola Peninsula, which juts out into the Arctic Ocean and White Sea north of Murmansk and Archangel.

Chronicler of the Neglected Truth

"That's What We're Built on—Broken Homes!"

"Yellows" of American Journalism Vie With Films in Their Indecencies

REPORTERS for three daily newspapers, after a conference with the Federal district attorney, recently agreed to suppress the name of a young married woman who had left her home in a mid-western city to accompany a man. The woman, contrite, had returned. The husband had not learned of her act and there was every opportunity for the reconciliation so ardently sought by the young woman. Therefore the suppression of the "news."

The following day, the reportorial representative of the particular yellow that stands in that city for the most powerful aggregation of publications, daily, weekly and monthly, in the country, returned to the Federal district attorney's office.

"Don't ever ask me to hold out anything again," he told the Federal official. "I nearly lost my job."

"Why? Did your city editor understand the situation?"

"Oh, yes! he understood. He said that's what we're built on—broken homes."

By LEWIS HARPER

SOME years ago one of the leading newspaper publishers of the United States was passing through the La Salle street station in Chicago attended by one of the many who essayed to be his Boswell. The publisher like many other great men—and he is a man of conspicuous ability—likes to hear himself talk.

Many of his maxims pass current in scores of newspaper offices today as the sayings of a master craftsman—in others his utterances are the imperative hunches of the BOSS.

Pointing out the hurrying crowd around the station gates to his henchman, the publisher, fresh from his private car paid for by the pennies of similar throngs in many cities, inquired:

"What three things are all those people thinking about?"

"What?" echoed Boswell.

There followed an alliterative *bon 'mot* in three words which cannot yet—get the YET—be printed even in the publisher's own papers, but it has been repeated to hundreds of young men entering the newspaper game as the summary of news value—the unfailing and exclusive test of what subjects interest newspaper readers. That salacious epigram, this writer believes, has had no small part in starting the wave of indecency, which has tainted many newspapers and is tainting others.

The same thought variously, vigorously but always unprintably expressed, has flashed from the brains of many other masters in the newspaper game. How rapidly this tendency is now pervading the press is well illustrated by a collection of newspaper picture clippings lying on the desk upon which this is being written. Pasted on cardboard these cuttings from several of the larger newspapers—most of them Hearst publications but some of them out of the Hearst cycle—are only a wee bit removed from the pornographic picture post cards which are smuggled back from Paris by a certain type of tourist. Neither the pictures nor their suggestive titles and "cut lines" could have got by the police a few years ago. They are candidly libidinous, not esthetic, and if the photograph is not bald enough in its purpose, the headline or cut line reinforces it with some appropriate flippancy of a suggestive nature.

It is necessary to distinguish between the deliberate and salacious pandering of some newspapers today and the coarse frankness which marked earlier periods of American journalism. This distinction is comparable to the difference between the psychopathic treatment of sex in a modern story like "Erik Dorn" or the "Narrow House," and the crude, coarse but broad healthy outspokenness of Shakespeare and the other Elizabethans or the playful drollery of Rabelais. Neither is probably so desirable from the standpoint of racial welfare as the decencies and reticence which the Anglo-Saxon peoples had achieved in the nineteenth century—the period sneeringly referred to as "mid-Victorian" by alien-minded writing degenerates of today. The earlier expressiveness, however, had in it only the exaggerated exuberance of robust youth, none of the senility and morbid analysis of the decadents.

People Do Not Want Salacious "News"

THE worst that the older type of journalism ever attained—the exploitation of the nauseous details of the Thaw trials, was truthful reporting of actual facts, an abuse of frankness, but "straight news." The bulk of the sex stuff appearing in the newspapers today has no justification as "news" at all—it is deliberately fabricated, consisting either of "feature stories" painfully ferreted out or insignificant events grossly overplayed to exploit the prurient angle.

Many newspaper publishers and editors hold that vending sex suggestion is a paying business, that the road to circulation gains is paved with scandal. Precisely as the producers of the filthy motion picture justify themselves by declaring that the "public wants that sort of thing," do the masters of the newspapers declare that they are printing "what the people want."

They are mistaken. It can be shown that they are printing what they think the people want, because they like that sort of thing themselves.

The decline of the magazines in circulation, prosperity and prestige since they began the emotionalism debauch in the lurid era of Robert W. Chambers, and the later years of Richard Harding Davis, ought to be sufficient evidence.

Small-Town Papers Are Clean

THE people showed no desire for a scandalmonger press for something like a century after newspapers assumed an important rôle in American life. In a great many cities, and in most of the smaller towns today they voice no demand for scandal or pornographic newspaper "art" and they do not get it. The small-town press today is clean. Compare it with the movies exhibited in its own bailiwicks. The last few years have witnessed the maximum prosperity for the small-town newspapers.

Even in the larger cities the evidence that the people want sex instead of news is not conclusive. In every city where a filthy newspaper is published, it has one or more cleaner competitors which prosper. There are several cities in which the crazed newspaper is the also ran. Even the Hearst papers are not invariably profitable. Indeed, it has been reliably stated that the majority of them are "losers" financially. The real American people are not far removed from the pioneer stage, and with young nations sex is only a normal incident in lives filled with other activities. Our urban populations, despite the influx of hordes of aliens, have not as yet succumbed to the sex cults, which destroyed or thwarted civilization in ancient Alexandria, Greece and India. The whole subject of the social and historical significance of sex is yet in the pre-scientific stage, but what little we do know gives no warrant for the belief that the American people will ever succumb to cults.

Despite the current cant among the newer type of city editors and reporters the people still want straight news about serious topics. The aversion to the constructive or serious story so evident in many city rooms is a reflection not so much of reader taste as of the inability of the certain types of newspaper man to write anything except froth and intended humor of the piffling variety.

One reason feature stories got such a start some years ago was the inferior facilities for obtaining telegraph news by those papers which had no press service franchises. The editors were driven to play up local news. This meant that trifles were often magnified. The feature is essentially the outgrowth of the overplayed story, the result of seizing the peculiar twist or the odd angle of a human situation for newspaper exploitation. Although this cause has long since ceased to operate on many newspapers, the habit of playing up features to the exclusion of real news persists.

Hearst Leads Risque Picture Race

THE result is the production of many newspapers in America which, as far as giving an accurate idea of the world we live in is concerned, might as well be printed by 12-year-old children. Features at one time consisted largely of "sob" stories. Much of human crime and misfortune as well as humorous predicament is due to unbridled sex instinct. The descent of the sob squad to sex was easy. The sob sisters appointed to handle the Hamon case began with tears and graduated into lingerie. Some publishers frankly set out to print all the suggestive stuff they can find.

Hearst is usually regarded as the chief offender. He probably deserves this popular verdict. Certainly in the exploitation of risque pictures he leads them all and is still gaining, despite frantic pursuit by his competitors. His movie connections give him an advantage. He owes much to Mack Sennett. The bathing beauties broke down the outer barriers of pictorial decency in the newspapers. From the day they began to appear on the screen and in the screen advertising, the flock of half-clad beauties multiplied. The Chicago *Tribune* is partially and unwittingly responsible for the semi-nude ladies now appearing morning and evening on the news stands. Not that the *Tribune* leads in the race for decollete. Its pictures are somewhat tame. But when it founded the marvelously successful *Daily News* in New York and showed that there was a demand for pictures by the people, newspaper art sprang to new and vigorous life everywhere. To prevent the launching of similarly illustrated newspapers in their own cities, publishers everywhere began to print more pictures, to devote whole pages or tabloid sections to illustrations. The result can be seen in any city room where the make-up editor tears through the packages of new pictures like a French dog digging for truffles. He is hunting for dancers, bathing girls, swimmers or anything feminine that will show white and curved on a dark background.

The extent to which such "news" is engaging the attention of those who write news at the source may be gauged from an experiment conducted by the writer last year. If it were not for careful editing the proportion would be higher than it is, but on even the yellowest sheets care is taken to put some other stuff in the paper. They realize that there are limits even to "what the people want." Usually a newspaper is planned before the day's work has begun—after that the general scheme is varied as the news develops. One day in the summer of 1921 the writer discarded this plan and allowed all news to be printed as it came in—giving each story the headline called for by its length and cutting nothing. The paper was made up by picking up the stories in type, as the make-ups came to them, and lifting them into the paper. Regard was paid only to the typographical balance of the page. The run of the news made the paper—nothing was rejected, minimized or played up. First come, first printed, was the rule. It was a fair test of what sort of news the press associations, the local staff and the feature syndicates were supplying. It reflected the prevailing journalistic modes faithfully for that day at any rate. The result would have meant a riot a few years ago in a normal city of that size. There were 16 stories on the front page. Of these, 11 had a sex angle and sex was the sole theme of nine. The five not dealing with sex were none of them over two paragraphs in length. The whole top of the page blazed with the subject—three two-column leads, with two one-column tidbit sex features sandwiched in between them. The local staff, the telegraph desk and the mail features contributed about equally to this triumph of salacity. Our readers, however, were so used to that sort of thing that not a single indignant "vox pop" wrote a letter to the editor. A short while previous a picture of the hanging scene at Santa Rosa, California, where several assailants of girls had been lynched, had drawn a shower of indignant letters. It must be safer to incite sexual crime than to picture its result.

Straight News Almost Taboo Now

THE shibboleth in self-acclaimed "liberal" and "progressive" editorial rooms today is that the real function of a newspaper is to "entertain" the people—not to instruct them. Only the mossbacks still care for straight news. Even when old-fashioned news simply *has to be printed* it must be "jazzed," according to this school, and the writer of this analysis has jazzed it himself.

Strangely enough, much of the pollution of the newspapers has resulted from so-called uplift efforts and alleged moral reform. Many "exposure" stories are produced to get in the salacious details of the "horrible examples," not to eliminate the evils attacked. It has become increasingly difficult to draw the line between pruriency and purity. Most of the so-called white slave "exposés" written when the Mann Act was live news were highly seasoned fiction written for motives altogether foreign to their alleged purpose. There is a class of editors who dote on "vice crusades" and "moral clean-ups" because of the good sex copy they produce.

"Some of the people" do seem to want the exposure variety of sex stimulus—at least after having been educated up to it. At a typical "vice crusade" meeting in a western city last year one gray-haired man in the audience told the lady chairman that he was so intrigued by the morning paper's exposures of commercialized vice that he was getting up an hour earlier to read the details before breakfast.

Sex Story Plan Was Deliberate

IRRESPECTIVE of its deeper historical and psychological causes the modern phase of journalistic salacity originated in the desire of certain publishers about 1912 to obtain a substitute for political and industrial muck raking as a means of stimulating popular interest and circulation. The search for this substitute was cold blooded and sex was picked after careful consideration. Despite the minutely weighed premises on which this policy was based the writer believes that ultimately the publishers will learn they have made a tremendous mistake. American history shows that every man or set of men who has failed in faith in the American people has met with defeat or bankruptcy.

This conviction as to the bad guess of the protagonists of sex journalism is based on the fate which overtook the magazines. The monthlies and weeklies had reached the apex of their popularity, prestige and prosperity in 1912. Their enormous circulation had been gained by a course of fearless criticism of social and economic abuses, beginning with Tom Lawson's "Frenzied Finance" launched in the very heyday of Hannaism. Despite its exaggerations and malignant by-products the American people instinctively sensed

Ottawa, the Picturesque Capital of Canada

Seat of Government Surrounded by Historic Lore and Beauty

By D. M. LE BOURDAIS

THE capacity of a people to realize and appreciate the beautiful in art and nature is reflected in its cities. More, perhaps, than any other city should a country's capital typify the aims, aspirations and particular degree of culture of the people whose political center it is. For variety and grandeur, Canada's natural beauty is unsurpassed; and the Dominion's capital might therefore be expected to have its location amid the beauties of mountain, lake and stream. This is indeed the case.

Ottawa is a city with a population of about 100,000, splendidly situated on the south bank of the Ottawa River, about 110 miles west of Montreal and about 75 miles north of the St. Lawrence River at Brockville. The Ottawa River is the boundary between the provinces of Quebec and Ontario, the city of Ottawa being in the latter province. Parliament Hill, on which are grouped the legislative and administrative buildings, is a noble bluff rising 150 feet above the level of the river and commanding the city and surrounding country. From the top of the parliament buildings a beautiful panorama is presented. To the north, across the river, is the industrial city of Hull, Quebec, with a population

of 35,000. Here are located pulp and paper mills, sawmills and many other manufacturing concerns. Like Topsy, Hull "just growed," is without a single park, and presents a somewhat sordid appearance. Looking above and beyond the handiwork of man, however, the eye strikes the heavily wooded slopes of the Laurentian range, which form a beautiful background such as only nature unassisted can provide. Coming in from the north, about a mile eastward, tumbles the tempestuous Gatineau. A short distance farther east the Rideau River flows in from the south, dropping in silvery falls from the top of the steep cliff above. The early *voyageurs* saw in these falls a resemblance to a pair of flowing lawn curtains, hence the name.

Continuing eastward beyond the Rideau, standing in large natural grounds, is Rideau Hall, the residence of the Governor-General; and still farther beyond is Rockliffe Park following the bank of the river for a mile or more, a natural preserve of hill and forest.

Southward, the city stretches away for several miles on an undulating plain, broken by the devious course of the Rideau. The streets run parallel and at right angles to the river, thickly lined with great trees, principally maples and elms. Like a ribbon strung through the city runs the Rideau Canal to drop by a series of locks into the Ottawa River a short distance east of Parliament Hill. On the side of the canal opposite the parliament buildings is the beautiful Chateau Laurier, its early French Renaissance style of architecture harmonizing well with its surroundings. It was built in 1912 by the Grand Trunk Railway Company as a link in that company's chain of hotels; but with the transfer of the ownership of the Grand Trunk Railway to the people of Canada the hotel passed to them also. Behind the Chateau is Major's Hill Park; by a steel suspension bridge spanning a ravine down which has been built a roadway, access is obtained to another beautiful park comprising a bold promontory known as Nepean Point. Near the extremity and on the highest spot, facing appropriately westward, is erected a statue of Samuel de Champlain, the intrepid soldier, explorer and navigator, who ascended the Ottawa in 1613 and who in all probability would have chosen this point as a suitable spot from which to observe the course ahead, particularly as the roar of a mighty waterfall would have been audible to him for some distance down the river.

Turning to the westward, the mist and spray of the falls are visible, although greatly diminished since the days of Champlain by reason of a restraining dam and closely crowding power plants. The city also stretches out along the river for several miles westward. Looking farther west yet an island-studded lake, formed by an enlargement of the river, is seen.

Locks on the Rideau Canal at Ottawa. Major's Hill Park in the foreground at right; Nepean Point in right background.

Like Washington, Ottawa's selection was the result of compromise. The ancient capital of Canada—if the word "ancient" may with propriety be applied to anything in a country so young, historically, as Canada—was Quebec; and after the British conquest in 1763 the seat of government remained in that city. In 1791, however, the colony was divided into two provinces, Upper and Lower Canada, and, of course, each province had a capital of its own. Quebec continued to be the capital of Lower Canada and Toronto became the capital of Upper Canada. After the rebellion of 1837 the two provinces were reunited and a single capital again became necessary. Kingston, doubtless because of its proximity to the provincial border, was selected by the Governor-General. In the second session of the legislative assembly held in the new capital, however, a resolution was passed by an overwhelming majority protesting against the seat of government being continued at Kingston. Charles Dickens visited it in that year and gives a very unfavorable picture of Canada's capital at that time: "Indeed," he wrote, "it may be said of Kingston that one-half of it appears to be burned down, and the other half not built up." Opinion being apparently so unanimous on this point, it is not surprising that the capital was soon transferred to Montreal.

Montreal remained the seat of government from 1843 to 1849, but in the latter year a mob, as a means of expressing its disapproval of a certain measure that had passed the legislature, burned down the parliament buildings and attacked Lord Elgin, the Governor-General. After this, parliament met alternately for four-year periods at Quebec and Toronto. Obviously, a perambulatory capital must be but a temporary makeshift. It satisfied no one. Finally, in 1857, the legislature adopted an address requesting Queen Victoria to select a permanent site for the capital. The queen, of course, acted on the advice of her adviser, the Governor-General of Canada, Sir Edmund Head, who suggested Ottawa. This choice was almost as unpopular as was Kingston 17 years earlier. On July 28, 1858, the legislature passed a resolution: "That it is the opinion of this house that the city of Ottawa ought not to be the permanent seat of government for the province." One member of the assembly argued against the choice of Ottawa on the ground that "it was near the confines of civilization." The constituents of a district in Lower Canada memorialized their member to the effect that he "would most basely and shamefully sacrifice the interests of his constituents if he did not strive during the present session to make Montreal the seat of government." But wiser counsels prevailed and the choice of Ottawa was finally ratified by the assembly; although only by a very slim majority.

There was, however, in addition to the probably natural rivalry of larger and much more important cities, a certain amount of justification for a great deal of the opposition to the selection of Ottawa. At that time the best that could be said for Ottawa was that it was a more or less prosperous lumbering town of a few thousand inhabitants. And the critic who referred to it as being "near the confines of civilization" was not very far from the truth. Its undoubted natural beauty had been very largely ignored and in some cases even marred by the haphazard manner in which its streets had been laid out. The beauties with which nature has endowed Ottawa, however, have become more evident as the city becomes more worthy of the grandeur of its setting, and today there is a very general satisfaction throughout Canada with the selection of 1858.

Canada, too, has increased in size and importance since that date. In 1867 the British North American colonies took the first step toward nationhood. To Upper Canada (Ontario) and Lower Canada (Quebec) the maritime provinces of Nova Scotia and New Brunswick were added. In 1870 Manitoba entered confederation; in 1871 the Pacific province of British Columbia became part of the Dominion; and two years later the province of Prince Edward Island, lying in the Atlantic, also joined. In 1905 two new provinces were created out of what had been previously known as the Northwest Territories; and so today Ottawa is the capital city of the largest country, territorially, in the world, comprising nine provinces, but as yet consisting of less than 9,000,000 people.

In many ways it was fitting that the capital of Canada should be built on the banks of the historic Ottawa River. Almost every inch of it is associated in an intimate manner with some incident of note in early Canadian history. Along its course the Algon-

Too Much to Ask?

HERE'S hoping for a silent political campaign this year! It's the off year and the great political parties should rehearse for 1924 by trying out a congressional campaign devoid of political buncombe.

The United States has suffered bravely under a century and more of written and spoken politics. In the early years of the nineteenth century, political speakers in America gave such exhibitions of oracular eagle-screaming that they sent Charles Dickens back to write the bitter caricature, Martin Chuzzlewit, which has colored the British viewpoint on this country until today. Subsequent to the Civil War, came the crop of soldier statesmen whose stentorian platitudes echoed from the rafters for 30 years.

The Rooseveltian era brought a brief period of concreteness to political utterances, and during the last few years the empty-seat handicap has had a bear influence on the platform oratory industry. But there has been a vast increase in written buncombe.

Millions of dollars were spent in 1920 in showering upon the defenseless public tons of canned propaganda.

No person with a grain of sense believes that this great volume of print paper affects seriously one per cent of the vote. There are scores upon scores of influences that affect electors' actions. Hard times, creed, color, ancestry, gossip, war records, personality of candidates—occasionally the publicly proclaimed campaign issue—all combine in swaying the individual elector's judgment when he or she is alone in the election booth. Many of these influences are improper, un-American; but they are influences just the same.

But among all, the canned propaganda has the least effect. Whatever it may say, to whomsoever it may be addressed, the chances are great that the only judgment it will have a chance to prejudice is that of the janitor as he empties the waste basket.

As long as there are those among us who like to hear their own voices—and there is no race suicide among such people—it is to be feared that politics will be a source of continuous propaganda.

But there is no harm in hoping anyhow. So, once again:

Here's to a bunk-less campaign.

Good News from Monte Carlo

DISPATCHES from Monte Carlo to the daily press summarize the results of the searching investigation being made into immigration by America's special high commissioner on immigration, Lillian Russell.

Miss Russell is our ablest former actress now engaged in solving the immigration problem for the President and Congress. The press dispatches announce that Miss Russell participated enthusiastically in the carnival at Nice. Her inquiries concluded, she moved on down the Mediterranean shores to the principality of Monaco, where she continued her studies.

State and labor department higher-ups have not disclosed the reason of the lady commissioner's close attention to affairs in Monaco. It is presumed, however, that Miss Russell is formulating a system whereby the American poker-player may avert the menace of a sudden onslaught of Monaco' immigrants, carrying roulette wheels.

The press dispatches say that Miss Russell thinks it too bad that wicked passport brokers have fooled prospective immigrants with the claim that they can show them how to dodge the American laws. She pictures movingly the deep disappointment of these defectives on reaching Ellis Island to learn that their careful schooling in violating American law has been a failure.

Miss Russell is determined to continue vigorously in her work of solving the immigration problem. By the time the winter is over, she may have the entire Riviera problem solved. Later in the season there will be Ostend, Dieppe, Maisons-Lafitte, and other places where the foreigner question will have to be considered.

Miss Russell wore a princess model of Duchess satin with Valenciennes lace and carried white spray orchids while solving the Monaco problem.

Very Free Verse

IT WOULD be interesting to know the criteria by which the *Nation's* poetry prize this year was awarded to Martin Feinstein. By any ordinary canons of criticism, the lines which so audaciously bear the name of Tennyson's immortal epic could not be included in literature at all, to say nothing of "poetry."

If the line is to be drawn between literature and clinical reports or pathological analyses, surely it must be drawn at the Feinstein effort.

Feinstein's "In Memoriam" is an attempt to bespatter with trench filth a name sacred to the great majority of the people of America. No least sense of shame seems to restrain a strange blasphemous impulse to misuse of the name of the Founder of the Christian Faith. Here is a recurring refrain:

Eh-oh, my brother Jesus,
They rigged you up in state,
In a khaki coat and a gun to tote,
Did they think you could learn to hate?

He goes on to identify Jesus with "a guy" discovered to be dead. Whereupon it is conjectured:

Or maybe he wasn't Jesus at all,
But a thief or a pimp in a dancing hall.

As we are told that the prize-winner is a graduate of the University of Michigan, where he taught rhetoric for three years, and is now on the staff of the Jewish *Menorah Journal* to which he has contributed verse, this singular offensiveness is not to be attributed to any lack of literary skill and training. Indeed, in several of the quatrains he betrays touches of rare delicacy and the poem as a whole would be an impressive protest against war's sordidness and horror, but for the inexcusable interpolations cited.

Renewing Our Debts

ONE thing that stands out in the latest annual report of the Secretary of the Treasury is that the present administration is committed to the policy of refunding, rather than paying, the unbonded public debt as these obligations mature. It is a policy irresistibly suggestive of Mr. Wilkins Micawber paying one note by giving another and thanking God that the debt was paid!

While Mr. Mellon's advocacy or opposition to this or that measure of taxation is important, it is not conclusive. Congress and the people have the last say in regard to tax measures. It is otherwise with the present Treasury policy of rediscounting, instead of paying, the short-term public debt as it becomes due. In this matter, the Secretary has authority to act without consulting Congress, and he is acting straight ahead day by day.

All the more reason that public opinion should be informed of what is going on. Since the war started, and up to October 31, 1921, the United States Treasury has issued $51,327,777,903 in short-term obligations of one sort or another. The total is a staggering one, but it is verified by official data. It is to be taken into account, however, that most of this total has gone into renewals or new securities to take the place of maturing unbonded debt. Instead of paying off these temporary loans, the Treasury borrowed again and again. Its method has been that of the man having a 60-day note at the bank and who instead of paying it when it becomes due renews, that is, rediscounts it, and keeps up that process indefinitely. As every business man knows, it is a very extravagant way of financing any business. In the case of a great and wealthy government, there is even less excuse for it than in that of the small or large merchant.

At the close of the fiscal year, ending June 30, 1921, a total of about seven and a half billion dollars (in a total of $24,000,000,000 in round numbers) of public debt was represented in short-term obligations that might be likened to the merchant's 60-day notes at the bank. We are constantly renewing at heavy cost our unbonded debt as it becomes due. At present the interest charges cost the taxpayers more than a billion dollars a year—a sum equal to the total budget a few years ago. If even one-half the floating debt that will mature and should be paid in the next 30 months were included in the budget for the coming year, it would total nearly seven billion dollars. That may be one reason for sliding it along into the future. Then again, the marketing of these short-term Treasury Certificates of Indebtedness is very profitable for the big banks. That may be another reason.

Mr. Mann States the Case

REPRESENTATIVE JAMES R. MANN, of Illinois, probably bites the coins returned to him in change. Then he doubtless lets them fall on the counter to determine whether they ring true.

At least he manifests in Congress a most complete disrespect for the political amenities that require our governmental institutions and imposing personalities to be looked up to with profound reverence. Nothing is better settled in American life than that the utterances and deeds, self-accredited to particular personages, are actually the products of their brains and brawn. It would be *lese majeste* to suggest that some obscure $60-a-month clerk in a government department actually worked out changes, whereby the department head was able modestly to confess credit to the general public for saving the people millions.

But Representative Mann seems to have rubbed against surrounding officialdom so much that he has rubbed all the glitter off.

Congress was considering a bill for the exchange between the Federal Government and New York City of sites for a post office and a courthouse. A high-sounding amendment provided that the Secretary of the Treasury, the Attorney-General, the Postmaster-General, the Secretary of Commerce and the Secretary of Labor, be named as a commission to confer and examine and arrange for the exchange.

"Not one of these cabinet members will ever look at these sites," glumly suggested Mr. Mann, "unless they want a nice trip over to New York, which they can get anyhow. It will be a subordinate official who recommends the change. If I thought the five Cabinet members were to serve on such a commission, I would be against the bill; they have something better to do."

Another representative pointed out that the fact there were five cabinet officers members of the commission instead of three was the result of the Postmaster-General's own suggestion.

"Oh," continued the iconoclastic Mr. Mann, "the Postmaster-General has not been worth a five-cent piece since he has been Postmaster-General. He does not know anything about the Post Office Department; and for one, I am mighty glad he is getting out of it. His only object has been to be extravagant in his own personal relations with the government. Long-distance telephoning is his main long suit. I am only speaking of his official duties. I can say this, having no postmaster to be appointed."

The Practice of Law

WHEN the leader of the American bar argues with forceful logic, and when the holder of the foremost judicial position in American life gives utterance to his profound opinion, the nation gives respectful attention.

Elihu Root and William Howard Taft, appearing before the American Bar Association, contended that to uphold the standards of the legal profession, more rigid requirements for admission to the bar should be enforced. The two learned gentlemen pointed out that the profession had been flooded during recent years with a horde of undesirable, commercially-inclined individuals, little above the grade of shysters, who were lowering the plane of justice and honesty, established by early American jurists and lawyers.

They suggested as a cure for this condition, the requirement of from two to four years of college or university training, prior to a three or four-year course in law school.

The reasoning with which the distinguished lawyers argue their case is almost unanswerable. Unfortunately for their contention, however, American law is not a matter of present-day logic. Law is interpreted according to judicial precedent. And when we consult the authorities on the question of the college courses necessary for proper training for the law as a profession, we are confronted immediately by the cases of Abraham Lincoln, Henry Clay, William Wirt, Patrick Henry, Thomas E. Cooley, John Marshall and others of similar purport. While these cases are not authority for the assumption that a college literary course is not advantageous, they would seem to dispose of the contention that absence of it should deprive a person of any hope to realize an ambition for the law.

It would seem wise to deny the request of Mr. Root and the learned Chief Justice. This denial will, of course, be without prejudice to their privilege to appear again before the court of public opinion with legal and practicable suggestions for raising the plane of the law and other professions and businesses by surrounding American citizenship with safeguards which will halt the encroachments of those alien elements which threaten it.

Mr. Ford's Page

WHAT portion of progress is due to effort, and what portion to the pressure of destiny, no one can say. It is certain, however, that not all progress is due to conscious effort, whatever the impudent philosophy of the times may say to the contrary. There is a mixture of the two forces; it may be that there is a coincidence of human effort and destiny, so that when the universe begins to urge, man begins to will. Certainly progress cannot be forced upon those who are unable to receive it, and it is equally certain that mankind is not wise enough to know in what direction progress ought to be made. There is a mixture of exterior guidance and interior desire. In the midst of an age that has witnessed the most incomprehensible changes in human conditions, only a certain racial element in the world has been able to feel and follow the urgings of destiny: that is another fact.

It is not necessary, however, to chart the whole wide sweep of destiny before we can become able to understand certain matters near at hand. In our own affairs, in our own time, it must be clear to us that progress rarely comes of the adventurous will of man—taking mankind in the mass—but as the result of some kind of outward pressure. Men are pushed ahead oftener than they go ahead of their own will—that is, mankind in the mass.

The pressure may sometimes be due to the appearance of a new personality with a new idea, or it may be due to a combination of circumstances too big for any person to cause or control. An illustration of the first may be found in the inventor who throws a new idea into the midst of society, forcing society to reorganize certain activities around that invention as a high point. That has happened several times in the lives of men still in middle age.

But the other pressure—that generated by circumstance—is the clearer illustration of the dependence of progress on outside influences.

Take the political and economic condition of the country today. No one can say, with any conviction in his voice or his heart, that the present condition is irremediable. No one can pretend to say with wisdom that there is nothing to do but wait. But every one knows in his mind and in his heart—that is, by both his thoughtful mind and his instinct—that none of the old remedies will work the cure. And every one knows just as surely that the old remedies will be dropped only under compulsion.

Well, there will undoubtedly be compulsion. Not the mistimed compulsion of revolutionary violence, nor the impatient imbecility of illiterate usurpation, but the compulsion of events. When old-era men attempt to grapple with new-era problems, something inevitably happens. Instead of the men solving the problems, the problems dissolve the men.

It is probably necessary that this process should appear between the old era and the new, because it has a preparatory value. The tree never easily lets go its leaves until the old leaves cease to serve and the new leaves begin to press in. Society holds hard to the old until the pressure of the new pushes it off.

What we shall witness now will be the public discrediting of old-era minds and old-era measures, not because of ill-will but because of their inability to accomplish the things that must be done before the country can move forward. We are in a quiet time before two seasons. There is no excitement, no bated hush of tense expectancy—the people feel that the words, words, words, and the pose, and the make-believe, and the soothing sirups of oratory, promise and legislation are now utterly useless; and they simply wait without rancor, without bitterness until the old political practitioners find it out.

The people are wise with a wisdom that does not early find its way into words. And the people know better than to blame the men in office. They know that the men in office would do the deed if they could—would do it only because it would be "good politics," if for no other reason, but they also know that the men in office cannot act because they do not know how.

Formerly the people were angered at incompetency in office, at the discrepancy between promise and performance. They are angry no longer. They know now that it is not because the men in office *will* not, but because they *cannot,* however hard they may try. The old-era knowledge is not wide enough to reach round the new-era tasks.

To know that we have come to the end of our resources within a given circle, is to know something worth while. If the old circle is barren, nothing is left but to break into a newer and wider circle, and that is exactly what will occur under the pressure of the circumstances which are now piling upon us. Responsible officials are waiting for something to happen, praying for some issue to turn up, that will give them a cue how to act. But there will be no such luck. The old system is going out of business; there is no cure but the wisdom to welcome the new era, which will not alone solve our present problems but abolish them utterly. No people in our stage of development has any right to have the kind of problems that we have! They don't belong to civilized mankind.

WE SHALL not make any progress by trying to solve New Era Problems with Old Era Men or Methods. The people know this by instinct. That is why they expect so little from the rulers of the country. Formerly the people could charge corruption as the cause of political inefficiency; but now they know it is only sheer incompetency. Our officials would do better if they only knew how, but they belong to the old era and they don't know —they will not learn that old things have passed away, and they have not the understanding to fall in with the new. But the people know that new men will come to fit the new time. Then our present problems will not only be solved, but abolished.

It was very nice to be a politician and officeholder fifty, or even twenty, years ago, when so much could be done by a deft speech or a skillful bit of legislation. Those were the good old days when legal enactment could soothe almost any hurt. But that day is past. The political day is past. The day of speeches on the stump and bills in the legislature is past. *Because,* the circle in which these charms worked has fulfilled its destiny. A new and wider circle waits.

The tragedy of present-day politics is that, with the most desperate need of party salvation on all sides, the party men cannot see what they must do to be saved. And could they see it they would not do it. The old era has them in too fast a grip, and all the powers that are to collapse with its passing.

That is where the pressure of destiny will come in. This state of things will continue. The rulers will become more and more bewildered by their incompetence. The so-called masters of finance and economics will try all their erstwhile fruitful tricks in vain. There will be conferences on this and that, and agreements to this and that, and great trumpet announcements of this and that, but nothing will move. We have just had a great peace conference—two of them, in fact, and there has been great hurrah, but not a single voice brave enough to propose to make profit impossible in war. Not a single voice hardy enough to attack the only modern cause for war between civilized nations!

But circumstances will steadily press. Men and measures will give up and disappear. And then, silently out of the long preparation of obscurity, the new era will come—doing the very things the present rulers say is impossible. Money fictions upset; political bogies brushed away; economic tangles found to be very simple knots demanding a little honesty and a little humanity for their untying. And it will be done.

The people who will do it are here. The vast majority of plain people are new-era folks. They know already that the old way is forever finished. The soil for the new time comprises practically all of the people. The last act is being given on the governmental stage, where in the sight of heaven and earth the old era is being tried and condemned on the simple charge of incompetency.

Lost Pages of American History Are Found

Old Diaries Reveal How Adventurers Found and Lost California

By HARRY H. DUNN

NOT all the romances of the world are in books. The greatest of them, since the days when the Aryans brought the first copper kettles out of Asia, were written with swords, whose hilts, by the way, were fashioned after the Cross, on the human parchment of the lands of sunshine of the New World. Of many of these, indeed, of some of the most important, there is not now, and probably never has been, any written record, yet each of them is a letter, a figure, a symbol of some kind in the sentence that explains just why Spain made such a success in the New World, and by just what means the Maya, Nahua, Yuma and other Indian empires and kingdoms fell before the advance of expeditions whose white members could be counted on the fingers of a man's hands.

The tales of the master adventurers, such as Cortez, Balboa, Ponce de Leon, Narvaez, or the Pizarro brothers, are told in every language under the sun, but ever and anon there comes to the light the magic tale of another adventurer, riding beneath the banners of Castile and Aragon into a hitherto untold romance. Read, for instance, that it was Ortega, the sergeant, and not Portola, the commander, who in reality was the first to see San Francisco Bay; and that it was the advice of Malintze, the Indian light-'o-love, rather than that of Cristobal de Olid or Pedro de Alvarado, which enabled Hernando Cortez to overcome the Nahua Empire. Just recently, another of these romances of the most romantic days of American history was unearthed in the cobwebbed files of an ancient library in Mexico, by an American historian, a romance which is of the greatest interest to Americans, because it binds into the volume of American history the records of four years which had been, to all intents and purposes, lost. It is of still further interest because it reveals one of the reasons for the loss to Spain of the great and rich borderland on the Pacific, now known as California. It consists of the diaries of Juan Bautista de Anza, the first white man to enter California from the eastern side, the first to lead an expedition across the Colorado desert, and the first of the *conquistadores* to cross the wall of the Sierras into the garden lands of Southern California.

Out from the Spanish presidio of Tubac, south of Tucson, Arizona, then a part of Mexico, came Lieutenant-Colonel Anza, in 1774, bound on the mission of finding a way to the Spanish presidio at Monterey, California. Making his way to the coast of the Pacific —then called "The Philippine Ocean"—Anza returned, and, in 1776, starting this time from Horcasitas, in the state of Sonora, Mexico, once more braved the "mysterious land of the giants," as the unknown desert was called, and led a party of colonists into California. From these colonists, and from the soldiers who accompanied them, sprang some of the proudest families of early days in California. Not a few of the towns of the California of today still bear the names of the families these colonists and men-at-arms from distant Horcasitas founded out on the shores of the Sunset Sea.

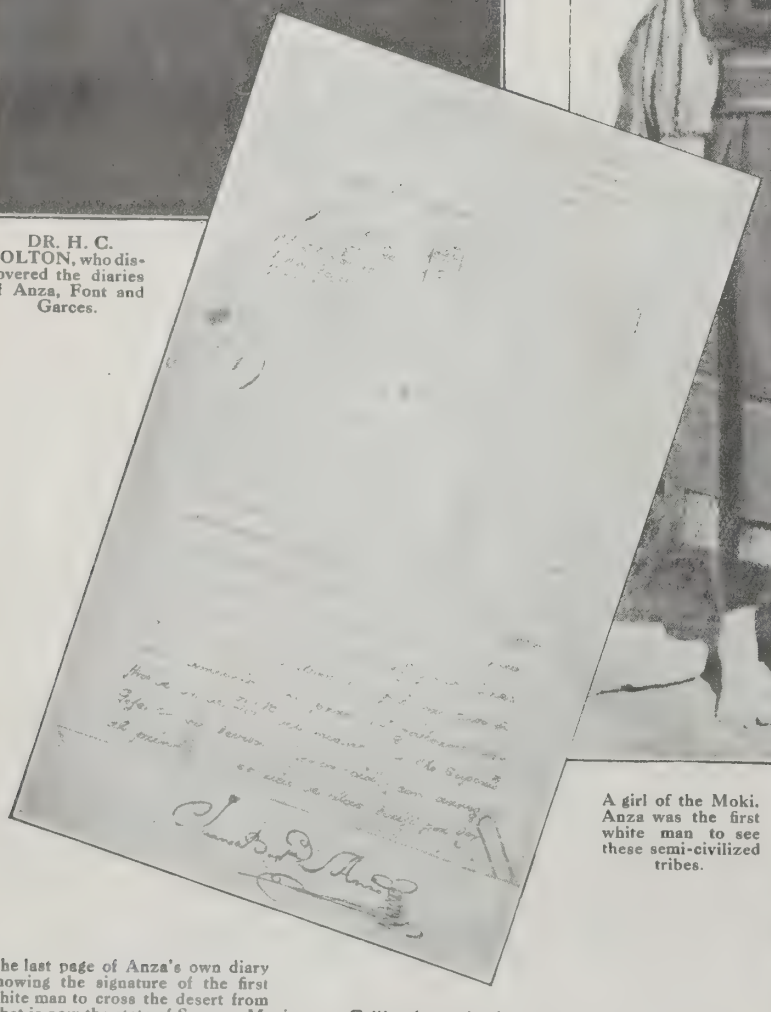
One of these diaries was written by Anza himself. It pertains more to the financing, the mounting, the feeding, the clothing, the arming, and similar details of the expeditions. Other diaries, written by the *padres* who accompanied the expeditions, Font and Garces by name, tell more of the details of the marches, the character of the lands visited for the first time by white men, and the Indians, from the Yumas, and their great chief Ollyquotequieba, whom the Spaniards rechristened "Salvador Palma," to the christianized natives at the coastal missions. Seldom have more interesting or more valuable historical documents been found; certainly no historical discovery of recent years is of more importance than this, for, during the period of Spanish occupation and extension of which these diaries tell, the young United States was restricted to the country east of the Mississippi River, and had no means of knowing of the important movements going on in the remote Southwest.

The man who has done the most to unearth these lost pages of American history is Dr. Herbert E. Bolton, head of the department of history at the University of California, and the foremost authority in the United States on the history of the Southwest under Spanish domination—the "tale of the Spanish borderlands," as he poetically calls it. For a number of years Dr. Bolton has been delving in the myriad records of the sixteenth, seventeenth and early eighteenth centuries, buried in the unexplored *bibliotecas* of the larger Mexican cities, such as Guadalajara, San Luis Potosi, Mexico City, and even that storm-center of early military action in Mexico, Queretaro. He it was, also, who found the long-lost autobiography of Father Kino, founder of many Jesuit missions in the Southwest, a memoir which some historians went so far as to say never had been written, yet which proved, when Dr. Bolton found and translated it, to be one of the most thrilling of all the hidden romances and tales of adventure in the entire book of Spanish domination in the New World.

Not satisfied, however, with merely finding the diaries of Anza and his priests, Dr. Bolton is now engaged in "back-tracking" the Spanish explorer, from the point at which Anza set up the cross and founded the city of San Francisco, to his starting points at Tubac and Horcasitas. Taking as companions W. C. Paden, Jr., and Dr. C. W. Neff, the California historian has followed this trail, locating its exact route, finding and using the camping places where the Spaniard stopped, traveling through the mountain passes by which Anza entered California, and photographing points of identification and of interest. At the end of the 1921 vacation, when he had to return to the University of California to take charge of his classes, Dr. Bolton had carried the trail of the *conquistador* back as far as the western rim of the Imperial Valley. This summer, they plan to follow it across the desert, down into old Mexico, back up into the United States, across the Colorado at Yuma, the point at which Anza crossed the stream, and on down to the end of the quest at Horcasitas.

Reconstructing the trail of an explorer and marking it, much as one might mark an automobile road, seems a new method of establishing the accuracy of written history, and one of value, for already Dr. Bolton has found many errors in the beliefs held as to the route followed by Anza and his diary-writing *padres*. One of these errors is the statement widely advertised by a certain railroad that its tracks follow the Anza trail through San Gorgonio Pass in the Southern California mountains. As a matter of fact, Anza never saw San Gorgonio Pass, but entered Southern California through another gap. His exact route from the Mexican border, according to the diaries, was along the eastern foothills of the Sierras to Borrego Valley, up Coyote Canyon to the junction of Horse, Tule and Nance canyons. "From this point," says Dr. Bolton, "Anza climbed the steep ridge which separates Tule from Nance Canyon, traversed its entire length of five or six miles, and emerged at the head of Nance Canyon, through a pass which he named San Carlos. The pass now opens into the horse corral of Fred Clark, a mountain rancher, who lives on the historic trail. In the rocks above this gap, smoke-walled cliff dwellings are still to be seen.

"Anza then crossed the plateau, a distance of 15 or 20 miles, and then descended Bautista Canyon and camped on the San Jacinto River, near the present town bearing the same name. Thence he passed on through the San Jacinto Valley to the present site of the city of Riverside, near which he crossed the Santa Ana River, and thereafter made his way to the mission of San Gabriel, a few miles from the present city of Los Angeles. From there, the expeditions followed the known route used by the *padres* and the Spanish soldiers to the presidio of Monterey."



When Dr. Bolton and his associates have completed their "back-tracking" of the long-gone Juan Bautista de Anza, they will carry the matter of the trail to the head organization of the Native Sons of the Golden West, which plans to set up monuments along the famous path, which, for some distance through the

DR. H. C. BOLTON, who discovered the diaries of Anza, Font and Garces.

A girl of the Moki. Anza was the first white man to see these semi-civilized tribes.

The last page of Anza's own diary showing the signature of the first white man to cross the desert from what is now the state of Sonora, Mexico, to California, and who was the founder of San Francisco—Juan Bautista de Anza.

Drs. Bolton and Paden and their pack animals "back-tracking" Anza across the desert.

mountains, follows an Indian trail hundreds, if not thousands, of years old. Among the many other interesting revelations made by these diaries is that showing the action, or rather lack of action, which contributed to the ultimate loss of California by Spain. When Anza penetrated Pimeria, as all the country north and west of his starting place at Tubac was called, he encountered, along the east bank of the Colorado River, the powerful tribe of Indians known as the Yumas, gathered into a sort of kingdom, under the chief, who, as has been said, was named Palma, by the Spaniards, owing to their inability to pronounce his name in the language of the Yumas. This Palma led his people into strong friendship with the white men, furnishing them with food, guiding them to fords in the river, showing them the way to the waterholes in the desert, and sending Indian hunters as guides with them as far as the territory of the Cajuenches, a tribe dwelling further to the west.

In return for these favors, Palma asked that the Spaniards, on their return to Tubac, send priests to establish missions in the territory of the Yumas, so that the Indians might be taught the arts of building and agriculture. Anza promised to do this, and kept his promise, but his superiors in Mexico delayed action on his recommendations, until, when the missions finally were established on the Rio Colorado, the Yumas had tired of waiting, set upon the priests and killed them and wrecked the buildings.

"If we do not keep our word with these Indians, who are now our friends," wrote Anza to Mexico City, "they will turn against us and will prevent our keeping open the land route to California."

Anza's words seem to have been inspired by a considerable degree of foresight, for the Yumas under Palma did rise and did close the land route to California, thereby leaving to Spain only the long, uncertain and dangerous sea route from the ports on the west coast of Mexico to San Diego, Monterey and San Francisco. This virtually cut off California from the seat of Spanish government in the New World, in Mexico City, and allowed the Pacific Coast borderland to fall to whatever other government cared to take it. As a consequence, too, California, in Spanish days, never acquired more than a slender and scattered population. Once closed to Spain with Anza's last passage over it, this land route was never reopened; indeed, it is not improbable that Dr. Bolton and his companions are the first who have traversed all of the Anza trail since that doughty warrior of old Spain followed it back to Horcasitas a century and a half ago.

Thrilling as was Anza's first march across the "mysterious land of the giants," over the Sierras and down to the shore of the Pacific, his second trip, at the head of the colonists who were to hold Yerba Buena (now San Francisco) and establish there a city, is made even more interesting by the greater wealth of detail which Padre Font puts into his account of it. This second expedition, according to Dr. Bolton's translation, consisted of 240 persons and 1,055 animals. Officers of the expedition were Lieutenant-Colonel Juan Bautista de Anza, commander; Padre Pedro Font, chaplain; Padre Francisco Garces and Padre Tomas Eixarch, aides to Padre Font; Mariano Vidal, purveyor; Josef Joachim Moraga, lieutenant, and second in command; 18 veteran soldiers for escort duty; 20 recruits for the Monterey garrison; 29 wives of soldiers; 136 children; four volunteer settlers and their families; 20 muleteers, three *vaqueros* (cowboys); four servants, and three Indian interpreters. Last, but not least, as told in the diary, came also one widow, "traveling of her own account and at her own expense." She created more excitement on the trip than all the remainder of the party combined, not even the four children born on the journey being worth so much space, in the opinion of the good Padre Font, as this flashing-eyed relict of some Spaniard of Horcasitas. Just what became of the dashing widow is not stated, but as the fate of those who perished on the way is told in detail, it is to be inferred that she reached California, and continued to be the life of the party there, as on the 1,200-mile journey.

The party traveled in military order, like a small army on the march, and Padre Font describes the start and some of the progress as follows:

"At a suitable hour the horses and mules were brought up and each person went out to take his animals, the muleteers the mules, and the soldiers and servants the horses for themselves and their families. While they packed and saddled, I usually said mass, as there was sufficient time for that. When the animals were ready to start, the commander said, 'Mount'! We all mounted our horses, and the march began, the line being formed in this manner:

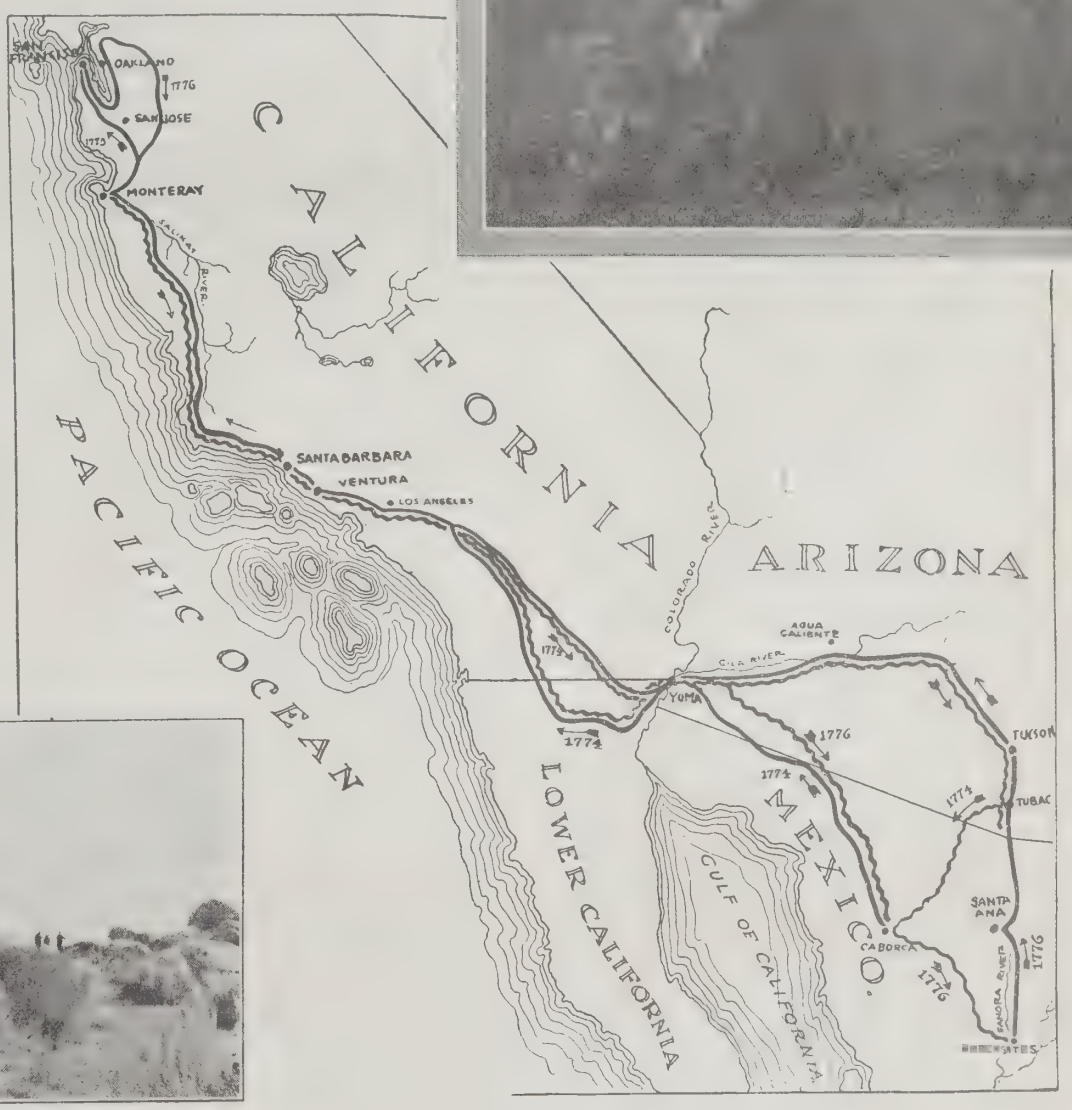
"In front went four soldiers to spy out the road. The commander followed, at the head of the vanguard. Then I came. After me followed the men, women and children, with the soldiers who went to escort and take care of their families. Then came the rear guard and the lieutenant. Behind, generally, came the pack animals, and after them the loose horses and last of all the cattle, altogether forming a very long line.

"As soon as we began the march, I intoned the 'Alabado,' and all the people responded. This was done on every day of the march. As soon as the halting place was reached, after all the people had alighted, the lieutenant went to report to the commander whether all had arrived, or whether anything had been left behind, so that he might order what was to be done. At night, the people recited the 'Rosary' in their huts by families, and at the end sang the 'Alabado,' or the 'Salve,' or something else, each family in its own way producing in this variety a very pleasing effect.

"As there was a very large number of people, when we halted, the camp resembled a town, with the huts made by the soldiers with their cloaks, blankets and branches of trees, and especially with the field tents, of which there were 13—nine for the soldiers, one for the lieutenant, one for Fathers Garces and Tomas, one for me, and one large round tent for the commander."

Shortly after leaving the Colorado River and striking out into the desert, it was found that the water holes were so few, so far apart, and carried such an inadequate amount of water, that it was necessary to divide the party into three groups, so that all might not arrive simultaneously at one water hole, but should reach it at such intervals that there would be time between arrivals for the holes to refill with water. In some places, Anza had wells dug, and Dr. Bolton and his companions found two or three of these still furnishing water.

The modern explorers, "back-trailing" the eighteenth century adventurer, found springs which are mentioned in the diaries, and at one of them a willow tree growing in exactly the same location with respect to the spring as a similar tree of the same variety, which grew on the same spot when the Anza expeditions stopped at the spring. That this is not the same willow, however, is proved by a passage in Padre Font's diary, which records that he, being ahead of the commander a distance of two or three leagues, "carved a message concerning some hostile Indians," for Anza to read, "on the trunk of a willow, which we peeled for the purpose of giving us a white space on which to carve the message of warning." Such a carving would have raised a welt or scar of some sort on the tree, but no such scar exists on the willow of today, though the spring is still there, also a small Indian village near it.



Anza's line of march, as determined by Dr. Bolton, after the expedition had left the Pimeria and entered the Papagueria—namely, the land of the Papagos—when it crossed the Altar River in Sonora, Mexico, at the mission of Caborca, January 22, was as follows:

Entering the United States, the route leads from the junction of the Gila and Colorado rivers, south into Mexico again, to round a long, low range of moving sand hills, westward of what is now the Imperial Valley, and then on through the mountains as previously described. Anza reached the junction of the Gila and the Colorado, on February 7, 1774, on his first trip into the unknown desert. He found the Colorado River only three and one-half feet deep, but 570 feet wide. He notes that at what is now Yuma, Arizona, stood an Indian *rancheria* (village). This had been named San Dionision by Father Kino, who visited this place in 1701, but then turned southward into Mexico, and so did not enter what is now California. Anza notes the great gorge of the Colorado River, "coming out of the purple mountains," and names several peaks, now well known to travelers on transcontinental railroads. The Yumas aided him materially, and showed him every kindness. He estimates these Indians as numbering 3,500, with fertile, well-cultivated farms, on which they grew corn, wheat, beans, squashes and melons.

Anza pressed on to San Francisco Bay where he planted a large wooden cross on the point of land which projected out into the Golden Gate from the south. This point he named Punta del Cantil Blanco—Point of the Steep White Rock—but it is now known as Fort Point. There, on the summit of a small plateau overlooking the Pacific and the largest landlocked harbor in the world, Juan Bautista de Anza accomplished the first half of the objective of his 1,200-mile march, when he decreed, in the name of the king of Spain, a settlement and a colony. Later, he was to accomplish the other half of his objective by bringing safely to the Punta del Cantil Blanco the colonists who were to make of this an outpost of Old Spain. Though this became one of the most important, it was by no means the most northerly of the Spanish colonies in the New World, since—though it is not generally known—the Spaniards had an interesting colonial history in what is now British Columbia. But that is another story, also one of Dr. Bolton's searching out, in all its details.

Still other lost pages of history were revealed the past year, when the private papers of Edward M. Kern, containing some of the official documents of Fort Sutter, California, were offered for sale in New York, and eventually purchased by Henry E. Huntington, for $8,400. In these papers are some of the official records of the events which transpired at Fort Sutter during the Bear Flag Revolt, the taking over of California by the Americans, and the fourth Fremont expedition to the Pacific Coast. These documents, some of which were written in 1846 and 1847, disappeared in the mountains of New Mexico, within a year after they were written, according to the man who offered them for sale. Neither the documents themselves, nor Mr. Kern's related papers, reveal when or where they were discovered. Kern was an artist with Fremont's expedition, and, later, was appointed by Fremont to the command of Fort Sutter. One of the important papers in the collection is the original official order of Commodore Sloat raising the American flag and taking possession of California in the name of the United States of America.

Bolton, Paden and Neff standing on the exact spot from which Anza, passing through the drouth of the desert and the snows and storms of the mountains, first beheld the sunshine and greenery of Southern California. The path they are on is an Indian trail hundreds of years old.

The "Money Mystery" Baffles the Government

"Gold Fiction" by Politicians Dependent on Financiers for Monetary Counsel

By A. R. PINCI

THE National Monetary Commission was the last of many sporadic attempts made by the Government of the United States to investigate the mystery of money and its related problems.

Mystery is the right word to use, because politically at Washington the exact nature of money's functions is unknown.

Either from the standpoint of an administration or that of the average Congress, the aggregate knowledge about finance, banking and currency is no greater than that of the great majority of their respective constituent members. Reducing this to a common opinion, as far as this is possible, *it can be safely stated that no matter how high the office, its holder is content to accept the common and current idea about money.* He has no intention to delve into theories of his own, to seek out the history, to separate the true from the false genesis.

Occasionally there appears upon the governing horizon an individual who is recognized as an expert. More probably than not he forces this recognition, an easy thing to do, with almost blind assurance that there is no one foolish enough to dispute whatever contentions are thus advanced. The only measure by which the latter is tested is the reaction upon public opinion, a very unrepresentative plan, since the only reaction manifested will be in financial circles.

The press as a rule will not discuss money. Like the average politician and the average layman and the average professional, the average editor realizes the futility of analyzing the subject, confused by theories and facts adduced throughout several centuries. Moreover, he feels safe in shunning it because of the certainty that most readers are not interested, as nothing about money appeals to them except how to make it quickly. As a topic it is disguised as "cost of living."

International Bankers Control Our Money Ideas

THE financial world, however, keenly scenting the political breath, reacts at once. This reaction varies. It ignores, it objects, it approves. Sometimes it misses its point, but without serious results. What happens thereafter is obvious. If it is a routine administrative matter nothing is done. If it is something that the financiers consider as being advantageous to themselves, they support it, overtly or secretly, depending upon the circumstances and the times. If it is against their interests, they object and act accordingly.

From time to time there have been Americans who have gone on record with their views, disputing the present system of finance. It has been, however, the single, unhonored voice. Where it attained the distinction of a hearing, it was dismissed without compliment as revolutionary or radical. This criticism has always been deadly. The mere combination of the two words, "radical" and "money," strikes panic everywhere. Greatly to the advantage of these protected financial interests, they can now point to certain war-ravaged European nations and say triumphantly: "There; they have tried their new notions; there the government is money; see what it has caused?"

Finance as practiced today in the United States is a very poor example of progress. It has not yet reached the point where it consumes itself, but it has virtually stopped reproducing. American finance today yields nothing except to the fortunate few who are not in immediate need. It points to existing ills elsewhere but does not advance any suggestions which might cost money or effort. This is true of the politicians as well as of the financiers whose views they unconsciously reflect.

The hope of displacing London with New York has been frequently uttered; but it is a vain hope. Feeble, almost unnoticeable attempts, have been made by associations to wag the financial dog by its tail, but in every case they have been afraid of both bark and bite. At Washington proud plans have been laid to do by law what could not be done with money, and the results have been nil.

Bankers Lose Most If Gold Standard Goes

SUGGESTIONS have been advanced for the establishment of a great international bank, on a gold basis. The theory is excellent, but the one fact remains—that gold failing to do what it was expected to do at the first serious emergency, it can hardly fulfill expectations through the operation of an experimental organization as that proposed. In setting aside this particular suggestion note should be made that its only weakness is to provide the very metal that for the time being has been set aside in Europe, within certain boundaries.

Dissenters have raised the cry that any attempt to trade with Europe now means the depreciation of our prosperous dollar, whatever a prosperous dollar may be, to the level of worthless money. The point they raise is obvious; but the twist of meaning is even more so. There is, naturally, every reason why the dollar unit of exchange cannot be equalized to depreciated units elsewhere, but apart from this technicality, natural and artificial wealth combined has not depreciated intrinsically.

Whatever difference exists in price unit, beyond the normal and accountable difference of values of a given article as between country and country, is due to the speculation in exchange, and this speculation is possible solely because the fiction that money establishes value is maintained by the money sellers. A pound of French silk or a gallon of Italian olive oil or a dozen German knives are units of wealth the world over, as is the bushel of American flour, subject in each case to the immutable law of supply and demand. If given quantities of these articles were traded in on the basis of ancient barter each trader would receive an adequate value in exchange. As soon, however, as the modern method of finance on the gold basis requires that each article must first be reduced into terms of gold, values are dislocated, and the goldless trader is penalized accordingly.

What is the underlying lesson in all this?

It is that while bankers in general do not regard foreign exchange operations as a very important source of their profits (not in this country in normal times) they see an immediate loss to themselves as soon as a definite attempt is made to suspend the gold standard. Yet suspended it must be, or almost suspended, since Europe will never again have gold enough to restore its own. The Orient is satisfied with silver. Bankers in America cannot retain the gold standard and do business abroad, too. Something must give.

The suggestion arises that the government can and must enter into the breach. The government must, but whether it can or knows how is conjectural. The banks control public opinion. Regardless of the liquidity of our currency under the new laws, the professional dealers in money can instill fear in every voter by the merest hint. It is the weakness of the electorate, as of everybody else, that the pocket can be made to hurt—and financial hypochondria is the biggest card that the banking profession can play.

American banking is essentially a family affair. From the days nearly a century ago, when Nicholas Biddle emerged as a great financier, to this moment, when his descendants are related by blood and other ties to the leading bankers of the East, this small clique has reigned supreme in money matters. This statement should not be taken to signify that these clever individuals have exercised their influence against the good of the nation, but merely that they have held to a single belief—the doctrine which today dictates or regulates every bit of financial legislation enacted at Washington.

This is the silent and powerful wing that is marshaled for attack or defense whenever the Congress of the United States is confronted with the need of remedial laws. But what can Congress do? There is no one else to call. All bankers belong to the same single-track school of thought. The rural banker may not know how to expound his views with the same certainty, deliberation, wording and effect as can his more sophisticated fellow of the metropolis, but the class instinct is cohesive. Whenever an independent voice expresses novel views, reforms, changes, it is smothered by the opposition.

Money—Most Common Thing—Least Understood

THE sovereign voter has no chance. It is his money, but some greater power controls its destiny. For that he has himself to blame, although it is not solely an American shortcoming. Of a thousand who read assiduously the sport pages of the newspapers not one reads the statement of the condition of the Treasury. Some do pay the financial section the honor of a cursory glance, but that is because they may be the proud owners of stock—even if it be the first payment on a single $100 certificate. Yet the latter is essentially a speculative interest; it is not financial analysis.

These negligent individuals do not realize that as taxpayers they are primarily held responsible for the government's success in placing a block of certificates of indebtedness, and that they themselves must pay for the privilege, by devious and hidden ways.

But the situation is difficult to remedy. It is a matter of evolution. *The most commonplace thing in the world—money—is the least understood.* In this country the government has rendered the problem even more difficult by its shortsighted policy. To reform now would be a jolt—and where are the politicians that dare to give it?

From time to time, too, there appear monographs or statements by experts and students on the subject of money, but read as one will, they are unanimous in placing gold in its accustomed miraculous niche. This circumstance must be borne in mind because these authorities, usually university professors, are about the only ones called at Washington, besides the bankers, whenever financial legislation is under consideration.

One of these authorities professes to believe that there exists popular discontent over paper money. No one is actually aware of this discontent; although in relation to Federal Reserve notes—which are partly gold value and partly "promise to pay"—one might justifiably doubt the efficacy of the gold fraction. A Federal promise to pay would be just as good.

Money metal has been in use for centuries. That does not mean, however, that it is infallible. In fact, there is every evidence that negotiable paper on the one hand, and government evidences of indebtedness, have displaced almost all metal. Said one of these authorities: "Out in the open country, far from the centers of banking, most of the millions of Americans live; and these millions do, in fact, control the government and the nation. Most of these millions know nothing of the Federal Reserve system beyond seeing this new and relatively powerless paper money." Then follows the suggestion that gold be replaced upon the counters of all banks to "be taken at sight by bona fide depositors, as of old."

But the banks themselves do not want to be bothered with gold, apart from the cost of carrying large stocks of it and its occasional falling under the limits of tolerance. No sane American or foreigner looks to the *banks* for gold. He likes to get it if he wants it, but in the aggregate it is an infinitesimal amount that turns over more likely than not, since it returns to the Treasury sooner or later. A jewelry store would be the logical place to buy coins that are Federal medals.

The modern school of thought has practically eliminated the gold standard from practice. This same school would substitute the government as the source of money, to be issued as needed, within a reasonable ratio, based upon national wealth and annual turnover. The suggestion is logical. As long as money is a medium of exchange it need not be one thing in preference to another. Practice has popularized paper, so paper may well continue its present function.

It would be at once objected that paper without gold (or silver at least) would not be "money." But the people do not want "money," whether it is metal or something else. They want something that is current and which they can exchange for whatever commodities they happen to need. Today gold is the shadow behind all these exchanges—but it is a shadow that can be eliminated without disturbing the equation.

Naturally, it will not be possible to rearrange finance on this basis as long as the present superstition holds its place. Back of it are all the stockholders of the banks. Back of these are the hosts of petty speculators. The only real profit the average banker makes today is through the gold fiction. The speculative element would vanish with the elimination of the metal standard. Moreover, if the government issued money on its own account, under a well-thought-out, practical, automatic law, the government would not have to borrow money, or sell certificates of indebtedness (to buy them back at a premium, for that is what interest amounts to) or go to great expense to accommodate its finances through the agency of the very banks it has licensed to operate.

Fiat Money! All Money Is That

FIAT money—that is the damning term with which bankers dispose of it. But what are their own bank notes? Fiat money, they say, would be a mere promise to pay, with nothing behind it to guarantee payment. But is gold or silver a guarantee? Are either of any use to a community that practically boycotted both years ago? Money issued by the government under its constitutional sovereign right would be, in fine, evidence of indebtedness; a promissory note of the government payable to bearer. Enough of such certificates could be issued, to put it mildly, as would in turn be repayable to the government as taxes and miscellaneous revenues. How long since the government accepted its own paper for the purpose? Only at the time of writing the Secretary of the Treasury announced that income tax could be paid with Victory notes. If money were tendered would it not oblige the government to do that much more bookkeeping?

There is another example, not universal, not representative enough. The owner of any government bond, regardless of its issue or rate, can tender it as payment for any purchase made in the larger cities, and probably in the country, too. It is not money, no, but it is a medium of exchange. The only objection to it as things stand now is that it must be taken to the bank and sold and the banker must get his profit out of it, but as far as market value goes it is a good medium. Either the man who can keep it as an investment, or the man who must deposit it subject to "market deductions," has faith in the words, "United States of America."

If bonds with a variable value prior to maturity are a medium of exchange, it is obvious that a definite evidence of United States indebtedness, like the greenbacks, would not be subject to the vicissitudes of collection charges and operations so dear to the managers of our present complicated financial system.

The only possible objection to the value of such money is that involving the stability of government. It is a valid objection, theoretically. But how long would any government last, here or anywhere, if tomorrow the people decided to demand cash—all gold—for all their apparently cash deposits in the banks?

Cash Business Would Ruin the Money System

NOW, the people are not hankering for governmental disturbances. What they want is the quickest, most efficacious means by which trade can be carried on. They want a medium that among themselves is at once recognized as interchangeable. The only way to give it authority is by the power of the government. They can use no more than the value of the commodities in which they trade. Nature itself imposes a limit, and the limit is not difficult to ascertain.

The late A. Barton Hepburn, one of the best-known bankers of the country, while Controller of the Currency in 1892 said that the public should see and realize "how small a percentage of business transactions are represented by actual money, and how impossible it is for the government to furnish a volume of currency sufficient to meet the wants of the people at all times—that is, in times of general distress or quasi-panic." Mr. Hepburn vouched for the fact that 30 years ago "more than 90 per cent of all business transactions are done by means of credit." If credit is impaired or refused, "it is easy to realize how impossible it is for the remaining 10 per cent of money to carry on the business of the country without monetary stringency and financial distress." Business done solely for cash would ruin the system.

After Ireland: Egypt Demands Her Freedom

Nation Is United in Stand Against Rule by Great Britain

By W. P. CROZIER

IRELAND becomes a Free State; in India the ferment grows; in Egypt it has boiled over and settled down again for the time, with Zaghlul Pasha, the Nationalist leader, and five of his principal lieutenants prisoners on a British warship bound for exile in Ceylon. The demand of Egypt for complete freedom is a simpler thing than that of the Hindu-Moslem leaders in India. The three hundred millions of Indians are not a nation. They are a medley of races and religions; they are divided into two main sections which from ancient times have been at each other's throats whenever a strong controlling hand was withdrawn; and from ancient times, unless a protector were at hand, they have been the prey of enemies pouring down into the plains of India from the mountains of the northwest. But Egypt is a nation, lying compact in its river valley with its fourteen million inhabitants, and until Europe stepped in some 40 years ago it enjoyed powers of self-government that were only limited by the shadowy suzerainty of the Sultan of Turkey.

Neither England nor any other European power had any legal right to be master in Egypt. But Europe had great financial interests in Egypt, not to mention the Suez Canal, and the Egyptian Government was weak and corrupt, inviting intervention. England went in and established herself, very much to the benefit, in a material sense, of the Egyptians, who have had the, for them, unknown experience of the honest, upright government to which Theodore Roosevelt bore outspoken testimony during his famous tour in the Old World. But although an English agent like Lord Cromer was not only ruler but autocrat in Egypt, he was in theory only an agent on the same level as the agent of France or Italy. Only, he had troops and ships behind him. (France, to whom British predominance in Egypt was a most bitter grievance, only patched up the feud in 1914, when England gave her a *quid pro quo* in Morocco.)

With the Great War, England declared the suzerainty of the Sultan of Turkey abolished. Egypt became a British protectorate by British proclamation. The Suez Canal was the great highway for the transport of troops to and from the East. Egypt furnished a great labor corps for use in the Sinai and Palestine campaigns. When at last the war was over, Egypt was moved by the same breath of freedom which blew through all the world. She had heard so much about the principles for which the western powers had fought the war; she expected some of them to be translated into fact. In particular, her spokesmen said that the protectorate had been an emergency measure of the war, that it should be forthwith abolished and Egypt's sovereignty restored. In 1919 there was a rebellion—due to many causes, besides political grievances—and then the British Government took action. It is unfortunately true that imperial governments rarely do take action to extend the bounds of freedom until an outbreak of violence has forced their hands. (Witness the Irish Free State!) The British Government sent out Lord Milner to inquire how the demand of the Egyptian nation for its freedom could be fulfilled without undue injury to foreign interests. It should be remembered that there are other foreign interests of great magnitude in Egypt besides the British—notably French, Italian and Greek. The British Government has always been troubled by the thought that if it moved out of Egypt and the Egyptian Government failed to keep peace and order (which is not at all unlikely), another power might suddenly step in with military force. So do they trust each other in the Old World.

Lord Milner reported, the British Government refused to accept his recommendations in important respects and made its own proposals to the Egyptian delegation headed by Adly Pasha, the prime minister. These the Egyptians rejected and the whole nation, including both the moderates under Adly and the extreme wing under Zaghlul, now stands united in the demand for genuine independence. Lord Allenby, at the first sign of disorder, applied the "firm hand" of military rule—a reinforced garrison, warships up the Nile, arrests, deportations, threats to disperse unlawful assemblies by bombs from airplanes. Now let us see what really is at issue:

The Milner plan promised Egypt an "independent constitutional monarchy"—note well the "independent." The British Government plan also proposed to recognize Egypt's sovereignty as expressed through "a perpetual treaty and bond of peace, unity and alliance." But this "sovereignty" and "independence" are to be severely limited, how severely may be judged when the provisions are compared with those of the treaty just concluded with Ireland.

There is a British Army in Egypt. It is on this, and on nothing else, that the British control of the Egyptian nation rests. The Egyptians, however, freely admit that the communications with the East through the Suez Canal are so important to England (and, it may be added, to many other countries, too), that England may reasonably demand the right to keep a military force somewhere in Egypt until Egypt shows that she is willing and competent to act as trustee for the canal. But where should this force be?

The Egyptians say they would not object to its being stationed in the "Canal Zone"; that is, at certain agreed points on or near the canal. Then it would be in a strong position to protect the line of communications and at the same time it would not offend the pride and dignity of Egypt, as anything in the nature of an army of occupation necessarily must.

The British Government will not agree to this. Even the foreign office, which expresses the moderate British view, will not hear of it. The foreign office declares that the security of the canal is only one of England's primary interests in Egypt. The other is the security of foreign lives and interests in the country. It recalls that last year disastrous riots broke out in Alexandria; that they were directed against foreigners and especially against Greeks; and that they could only be quelled in the end by the use of British troops after native resources had been tried and failed. What, says the foreign office, will happen if, after Egypt has gained her independence and the British troops have withdrawn to fixed camps on the canal, mob rule breaks out in Alexandria and numbers, say, of Frenchmen and Italians are slain? Will anything prevent France and Italy sending troops and warships to intervene? And, when they have once set foot in Egypt, who will make them withdraw—witness the chain of events when once the British had landed in Egypt after the Alexandria riots in the early '80's? So the foreign office demands that British troops, after Egypt becomes sovereign and independent, should be stationed not actually in but near the great towns. This, say the Egyptians, is not compatible with the existence of a free and independent Egypt. It is as though in the new Irish Free State large bodies of British troops were to be posted in camps outside Dublin, Cork, Limerick and other Irish cities.

But the demand of the foreign office by no means satisfies the war office, which has the powerful support of Winston Churchill. The business of the war office is to look at all things from the strictly military point of view and this idea of having troops posted at fixed points outside the towns hampers the plans of the general staff. The war office asks, in a word, for the right to have any number of troops anywhere, and the British Government has accepted the plea and now imposes it as a condition upon Egypt. As this is the rock on which above all else the negotiations have split and Egypt has become acutely hostile to England, I quote the clause:

> British forces shall have free passage through Egypt and shall be maintained at such places in Egypt and for such periods as shall from time to time be determined. They shall also at all times have facilities, as at present, for the acquisition and use of barracks, exercise grounds, aerodromes, naval yards and naval harbors.

Now, the necessity and the morality of such a condition as this may or may not be arguable, but it is surely not arguable that any nation on which such a restriction is imposed enjoys sovereignty or independence. It is quite plain that it does not. But the conclusion that Egypt is in fact being offered something that is rather like a protectorate is confirmed by the other restrictions on which the British Government insists.

For instance, foreign relations. That is always a test of sovereign rights. Thus the Afghans, by the war of 1919, have won for themselves the right to direct their own foreign policy and so have asserted their complete independence of the Indian Government. The Milner report made this proposal:

> Egypt will undertake not to adopt in foreign countries an attitude which is inconsistent with the alliance or will create difficulties for Great Britain and will also undertake not to enter into any agreement with a foreign power which is prejudicial to British interests.

Not an unreasonable stipulation, it may be thought, if England is withdrawing from the virtual possession which she has of Egypt. But the actual proposal of the British Government goes beyond this. It is that the British High Commissioner—the Egyptians object to this title—should be consulted before Egypt enters into any new political agreement. That is to say, Egypt will have to obtain the approval of the British envoy on the spot before it can make any contract with a foreign power. Again, there may or may not be a good case for this, but according to all accepted notions it involves a most serious diminution of a nation's sovereignty. The right which would be granted Egypt to have her own ministers and consuls in London and elsewhere is scarcely a compensation.

There is to be a Financial Commissioner who must consent to the raising of external loans, and the allocation of public revenue, and there will be a Judicial Commissioner, similarly appointed, whose function it will be to look after the interests of foreigners. The Egyptian criticism is that these officials would exercise an intolerable interference with the administration of Egypt in respect of foreign affairs, finance and justice. So, of course, they would from the point of view of absolute self-government, just as the existence of the lord lieutenant in Ireland, of the oath of allegiance and the rights of the British Navy is, to the rigid Republican, a violation of the pure word of the republic. The British Government, of course—and probably most other modern governments—feels a pretty definite mistrust of the capacity of the Egyptians to manage finance and justice efficiently and with integrity. The record of the old Egypt did not stand high in that respect. The new Egypt, part of which has had 40 years' training under British rule, may possibly be better, but there are enormous foreign interests involved and many persons fear the uproar, the protests and the intrigues that will spring up in this country and that, if foreign interests and lives suffer under the new régime. And it is true that the experiments in democracy which have been made in such countries as Turkey, Persia and China are no more encouraging than the record of the ruling Egyptian classes themselves in the last century.

Nevertheless, England will certainly have to go further in the way of concessions than she has gone. The Egyptian people are united as they have never been before; and even the Christian Copts and the Moslems have joined hands. Zaghlul, the leader, has been deported to Ceylon, but the trouble is now with the people of Egypt, and a whole people cannot be deported. Nor can it permanently be kept down under martial law, especially if it is willing to consider the special character of British interests in the country. The truth is that every power which has held another people in subjection is bound to take some risk when it gives the desired liberty. It is so in Ireland, we see it in India and it will be so in Egypt. From the British point of view we could wish that Egypt, too, might be willing to take the position of a dominion within the British Empire. That would simplify much. But the Egyptians are thinking of liberty and not of simplifying the troubles of the British Empire.

(Wildman Magazine and News Service)

Cairo, the capital of Egypt, the people of which are demanding absolute independence and the rescinding of the British protectorate, which has been in force since the outbreak of the World War. Cairo was built about 970 and contains some of the finest Egyptian and Moorish architecture.

A Year of Harding: "Show Me," Still the Rule

An Analysis of the National Temper Toward the Administration

THIS is the time of the year when every voter's fancy turns to thoughts of Washington, the cradle of our government, the receptacle of our taxes, the pride of the politicians, the Elysium of easy jobs, the *kala jagah* of the lobbyists, the zenana of the vested interests, and yet, paradoxically, the phenix of the nation.

Just now the capital is staging the most unique political demonstration ever made. It is a race—if such it may be called—with a single entrant. It is a joust, but against an absent foe. It is a pageant, but it is somber and muffled. It is, in short, everything that a political anniversary has never been before.

For once an administration must prove to the people that it knows what and how to do. For once an administration cannot substitute self-glorification for popular service. For once an administration is obliged to watch its step, to think of today and let tomorrow take care of itself.

No wonder politicians are dumfounded, speechless, anxious! No wonder legislators are black-browed, caustic, acrimonious! No wonder statesmen are timid, self-conscious, ambiguous! What else could be expected of these politicians, legislators, statesmen, singly and together—hitherto accustomed to promise what the people wanted and then give them the merry ha-ha—now finding themselves in their true perspective of public servants, in all that the term implies, with emphasis on service?

A Vote Is Not a Deed, Only a Lease

IMAGINE twenty-five million now penitent voters focusing their cold eye upon this group, once privileged and now so impressionable that it regards that as the orb of a gargantuan cyclops. Aye, because this moloch is capable of visiting the unexpected upon the formerly anointed. It is the symbolized American citizen, in the resurged consciousness of self-governing force.

These millions of Mark-Here-X's, from Neahbay to Manatee and from St. David to Coronado, have come back to earth. They have given up stargazing. They are immune from incantatory biennial rituals, which reach their zenith during the days when the mercury hovers high and vitality is low. They love Washington, Jefferson, Lincoln, Roosevelt, Wilson, but they would rather study the political sagacity of these men from the pages of a trustworthy book than from campaign lithographs and stump spielers.

Because of all of that and sundry things more, this adult army—the best army that any nation is entitled to have and to hold—is biding time. There's not a finger's worth of applause and there is not a frown of hostility. Just onlookers all—calm, patient, neutral, observant. They may not know how to reason, discern, dissect, infer and analyze in accordance with the most scientific mental processes, but they know a hunch when they meet one, and they are making use anew of a specialty that Divine Providence gave to every American.

In other words, the Show-Me! boys are back again. They are back again strong. And with them, this time, are the girls.

The Ancient and Honorable Order of Missourian Wise Ones is back on the job. Hail, the gang's all here! Hail!

Hail, but what?

That's what Washington wants to know. Applause or brickbats? November is a great month for hail. And to be hailed out of political office is never a pleasant prospect. The mere thought of it causes a blue funk.

The bad news that a vote is not a deed, only a lease (occasionally renewable) has at last been understood by the lessees. Absentee suffragism has had its day. It looks as though officeholders who have been squatters with a view of obtaining title have another think coming to them.

Plenty of Publicity, Little Information

THE mistake has often been made, and perhaps that is the mistake now being made, to confuse volubility with publicity. Since the idea of "pitiless publicity" found welcome among the people everybody in office—even the sphynxes—have made statements. Men renowned for their chariness of speech have volunteered elaboration.

There have been oodles and oodles of publicity, of a kind. There have been preambles upon preambles, so stilted as to make much plainer the fact that statesmanship that is not self-explanatory is not to the liking of the citizen who wants to know what is going on. There has been a deluge of ponderous language, which has alarmed the average person of common-school degree, who finds high-toned English very objectionable.

In other words, there has been much publicity but very little information. There is a feeling that not everything has been told, even though it may be information held back until each problem is settled. The people seem to feel that they have been talked at and not talked with. There is the rankling irritation that the upper governing circles have detached themselves a little too patently from the common herd.

The President aims to be understood; he wishes to be as confiding as possible; ambiguity is not a formidable part of his vocabulary; and yet, in spite of all that, he has not quite reached the mental level of the people. By these is meant the common, garden-variety of sinner; the males and the females who represent four out of every five of our population; the men and women who make no pretense of understanding more than they have learned. These are the very people to whom the President addressed himself since last March and who, a short time before, put him where he is.

Of course, it is not a simple matter to maintain the great dignity of the nation and the presidency while reducing it to terms of a McGuffy reader, but it can be done. The President who will do it will be forgiven anything. The people would like to see the job of presidenting, cabineteering, congressing and Uncle Samming in general described so as to square with the Dana and Greeley school of journalism.

At the end of his first year, therefore, President Harding has not quite established that sympathetic contact with the people that he looked forward to attaining. He has their sympathy, but in a sort of general way. The true bond of understanding, of common thought—even though it be a differing opinion—of earthy affairs, does not exist.

Unfortunately, virtually every one of the so-called "best minds" he has rallied to his side represents the same superior strain, the rather obvious implication that government must be surrounded by an aura of verbosity lest the people be not impressed by its majesty. Of course, what these best minds do is of little consequence. The writer makes this statement full well knowing that it will wound the *amour propre* of those who identify themselves as among them, because the average man cannot tell you the names of five of those chosen few, either as a guess or as a certainty.

As far as the general run of people goes, President Harding is regarded as the whole works. He is coal that generates the steam, the steam that runs the dynamo, the dynamo that produces energy, and the energy that is supposed to bring results. Identity and personality, so far as the others are concerned, never before counted for so little.

The people are anxious about their living problems. That's a vulgar, selfish, sordid attitude. They care nothing at all about foreign affairs. When they hear of them now they curl up like so many armadillos. In other days they might have hearkened unto them, provided they could have been translated into honest slang, but because they were not, the presidency went to the man who *least* referred to them. Look it up.

There has been much said about our reapproach to normal. But your neighbor in the street car, your *vis-à-vis* in the cafeteria, the clerk who waits on you, all representative average citizens, tell a different story, and *theirs is the story that counts*. They have no grudge, no chip on the shoulder, no hard luck tales to tell, no special favors to ask. They may be in error or their reasoning be hasty and faulty, but they deal with hand-to-mouth facts most at heart among us common mortals; words are not going to cut any ice with them.

To repeat, President Harding has failed to establish a perfect point of common understanding with that class from which he sprang and with which for a long time he broke bread.

Campaign "Folksiness" All Gone

TO UNDERSTAND the situation it must be remembered that, as already indicated, the G.O.P. is a fairly old institution with millions of votaries, but as far as the country is concerned Warren G. Harding is the Republican Party; far more so than President Wilson *was* the Democratic Party. In other words, President Harding is "it."

It may have been noticed that since he assumed office, nothing has been said about President Harding being "just folks," although this was a strong campaign slogan. I don't know who started that idea circulating. It led many a Yankee to visualize a "Way-Down-East" setting for the White House, and since Vice-President Coolidge gathered hay in Vermont during the summer of 1920 everything seemed to be in readiness. Yes, everything except the elusive folksiness. Friendly, cordial, solicitous, indulgent, obliging—Mr. Harding transferred his inclinations and idiosyncrasies from Wyoming avenue to Pennsylvania avenue without reservations, imposing thereafter those more or less rigid restrictions attaching to the office he now holds.

He is accessible to the classes now as he was in his senatorial days, except that then he had just a little more time, but he was not gregarious, and his personal circle of acquaintances has grown slowly. Of course, the official intimacy with certain anointed spheres of the capital's life may have its ultimate effect, but that's neither here nor there: The writer wishes to set straight the belief that the President has emerged from his folksy chrysalis, because he never was in one.

The bonus problem is the weakest administration spot, but as to its political vulnerability some doubts exist. But probably never before have so many intelligent individuals, rich and poor, agreed upon a single thought, irrespective of the good or bad the bonus might do. That thought is that if the people can help it, this is the last time that politicians, administrators and their ilk, are going to play football with an idea with ulterior motives.

For, after all, divested of all its legends, allegories, fables, truths, half truths and fallacies, the question to be determined is which of the two would be more useful or important—*the legion vote or the business men's campaign cash*. The latter is nothing to brag about, and that's perhaps why it has been running a bad second, except for presidential guidance, since the collections for defraying accumulated debts are still several hundred thousand dollars shy and harder to get every day. The probable net strength of the vote may be considerable or infinitesimal; it depends upon who is doing the estimating.

At last accounts, politicians were planning to postpone a decision for about a year, taking care, however, to agitate the existence of it so that the former soldiers shall not forget that Washington is standing by its 1917 cry: "Nothing will be too good for them." This, theoretically, should, according to Hoyle, bring the congressional vote, lull the suspicious business world, and save the day.

Business, after all, offers the true keynote. The former soldiers include men who are valuable productive units. They are getting nothing now, except a lot of really undesirable maudlin sympathy, because the one source of wealth has been obstructed by means of grandiloquent politics, both of omission and commission. The only business that runs at normal today is that directed by men who have forgotten, or have never known, that Washington exists—an uncomplimentary but sane attitude.

The prosperity which the White House professes to read from a national bank statement is about as tangible as air; the money is there, and so is the air; but only a scientist can get his hands on the air and make it do tricks, and only an insider can get to that money. Money in the banks? "Try to get it," says the business man.

Great financiers, great co-ordinators, great international experts, according to the G. O. P. biographies, are working 16 hours a day, but they have buttered no parsnips for the proletariat. It may not be their fault, but the growing belief is that the political year 1910 is going to be duplicated, with due allowance for economic conditions. That period came in that era when the *vox populi* was heard upon the slightest provocation, when they were apt to sing hallelujahs with their eyes closed because their thumbs were turned down. There are many parallels that make foster brothers of 1910 and 1922, as of today.

The Soft Snap Still Lives at Washington

HOPE is no longer the first-aid-to-the-voter given by the politician. Let's get this straight. The voter wants to know. He is not asking the world. But he wants to know, nevertheless, and the politician had better not tell him (or her) to hope. The politician had better tell all he knows of the facts, and then the voter will do the hoping on his own account.

Another thing, still waters run deep, and Washington's depths are surging and seething with intrigues, conflicts, revolts, truces, and all the intermediate relationships. Federal reorganization of the departments is on but it's off. Several plans have been offered, the most important ones following the suggestions contained in these columns several months ago, but how to pry a bureau from one department to give it to another no one can do it except the President himself, and he is not looking for trouble.

The clerical personnel still exceeds by many thousands the true requirements, even with the allowable margin of overstaffing as practiced by an inefficient Uncle, while salaries are raised in the most ridiculous fashion, without regard to worth, or even logic, so that an $1,800 clerk was raised to $7,500 as an assistant secretary (only a vigorous opposition kept the figure from reaching $10,000), while a former and experienced and efficient American ambassador drew about $4,500 as assistant secretary, or $13,000 less than his last government job. The snaps are softer than ever.

There was a hope that President Harding would be energetic, in his proposal to take government from business and put business in government, in speeding the dozen boards and commissions that, under one pretext or another, are hanging on and thriving better than ever. Some are the receiving end of camouflaged patronage, but the very best commission or board is useless, un-American and discriminatory.

The Political Calm Before the—What?

GETTING down to brass tacks, however, Washington today is an uneven mixture of administration. There are some high-toned officials on the one hand and some conspicuous provincials on the other. Looked at from the viewpoint of experience, it offers some rather amusing contrasts. To the one who knows Washington life, and hears the opinions of every one, with equal impartiality, it looks as if the best stories will never reach the public.

But be that as it may, the President would like some sign by the people—some demonstration of praise, to which he would react pleasurably. Working, as is now the case, his way out with no indicative approbation is anything but pleasant. Their very neutrality renders suspicious the torrent of encomiums that has been let loose in London, and the puffs at the Pilgrims' dinner will not be overlooked by that irreconcilable element that is suspicious of all foreigners bearing gifts, to paraphrase an old saying.

A few eyes are figuratively turned to the forthcoming congressional elections, but what they will mean in terms of 1924 is next to impossible to determine. Some political necromancers have done so, but they can only guess. It will be much safer to take for granted that there will be no judgment of the administration this year, favorable or unfavorable. As already said, the people are calm, patient, neutral, noncommittal. They will vote for senators and representatives because they have to, and while it will be possible after all the returns are in to advance a surmise, put it in your hat that President Harding will be left unhampered, unmolested, uncriticized, for two years more anyhow.

Until then the Missouri boys and girls are ready to be shown.

The "Money Mystery" Baffles Government

Concluded from page 8

The inquiry of 1892 was directly aimed at the non-liquidity of currency under the laws of that time. Since then the laws have been amended and added to, but although panic has been avoided, it does not mean that there has not been money stringency and financial distress. Ask any humble business man. Try to get a loan at the banks. Pawn a bit of jewelry. When one of the largest pawnbrokers of New York City announced a maximum loan of $100 on any one pledge, regardless of its value, it was because the banks would not provide enough loanable funds. Yet there was gold, silver, platinum, precious stones, in these pledges. If gold is money why the discrimination?

If metals and precious stones, admitting their slow marketability during the deflation period, were not good collateral, intrinsically as raw materials, what possible good could be the gold and silver in the bank vaults?

That is merely one of the involved and incomprehensible incidents of our financial system. It is self-contradictory on the face of it. It is more than that. It is a policy that repudiates gold and silver and platinum and precious stones, all of which at one time or another have been and are media of exchange, and have a fairly fixed value, because paper money—money that means nothing, if one must take the bankers at their word—would not be given for one or two of the very metals that are supposed to guarantee the paper sought. It was not a question of a glutted market and trying to sell with no demand; it was merely a case of collateral.

Of course, all these points are quite involved. To follow each one to its lair is no mean accomplishment. But such a mastodontic attempt would not lead to very much with the present temper of the industrial and banking world, and with the people perfectly content to get whatever money the government provides. It is not for them, in their own minds, to question the fundamental values, mythical and actual, of the coin that makes life so easy for them as long as the required supply is not interrupted. They "pass the buck" to the legislators; the legislators return it to the people. And the bankers get the lion's share of the profits.

Government officials are afraid of nothing so much as of establishing precedents, whether dangerous or harmless. The influence of practically the entire financial world would confront them in any attempt to reform or improve the situation. This alone is discouraging enough—and they fear the possibility of being made to appear ridiculous. The effects of the war have fortified, albeit erroneously, the ultra-conservatives. In plain, unadorned language, they know now what they have, but they do not know what they would have in the end.

It is a fact that if the government issued all money, contracting or expanding the currency in accordance with the nation's economic needs, it would eliminate that choice bit of investment paper—the government bond. Every ambitious investor hopes and hopes to have a few government bonds—even when the net return was less than two per cent, before the war upset the rates. No government bonds—no public debt—and there would be no interest. That is an excellent outlook, a perfect theory, but only to the man who is not a bond investor or to the one too poor to invest. Nor is that all; it might come to pass that without competition by a borrowing government, private bond issues would be floated at reduced interest, thus decreasing income all along the line. Then capital would have to work and not speculate.

It will convince no one, generally, to say that all interest must come out of capital, and that unless capital reproduces itself plus the interest, it must be at the expense of the multitude—with consequent general impoverishment.

Government officials base their beliefs upon environment, and what this is we all know. It is useless to look for aid from them. Aid must come from the outside. It is up to the people themselves. But one thing is evident—that there is too much speculative capital, too much "lazy" money, and too little reproductive capital. The only way to readjust this discrepancy is by heavily taxing all incomes deriving from what may be termed "bookkeeping enterprises," although such a law might split hairs with the Constitution.

The opposition upon any single reform will be formidable. It is felt in advance of legislation, and that alone is a deterrent. We have the example of two or three noted members of Congress that do not hesitate to differ from the rest of their colleagues upon many matters, and more or less good-naturedly they are dubbed "irreconcilables," "radicals," and the like. It requires unbounded self-confidence to live day in and day out in this sort of official isolation. It requires nerves of iron and a powerful constitution to nourish such moral courage. In fact, it takes more than is the average administrative or legislative officer's meed of it.

Ottawa, the Picturesque Capital of Canada

Concluded from page 3

quins and their French allies fought many sanguinary encounters with the fierce Iroquois. The Long Sault probably will remain forever identified with the memory of deeds of extraordinary heroism in these fights to the death between the French newcomers and the ferocious aborigine, who mayhap already felt a premonitory sense of his impending extinction at the hand of these encroaching Europeans. One of the points which the Iroquois frequently chose to ambush their enemy was where is now the present site of Ottawa.

With the passing of French rule in Canada the work of exploration received a check, so that it was not until 1796 that any traveler of importance visited the Chaudiére. In that year came Philemon Wright, of Woburn, near Boston, Massachusetts, who came first to spy out the land. Later he brought his own and five other families, with everything necessary for the founding of the colony which he had decided to establish near the Chaudiére, on the north bank of the river. This was in 1800.

Philemon Wright became a power in the land and at his death left to his heirs an extensive and valuable estate. The city of Hull now marks the site of Philemon Wright's settlement; and the county which was later formed out of the domain over which he once held sway perpetuates his name.

While Philemon Wright was building his prosperous community on the north bank of the river, the bluffs opposite still formed part of the primeval forest. For more than a quarter of a century after the coming of Philemon Wright the south bank of the river remained practically undisturbed. But in 1826 there came a change. In that year a deep, rocky gorge which cleft the bluffs a short distance east of the Chaudiére was chosen by Colonel By, of the Royal Engineers, as the outlet of the canal that he had been ordered by the Imperial government to construct from Kingston, on the Great Lakes, to the Ottawa River.

This ambitious project was an aftermath of the War of 1812. It was felt that an alternative route should be provided for the transfer of troops from one of the Canadian provinces to the other, the only previous route being along the boundary waters of the Great Lakes and connecting rivers.

The Rideau River and the series of lakes out of which it flows were utilized and form the greater portion of the canal. Commenced in 1826, it was completed in 1832, a considerable engineering feat for those days

Immediately after the selection of Ottawa as the capital, work was begun on the construction of the parliament buildings. They were completed and ready for occupancy in 1866. The main legislative buildings contain the Senate and the House of Commons chambers. The main buildings stand on the highest part of the bluff, facing on a fine square. They are pure Gothic in design, free from fictitious ornamentation. On the eastern and western sides of the quadrangle are built lesser buildings, similar in design (but perhaps of a somewhat later period), devoted to departmental offices. Behind the parliament buildings, proper, almost on the edge of the cliff, is the parliamentary library, built in the shape of a great dome, 140 feet inside from floor to ceiling.

In 1916 the original parliament buildings were destroyed by fire. The library and the two flanking departmental buildings were saved. Plans were immediately made to rebuild; and at the time this is written a nobler set of buildings stands on the old site. The same general style of architecture has been followed, and the buildings are of approximately the same dimensions, excepting that they are one story higher, and the tower, although not yet completed, will rise to a height of 300 feet. In the tower, in addition to a large clock, will be placed a carillon of bells.

The aim of the architects is to have the new buildings as representative of Canadian industry and resources as possible. Hence, for the exterior walls Nepean sandstone, obtained near Ottawa, has been used. The same kind of stone was utilized in the original buildings and in the two departmental blocks. When exposed to the weather it takes on a variety of beautiful tints, increasing in richness with the years; while its indigenousness is particularly appropriate.

For the interiors, Tyndall limestone has been brought from Manitoba; the marble comes from British Columbia quarries. The interior stone is richly carved in patterns and designs symbolical of incidents in Canadian history.

"That's What We're Built On—Broken Homes!"

Concluded from page 2

the fundamental sincerity and moral purpose behind the muck-raking school of magazine journalists. They had shown their appreciation by buying the magazines and cleaning out the old guard in politics.

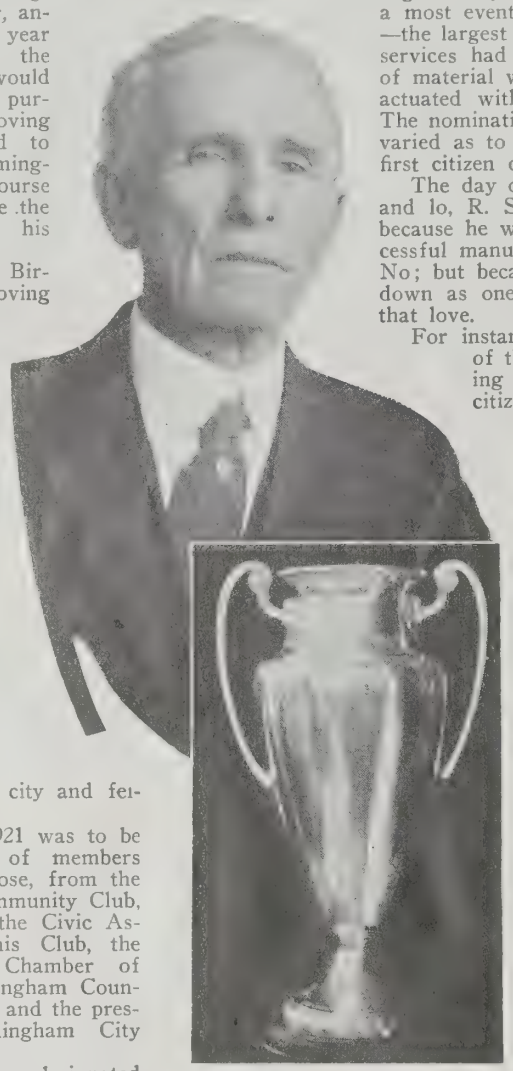
Only a faction of the daily newspapers had followed the lead of the magazines, although the Hearst press may claim to have preceded them. It is interesting here to observe that while Hearst was credited with sensationalism in this period, the so-called sensationalism of his newspapers was entirely different from that they now exhibit. It consisted either of an undue candor about actual facts, in which other newspapers were equally pronounced, or in printing great numbers of stories appealing not to the physically erotic motive but to the sentimentalism and romance of the common people. The Hearst sensationalism which gave the New York *Evening Journal* the largest circulation in America and made it the paper of nurse maids and factory girls was its appeal to the fundamentally decent emotionalism of the middle class—Laura Jean Libby stuff, not Greenwich Village degeneracy.

After the election of 1912 the progressive publishers everywhere felt that exposure and agitation had about reached the limit unless they were to become Socialists. It was then that the sex appeal was decided upon.

This writer attended a conference of editors in 1914 who were managing several newspapers belonging to a large publishing syndicate. A substitute for muck raking was discussed. The circulation value of feminism was gone into and all present understood that feminism was not a matter of "votes for women" only. The argument was keenly presented on both sides. One group held that the exploitation of sex would prove the road to ruin; they pointed out that despite all recent social and economic changes and the influx of one million immigrants a year American people were still middle-class and mid-Victorian—persistently monogamic and home loving. They pointed out the difference between romance and sentimentalism and the eroticism of the newer school. They believed that there was still more circulation in the labor "bloody shirt"—the Colorado mine strike was then on and it bulked like the beginning of a big industrial transformation. The other group argued that in the cities at least the older standards of propriety had been changed. They pointed out the huge circulations of the foreign-language press and showed that these papers featured the erotic short story or serial exactly as the Continental European press plays it. They called attention to the popularity of serial stories purporting to be revelations of married life, and to the character of letters received by Beatrice Fairfax, Cynthia Grey and other advisers of the lovelorn—some of them most estimable young ladies—others, rollicking Bohemians who never followed their own advice. As in all such debates no conclusion was reached. That debate is still going on wherever newspaper men get together, but at present the sexual ayes seem to have it. And—to paraphrase Don Marquis, it's sex o'clock in the newspapers.

(Wildman Magazine and News Service)

A fishing village near Amsterdam, the chief commercial city of Holland and one of the leading seaports of Europe. The inhabitants of the rural districts and fishing villages of the Netherlands stick to the old-fashioned customs, the Dutch caps, voluminous clothes and wooden shoes. The picture depicts a Marken fisherwoman at a "tie-up" point along the canal.



An Entire City Acclaims One Who Serves

By J. EDMOND BREWTON

"AND lo, his name led all the rest." Robert S. Munger is declared by his fellow men the outstanding citizen in a community of 178,270.

In the early months of 1919, Victor H. Hanson, publisher of the Birmingham, Alabama, *News*, announced that each year thereafter $500 of the newspaper's funds would be set aside for the purchase of a silver loving cup to be awarded to "that citizen of Birmingham, who, in the course of the year, has done the greatest service to his city."

In announcing the Birmingham *News* Loving Cup in 1920 as an annual gift to the community, the statement was amplified in these words: "In announcing this plan the *News* believes it is furthering the highest type of citizenship, the type of citizenship that desires to render ennobling service to city and fellow citizens. Service is the keynote of the day, and the noblest form of service lies in unselfish devotion to the welfare of one's city and fellows."

ROBERT S. MUNGER,
And the loving cup he was awarded for performing the greatest service for his city, Birmingham, Alabama, in a year.

The award for 1921 was to be made by a board of members elected, for the purpose, from the Rotary Club, the Community Club, the Exchange Club, the Civic Association, the Kiwanis Club, the Civitan Club, the Chamber of Commerce, the Birmingham Council of Women's Clubs and the president of the Birmingham City Commission.

These organizations designated the members of the board—broad-minded, representative citizens—in the autumn of 1921, and sessions began early in December. The year 1921 had been a most eventful period in the history of Birmingham—the largest city of its age in America. Many notable services had been performed by its citizens. Citizens of material wealth, as well as those without, appeared actuated with a spirit of service to the community. The nominations were many; the views of the citizens varied as to whom should receive the honor of being first citizen of Birmingham.

The day of announcement came—January 8, 1922—and lo, R. S. Munger's name led all the rest! Not because he was well-to-do, not because he was a successful manufacturer, not because he was an inventor. No; but because he, like Abou Ben Adhem, was writ down as one who loved his fellow man and showed that love.

For instance, there is the story of how the germ of the idea which has made him a commanding figure as a manufacturer, a financier and citizen, was founded in a desire to serve his fellow man. The Civil War was over. There was need for him to help his father in the little lumber mill, which had been built in Mexia, Texas. The senior Munger had added a cotton gin to the concern and placed his son, Robert, who was now about 20 years old, in charge of it.

The dust and lint in the gin room were almost unbearable to the workmen. Much was being said about the health of ginworkers being permanently ruined by it. And, it was then that the idea came to young Robert Munger to attempt to abolish such working conditions.

Then, too, the business end of it appealed to him. Six men were required to operate a steam gin stand. It seemed there was an unnecessary amount of routine labor that ought to be eliminated by mechanical help.

So, young Robert Munger clung to his idea and set his mind to work. He worked at night, at home, after the children were put to bed, planning and drawing and figuring, and Mrs. Munger, whom he had married in 1878—she was Mary Collett, daughter of Captain J. H. Collett, of Austin—always sat up with him and encouraged him and kept him company.

"She has always been my greatest inspiration," said Mr. Munger in talking of those early days. "She has helped me and inspired me and been right with me through it all. She would stay up just as late as I did, and she always was up and fully dressed, no matter how early I had to leave in the morning to get to my work. She would see that I had something to eat and a hearty, cheerful send-off, and I didn't carry away with me any recollections of her in a kimono, either. She was as ready for the trials of the day as I was."

Finally he got the invention all worked out and constructed it—"The Munger System," which eliminated considerable labor and thoroughly cleaned the cotton. A value of from $4 to $5 a bale was added to the cotton because of the thorough cleaning. He patented his process. One man can operate three gin stands under this system—under the old plan 18 would have been required.

Then followed four long years of unavailing struggle to get it adopted by some manufacturer of gins. Finally, he mustered all his resources and started a little plant in Dallas, Texas, in 1884, and began turning out the system himself.

Gin owners saw the advantage, and planters with cotton to gin discovered they were from $4 to $5 a bale better off if their cotton went through one of Munger's systems, so they patronized the gins that used the Munger attachment. The factory was soon swamped with orders, more than it could fill, and needed more capital and facilities.

In 1887 the Munger Improved Cotton Gin Manufacturing Company was incorporated and a large plant erected at Dallas. Orders continued pouring in from all over the South, and it became necessary to have another plant, and this Mr. Munger decided in 1892 to establish east of the Mississippi River to save freight in serving that territory.

Birmingham was selected, and his brother, S. I. Munger, moved to Dallas from Mexia, and R. S. Munger went to Birmingham and organized the Northington-Munger-Pratt Company, and this later grew into the Continental Gin Company, with a capital of $4,500,000.

And, then, since his advent into Birmingham there is the story of how a gifted but impecunious musician was given the opportunity to study in Europe through his generosity, of how he gave Birmingham-South College $100,000, and $25,000 to Walker Memorial Church. In truth, there is no telling how many persons Mr. and Mrs. Munger have helped—only God and the Mungers and those who have been helped know.

To Munger wealth has not meant mere power, but a power to do good, to serve his community. The acquisition of wealth has not changed him. He is the same Robert S. Munger who conceived the idea of service to the raw-lunged, sore-throated victims of the lint and dust of the cotton gin. More money has simply meant a larger service, a greater responsibility, a broader possibility to him.

From the Prize-Fight Ring to Psychology

FROM a lowly lumberjack's cabin to the Harvard Graduate School with a prize-fighting career as his vehicle——

Once "slavey" in a camp boarding house; today seeker of the higher cultures——

Battering his way through 70 ring bouts until at the age of 42, he decides on a real education——

Those are milestones on the varicolored life journey of Frederick R. Wedge, of Arizona, who, to "leather-pusher" enthusiasts, bears the sobriquet of "Kid."

The piny smell of the forests imbued the lad with a fighting spirit, a spirit that found its outlet in knock-out punches, and general rough battling. Not to say that Kid was a bully. No; but the rough handicaps he met as a "slavey" made him a rough man—and when opposed he had to adopt the tactics of the time and place.

The most important traces of the olden days which remain with Wedge are three skull fractures—souvenirs of a yesteryear, which perhaps for excitement will outdo those of days to come in Harvard's classrooms.

Today he is getting ready to study the classics and psychology at Cambridge.

A slam with a poker in a saloon fight gave Kid his first broken head; the other two fractures were inflicted by policemen.

At 22, Wedge found that he had whipped everything in sight outside the prize ring, and decided to capitalize his fighting ability. Only three of the 70 prize fights he has to his record went against him.

Then into Kid's life crept the influence of a good woman. A university graduate, daughter of a doctor, she drew inspiration in the young man. Even before they were married he turned to better things.

Then began a fight—an uphill one. And the battle of education looked just as good from the center of the ring as the battle of fistiana.

The first step, perhaps, was his enrollment in a Wisconsin academy, where he covered 12 years of elementary education in just half the time. At 32, he was prepared for the University of Nebraska, where he remained for three years, being drawn away in his junior year by educational work.

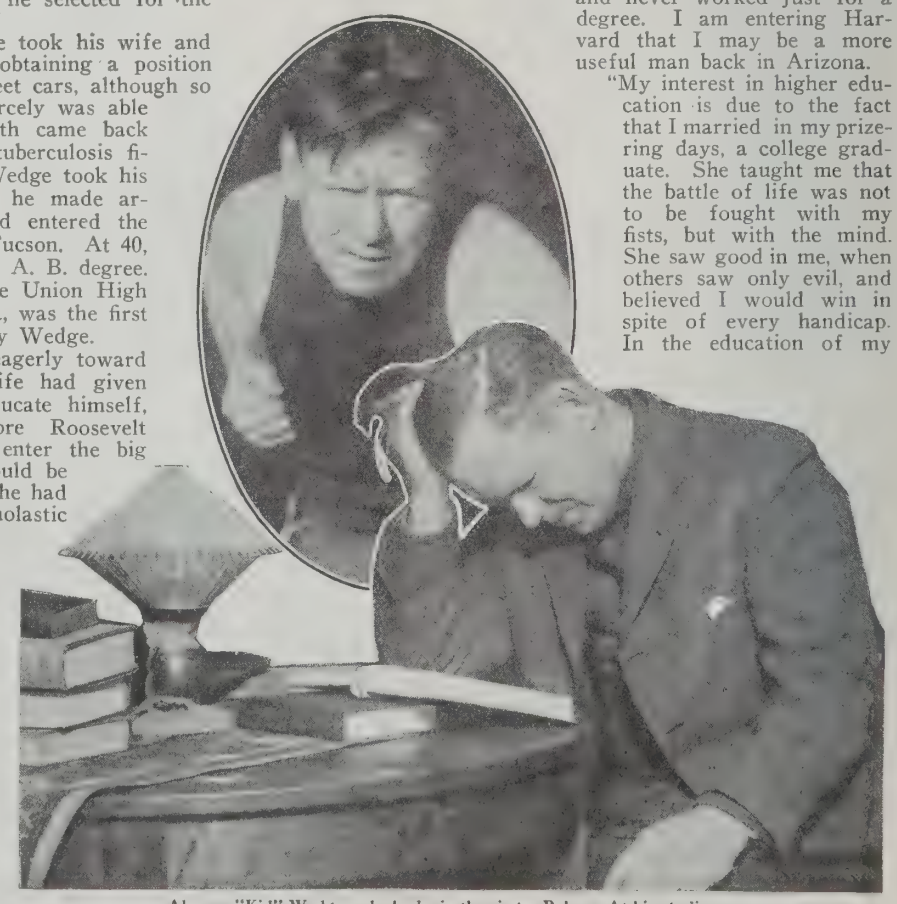
The war found him as boxing instructor at Camp Grant, Illinois, but after four months he was stricken with tuberculosis. "Six months more to live," the doctors told him—but they never counted 10 over his prostrate form. For to Kid it was just the sound of the gong again—a tap which sent him out to shake hands with death and taunt it with a whispered, "I'm here to stay."

El Paso was the place he selected for the fight.

Married at the time, he took his wife and son to Texas with him, obtaining a position as a motorman on the street cars, although so weak at times that he scarcely was able to walk a block. Strength came back slowly. The battle with tuberculosis finally was a victory and Wedge took his family to Arizona, where he made arrangements for a job and entered the University of Arizona at Tucson. At 40, the university gave him an A. B. degree.

The principalship of the Union High School, at Benson, Arizona, was the first educational position held by Wedge.

Then his eyes turned eagerly toward Harvard. Just as his wife had given him the inspiration to educate himself, the example of Theodore Roosevelt prompted him to try to enter the big university. Psychology would be the study—it was one that he had taken up during his scholastic first steps, and it will be studied deeply by him at Cambridge.



Traveling expenses are heavy these days, and Wedge decided to beat his way East, recently embarking in a side-door Pullman, with but $10 in his pocket. The 2,000-mile journey found Wedge in Cambridge with 36 cents left.

"I have chosen Harvard in preference to other colleges because of the higher educational requirements of the university," Wedge said, as he cleaned up after the ride from Albany to Boston.

"Why do I study the classics? In my undergraduate work, I studied Latin, Greek and Hebrew, in addition to the sciences. I was interested in the origins and excellences of man's intellectual achievements. In other words, I have never hunted for a snap course and never worked just for a degree. I am entering Harvard that I may be a more useful man back in Arizona.

"My interest in higher education is due to the fact that I married in my prize-ring days, a college graduate. She taught me that the battle of life was not to be fought with my fists, but with the mind. She saw good in me, when others saw only evil, and believed I would win in spite of every handicap. In the education of my son, I became interested in school teaching.

"My ideal for many years has been Theodore Roosevelt, a Harvard man."

Above—"Kid" Wedge as he looks in the ring. Below—At his studies.

If There Had Been No Sons of Preachers

Many Ministers' Boys Have Left Impress on the World

By W. C. POOLE

WHEN a minister's son steps from the "straight and narrow" it seems to be the custom to magnify the fact that the youth who committed the indiscretion, whatever it may be, is the son of a preacher. Thus a share of the public has come to believe that ministers' sons generally are bad boys. Are they better or worse than the average boy? The author of this article has investigated the question and quotes facts and figures to prove that the atmosphere of the parsonage is a mighty good place in which to bring up a boy. He doesn't deny that an occasional minister's son goes wrong, but he proves that the great bulk of them make citizens of the best class, and that a very large number have won fame and fortune. He cites the fact that three of the 29 Presidents of the United States were ministers' sons.

THE occasional bad son of a good minister keeps ever alive the old discussion of bad boys from the parsonage. No saying is more general anywhere than the much-repeated statement that sons of ministers are the worst in the community.

Just why ministers should have the reputation of making bad fathers, and their sons the reputation of being bad sons, is not clear. The records do not support the criticism. Whether it is because ministers are the most available subject for discussion, or because people expect them to have perfect lives, fit for examples to all; or because of the wonderful contrast between a good father and a bad son, the discussion will not down, but goes merrily on.

It is much easier to disprove the statement than to stop the discussion. The old statement that "Truth crushed to earth shall rise again" does not provide that it shall not be again crushed to earth. Moreover, the people who need the facts and the truth seldom get them. Error seems hard to exterminate.

The bad son of a good minister, and the ever-living critics of that son, started me to investigating actual facts and records. To make the work complete would take years, and volumes would be necessary to record the facts. Space here will only permit suggestions that students can follow in their own research.

The fact that we are just now trying to improve the human race, and, partially, if not completely, restore it to perfection of mind, body and soul, gives interest to this and every question relating to peopling the earth with perfect and desirable people.

I will not handle this question in a sentimental fashion. Sentiment has caused many troubles. Cold facts tabulated from enough cases to establish a rule or law are necessary. The evidence must not be biased. It must be so clear that all can follow and understand it. I wish to avoid, if possible, tiresome data which the average reader will not follow, and simply give the summary of facts.

Far Ahead in Presidential Race

WHAT ought we to expect in ministers' sons? Simply the average son of an average man. If he is more than that, give his parentage credit for extra fitness. What then should we expect in America as a whole? Approximately one man in every 300 men in America is a Protestant minister. Assuming that ministers have as many children as the average man, one boy in every *three hundred* is the son of some minister. Under this ratio we would expect

One President in every three hundred Presidents to be a minister's son.

One Senator of every three hundred Senators to be a minister's son.

One Congressman in every three hundred Congressmen to be a minister's son.

One governor in every three hundred governors to be a minister's son.

One author in every three hundred authors a minister's son.

One millionaire in every three hundred millionaires to be a minister's son.

To avoid confusion I have not figured the ratio to fractions, but the rule is so nearly correct that it serves better than confusing details would seem. Three out of 29 Presidents have been sons of ministers—Arthur, Cleveland and Wilson—almost one in every nine, instead of one in every 300, as we should expect. To place the ratio in terms of years, we have a right to expect a son of a minister to become President once every 300 Presidents or once in every *twelve hundred years*. Since the ministers' sons have furnished three Presidents already they will maintain an average if they do not furnish another President for *thirty-six hundred years*. These are cold facts and figures. Preachers' sons have won the race in the presidential class. Nor have I attempted to count the Presidents who were grandsons or great grandsons of ministers. To do this would take so many of the Presidents as to make the race uninteresting.

Some Notables Among Ministers' Sons

AMONG Senators, Congressmen and Governors the ratio is about the same, although it varies in certain periods of time. To attempt to name the sons of ministers who have served in the United States Senate or Congress is not the object of this article. The only two Democratic Presidents we have had since the Civil War were sons of ministers. Cleveland was born at Caldwell, New Jersey, where the house in which he was born is still well preserved.

Woodrow Wilson, the other Democratic President since the Civil War, was the son and grandson of a clergyman. He was born in Staunton, Virginia, just before the Civil War (1856). That these two men should have served two terms and been strong outstanding characters of their day would indicate that virile men can be raised in parsonages and manses and rectories.

To name the leaders of the Puritans, is to name the ministers. Some of the founders of colonies were ministers—among whom were Roger Williams and William Penn. To name the sons of ministers among the early settlers is to name the foremost among the leaders. Every one who has read the list of signers of the Declaration of Independence will never forget the bold writing forming the name of John Hancock—the first signer. Hancock was a minister's son. Henry Clay, who did much for his country in the first half of the nineteenth century, was a minister's son.

Among the makers of America no family has furnished a single crop of three children who have stood higher in America than the Field family. The Rev. David D. Field was a preacher of Stockbridge, Massachusetts. Three of his sons were:

1. David Dudley Field (1805-1894), jurist and compiler of law codes.

2. Stephen J. Field (1815-1899), Justice of the Supreme Court of the United States.

3. Cyrus W. Field (1819-1892), who gave us the Atlantic cable.

That brings up the question of families of clergymen. Does greatness and ability increase with each generation? Henry Ward Beecher was the son of Lyman Beecher, a minister. John Wesley and Charles Wesley were sons of a minister. These men have left the imprint of their leadership on the world for centuries to come. Bishop E. H. Hughes, one of the most brilliant church leaders of today, and his equally gifted brother, Bishop Matthew Hughes, were sons of a Methodist circuit rider out in the mountains of West Virginia a half century ago. Bishop John Hamilton, now chancellor of the American University at Washington, was the son of a Methodist preacher, as was his brother, Bishop Franklin Hamilton, who died in Pittsburgh a few years ago, shortly after his election to the episcopacy.

A genealogical table of the Woodbridge family can be traced to 1493, and in 14 generations there is only one which did not produce one or more ministers. There seems little doubt that this family for 400 years has been like a fountain of living water, ever helping the world to bear its burdens and do its work.

One in Every Ten Is a Leader

E. H. HARRIMAN, the multimillionaire railroad magnate is reported to have said that once when he was the hungry child in the family of a poor preacher, he promised himself he would have everything he wanted when he became a man. If he did not get everything he wanted in later life it was because shrewd brains and $100,000,000 could not get it.

In Wilmington, Delaware, it was my pleasure to know of every leading banker. At that particular time, some 10 years ago, six of them were grandsons of a Methodist bishop. I cannot get a correct list of all the millionaires in America, but it is my impression, formed from a very incomplete list before me, that one in every 10 is the son or grandson of some minister.

And please do not forget that we are to look for only one in every 300 persons in every prominent class to be the son of a minister, whereas we are finding one in every 10; that is, sons of preachers produce 30 prominent leaders where we should expect only one, as compared with the average home.

Lest it might be claimed that the above facts are not full enough and complete enough to establish a law, Who's Who, telling us about leading Americans in literature, science, government, finance, and so on, contains nearly 20,000 names of leading Americans. The study of an old edition of 12,000 names showed approximately 1,000 as sons of ministers. This is perhaps the best general authority on the subject we have. I have not had time to tabulate and make count of all names in the latest and largest volume, but such work as done still shows about the same ratio as among the Presidents—one in 10, where we should expect only one in every 300.

I stopped trying to find why so many sons of preachers fail as compared with sons of other professional leaders and began trying to find why and how they succeed so well. Possibly the minister chooses a thoughtful mother for his wife. Possibly self-denial in the average preacher's home teaches the child resourcefulness and develops initiative and character. Perhaps the spiritual atmosphere gives vision and courage. Perhaps it is all of these and then some other things, but the sons of ministers succeed better than any other class of children.

What is the quality of these sons of preachers? Their number outclasses all others. Is the quality maintained? New York in 1920 furnishes part of the answer:

Thomas W. Lamont, the financier, was a minister's son.

The editor of *The Literary Digest* was a minister's son.

Two of his associate editors were ministers' sons.

Lyman Abbot is a minister's son, and two of his sons are sons and grandsons of ministers, and the list might continue if space permitted. I need not mention such men as Henry Van Dyke, William James, Henry James, Richard Watson Gilder, Oliver Wendell Holmes, James Russell Lowell, Francis Parkman, Louis Aggasiz and others, some of whom have finished their work and are dead. Nor need I call attention to one of the foremost figures today—our Secretary of State—Charles E. Hughes, who is the son of a Baptist clergyman. Are these men just space fillers? Do they hold their jobs by mere favoritism? They were not born with the prestige of wealth or powerful influence. Each has had to climb the ladder to the place attained by sheer ability.

Let us look over other years. Linnaeus, the great botanist was the son of a minister; Jenner, who gave us vaccination against smallpox, was the son of a minister; Sir Christopher Wren, the great architect, was the son of a minister; so was Sir Joshua Reynolds, the great artist; Hallam, Froude, Charles Kingsley, were all sons of preachers.

A whole line of poets were sons of preachers. Tennyson, Ben Jonson, Cowper, Goldsmith, Coleridge, Addison, Young, Keble, Matthew Arnold and others, were sons of preachers.

What the Sons Think About It

EIGHT out of the first 37 names selected for the Hall of Fame in New York City were borne by sons of ministers, when only eight in 2,400 should have been expected.

What do some of the sons of ministers themselves think? In 1911, when he was governor of New Jersey, Woodrow Wilson was quoted as saying: "I believe that to be the son of a minister has been in a great many ways a distinct advantage to me. To be the son of a minister generally means the association throughout one's youth with a man of character and cultivation devoted to the highest things both of thought and action, and that must surely constitute a great advantage."

Dr. John H. T. Finney, one of the foremost physicians of Baltimore at that time and whose father and grandfather were ministers, is quoted as saying: "There is no doubt in my mind that as the twig is bent, so the tree is inclined. In my own case, I have frequent cause to be thankful that the training I received from my father was what it was. It is a good thing at times to have one's moorings pretty firm, and I think the training which the majority of children receive in a minister's family is better than that found in the average family circle. I know I was exceptionally fortunate in my own father and I shall never cease to be grateful that I had the benefit of his training during the years when it was most needed. I know whatever success I have obtained in my profession has been due more to his influence than to any other."

These two opinions, given by two great thinkers, in their respective lines, need no additional support. They are typical of opinions from others who have been successful—although sons of ministers.

In almost every case the mother in the parsonage comes in for even a greater commendation than the minister himself. Her devotion, ideals, self-sacrifice, self-denial, courage, patience, faith—all enter into the giving a minister's son a 30-times' better chance to succeed than the son of the average man.

Some of Their Achievements

BUT what have ministers done? Still the question arises, are ministers good for something or just good? Suppose there had been no sons of ministers.

Would we have the telegraph lines of the world—or even a Thomas A. Edison, who as a telegraph boy began his wonderful life, giving the world the many things without which it would fare badly? Was it not the telegraph lines given us by S. F. B. Morse, a minister's son, which awoke Edison and started him on his marvelous career? Would we have the great ocean cables given us by another minister's son? Would the news of Europe each day be spread on our supper tables? If it had not been for the bold John Hancock, and sons of other preachers, would we have the United States of America?

Would there be any Methodist church if it had not been for two sons of a preacher in Epworth rectory? Who can measure the fruits of this influential church? The great hymns of comfort and courage and battle and warfare are with us because of a son of a minister. Would there have been any soul-winning, soul-stirring, soul-saving evangelism in the churches?

More than half of our best books were given us by sons of ministers. More than half of our college and university presidents are sons or grandsons of ministers. How would the world fare without Tennyson's "In Memorium" or Wesley's "Jesus Lover of My Soul," or so many things which have become a part of the best ideas and ideals of the world. If there is a black sheep sometimes, like Judas Iscariot among the 12 disciples, the facts stand out that a minister's son has 30-times' more chance to succeed than the ordinary boy.

Getting Together—A Remedy for Industrial Ills

Employer and Employe Must Co-operate

By JAMES J. DAVIS
SECRETARY OF LABOR

(C) Harris & Ewing

JAMES J. DAVIS,
Secretary of Labor.

THERE are always just so many individuals who must be pessimistic regardless of the signs of the times. There are still a few persons who receive the information that the United States has passed the lowest point on the road to normalcy with a question mark. A year or even six months ago there were more pessimists than now—which goes to prove that the industrial machine which has been coasting down the road of depression has felt the inspiration of the hand at the throttle and is picking up headway on the upgrade. A little more "gas" of enthusiasm, of confidence, and the gears will be shifted into high with such ease that many will wonder why they ever doubted.

The work to be done is to improve the present situation. In these stern times we have learned a new conception of work. Work means something more to us than working for ourselves. We see that to prosper, ourselves, we must work for the general good, for the other fellow, for the millions of other fellows, which means the nation.

Anybody can, and must, take a hand. The business leader must work to start the wheels of industry going again, and bid farewell to war-time profits. The toiler must work among his kind, for the creation of a spirit willing to bid goodby to unreasonable demands. The banker must work to provide credits for the re-establishment of business. The skilled engineer must work to cut down costs.

All Can Help Start Things Going

THERE happens to be some general contributions that all can make to start things going. With all due respect for prudence, people should buy all they can to satisfy their immediate needs. Employers should stop trying to crush labor organizations. Labor organizations should buckle down to sensible wages and postpone contentions over wages and working conditions to a better time.

Any one who speaks on the affairs of the nation expresses himself now with cheerfulness and confidence. To realize what this means we have only to transport ourselves back the short stretch of a year and reflect where we were at that time. To emphasize our improved fortunes now, let us consider the picture then. There is no disguising the fact that it was a time of discouragement and uncertainty. Men in the strongest positions shook their heads. The wisest were unable to predict what would happen.

Still, serious as the times were then, as is natural with our people, we greatly exaggerated our unhappiness. We are a people who like to look facts in the face. We demanded to know the number of unemployed—and the number frightened us. We forgot the fact that at all times in our country, even in the best of times, there are always about 500,000 men out of work, either from choice or because of shifts in the population. Our plight in that respect was not so bad as we thought.

In the 55 years since the Civil War the United States has made one of the most astonishing leaps forward in human records. In that half century it has taken its place at the forefront of all others as a producing nation. In the whole past history of human endeavor there has been nothing like this rapid rise to wealth on the part of a whole people. Since the recent great war the gap between us and our nearest rivals has, if anything, widened. In that war our resources of machinery counted as much as our men in the tide of victory. Nothing has ever equaled the magnitude of that performance. We literally made an era.

In the year 1919, on the heels of the war, we kept 287,000 manufacturing plants in operation, some of them night and day. With the skill of their 8,000,000 employes a product was turned out valued in that year at sixty billions of dollars. Early in the boom year of 1920 we did even better. Yet a year afterward we dared to be downhearted. A people capable of such endeavor has been almost in despair for months, doubting its ability to recover from the effects of its own discouragement.

This country has performed the marvel of self-cure before; it can and will do so again. But there are shocks yet to come. From a period of depression such as that which existed in 1921 we cannot rise on wings and by means of a mere wish. American business is as a being sick. Its recovery depends upon its own iron constitution. There is no magic cure for its malady.

The administration at Washington has been looked to for some magical way out of the maze. But President, Cabinet and Congress are not performers of miracles. Recovery will be slow and gradual. There will for a time be continued unemployment. This will mean discontent among those who are kept out of work. Their temper will be tried, as their endurance has already been tested.

Now it is possible, as I have said, to speak of the immediate future with cheerfulness, with confidence. The crisis is past. The processes of readjustment are well along. Wholesale prices have fallen. Retail prices are following, not so fast as many of us would wish, but probably as rapidly as sound conditions will allow.

The most unwelcome of all situations has been the prospect of a reduction in wages. The balloon of inflated war-time prices having collapsed, values dropped to earth—even the value of labor. It has always seemed to me the saddest fact in life, that human labor, the work of human hands, should be subject to the laws of the market. Yet it must be so. The value of work and the product of work must rise and fall together.

Some Would Cling to Old Prices

ADJUSTMENT and return to prosperity were halted or delayed because everybody was trying to beat down everything except his own income. So, many of us, especially the men without work, have had to suffer while the process of a lowering of costs all along the line works itself out. At points that lowering process is being impeded by groups who want still to hang on to the old prices. As a people we have cried out for these adjustments, but the process cannot move faster than the great mass of us moves and thinks.

As a matter of fact we are fortunate to feel the improvement so soon. In similar crises in the past, recovery has been much slower in coming. And we must not expect, we do not want, a sudden rush back to boom times. It is better for the return to be sure. I believe the American workman has made up his mind to wait solidly for prosperity. He can wait; he will wait.

Our greatest lesson has been learned. It could not be taught us until we had gone almost to the limit of our endurance, and we had to wonder whether there would be bread in the bread-box tomorrow. It was the lesson of thrift. Everywhere you go you can now see the carefulness of men and women in buying. The mind of the public has begun to think in terms of homes. People are realizing the foolishness of paying rent, and are asking for homes of their own. They need good honest work to do, and are willing to do it, where a year ago there was a tendency toward the finicky. The American standard of living is the best prop and stay.

It is next to impossible to define in so many words what we understand as the American standard of living. As I see it, the American workman wants to open every week a pay envelope permitting him to save toward a comfortable home, and then to maintain that home in security. He wants enough to clothe his family decently, and to send his children through the grammar schools at least, and if possible through the high schools. Beyond that he must have enough to lay something by for his later years.

What the Average Workingman Wants

A COMFORTABLE house, as I picture it, is one that will keep the children at home because they would rather be there than anywhere else. I see in that home a table supplied with plain but good food in sufficient quantity. I see it simply furnished, with some pictures and some books and a musical instrument.

The laboring man who does an honest day's work does not require very much to make him contented. He hasn't the time for many recreations. He can't afford elaborate entertainments. But he is entitled to some outside pastimes. To follow his standard of living outside his home, the workman expects a wage that will leave him a modest sum for entertainment and self-improvement.

In normal times the average American workman receives all this and counts it as his due. Of course, a man without thrift can receive enough for these things and still have nothing. But the bulk of our people are thrifty, and so many thousands of them do own such homes and lead such lives that we have come to take those lives and homes as the standard of American living.

We should never lose sight of the fact that the American workman has given of his very best to help achieve our amazing national development. He deserves the best in return. Everywhere the far-seeing among our employers have come to appreciate the full measure of the workman's deserts. A living wage, yes, but even that is not enough. We need to think of him more as a man, as a co-partner in business. The humblest workman appreciates recognition.

I believe we are to work a new era in the world's progress by applying our national genius to the human side of industry. We had been making our country one vast machine by intense application of a genius for the *mechanics* of industry. Now has come the realization that all our industrial ills have sprung from lack of a single cog in that machine—a single cog, but the most important of all. The missing cog has been the element of simple humanity. Now, with our characteristic energy, we are hastening to supply that element—the *humanics*.

During the war we thought entirely of what we could get. It brought us disaster. Now we see that the way back to prosperity is to work back. We must think of what we give for what we get. The worker owes it to himself to work. This is no day for loafers. The man who doesn't earn his pay should have no pay. I am opposed to the rich loafer and the poor loafer.

Clean Out the Shirkers, He Advises

I HAVE this to say to my fellow trade unionists: If you want to make progress in America, you must clean your house of shirkers. Let the trade unionist say: I will not work with shirkers who, in robbing their employers, are robbing all the rest of us. We want to make our trade union badge a symbol of an honorable man who does an honest day's work. I mean that badge to be a badge of pride. I want my trade union card to be honored like the doctor's diploma.

If unions understood this spirit more fully antagonism to the unions would die a speedy death in the camps of its bitterest enemies. No criticism visits the man who works. If the unions *demanded* of every member a certain reasonable measure of daily work—if they fined or fired the shirker—I can see the day when every employer in the land would hail the nearest union leader and say: "Come, unionize my plant."

Another great lesson we have learned, I hope, is the lesson of working together, all of us, all the time. If so it would be the new discovery of an old principle—the principle of responsibility. As never before employers and employes have learned that their interests are one and the same. Neither can get along without the other. The two together prosper only as the employer is fair to his workers and as the workers give an honest day's work for a living wage. But above all that, their temper must be right toward each other.

Only the Dark Side Published

THE trouble is that harmony seldom advertises itself. Strife alone does that. The great body of American industry does move forward harmoniously, with concord between those who have saved and prospered and now own factories, and those whose ownership of a clean pair of hands will lead to ownership of factories if they likewise toil and save and use head as well as hands. That harmony we hear little of because of the noise of occasional industrial strife among us. But the music of factory whistle, the music of the humming wheels, the music of the whirring saw, the drumming of the riveter, grinding out products which mean wages and reasonable profits, is written in that harmony between employer and employe.

The great pity is that we hear so little of this in the newspapers. We have no guide to their numbers. We hear mostly of the controversies and disputes in industry. We get the impression that nothing else is going on in our country. We take these disputes to be the rule and not the exception.

It was my aim, on becoming Secretary of Labor, to utilize to the fullest extent the influence of that public office to spread as widely as possible the gospel of harmony between the worker and his employer. The Conciliation Service of the department has had many difficult cases presented for mediation. In scores of smaller cases speedy adjustments were obtained, although unemployment conditions and business depression resulted in many long-drawn-out disputes. Hundreds of thousands of workers were directly or indirectly involved. How many millions of dollars of loss were saved by these adjustments we have no means of knowing. How much disturbance and irritation we saved the country by ending these disputes we also have no means of knowing. But if figures are an index of anything, they prove that the practice of fairness and a spirit of conciliation has been immensely worth while.

The willingness toward harmony and mutual concession on the part of our people, worker and employer alike, needs cultivation. It must be encouraged.

LIGHTENING LABOR on the FARM

The tractor does more than fit the soil for planting. It is an important factor during haying. It helps to take the rush out of the harvest season.

Sawing the winter's wood is not the task it used to be. This farmer, with a pulley and belt attachment, makes good use of his tractor.

The undergrowth here provides a good test for the tractor's power. And the tractor readily breaks land like this—to the farmer's delight.

The old-fashioned steam thresher is fighting a losing battle with the tractor. The average farmer finds this method economical and reliable.

Making good speed and doing a clean job, this two-plow tractor is performing one of its most important functions.

The tractor is working five times as fast as the horses and the farmer's part is made much easier.

THE LIBRARY OF THE UNIV. OF ILLINOIS URBANA ILL

BRIEFLY TOLD

Trackless trolley systems have been in use in China for some time.

Applications for telephones in Tokyo sometimes wait years for filling. Three hundred and fifty persons who applied for telephones in 1907 have just been granted them.

A European inventor asserts that he has constructed an electromagnetic phonograph on the combined principles of the amplifying tube and the telegraphone, by which a message may be "spoken into" a rail and picked up by the engineer of the following train.

If a public official of England gives out, without proper authorization, information obtained in the course of his official duties, or utilizes it for private purposes, he becomes liable to criminal prosecution.

Approximately 150,000,000 pounds of beef was produced on the ranges of national forests in the inter-mountain region during 1921.

Pocket telephones of the wireless variety will be part of the equipment of every policeman in Chicago soon. It will then be possible for policemen to be in communication with headquarters at any moment without the necessity of reporting in at the patrol boxes, as at present.

The original put-and-take top is to be seen in the museum of archeology and paleontology, University of Pennsylvania. This top was found in Korea and is a three-sided top marked with notches instead of figures. This top was used thousands of years ago, as was the old Chinese top, a prismatic die top called the ch'e me. The Hindoo counterpart of the put-and-take top game is called the chukree.

One thousand two hundred eighty-one Japanese women entered California during 1921.

Harney Peak, in the Black Hills, is the highest point in the United States east of the Rocky Mountains.

Motion picture films as a means of promoting trade in foreign countries are to be tried out extensively in the near future by the Bureau of Foreign and Domestic Commerce of the Department of Commerce.

Iron salts are being used for tanning, and manufacturers have begun to prepare iron tanning extracts on a commercial scale.

A big Brazilian cocoanut palm in the New York Botanical Garden grew so fast that several times it poked its head through the top of a conservatory, 90 feet high. To prevent further damage the tree was cut down.

"Jewish Influence on American Life," Volume III in the series on "The International Jew," comprises a third selection of articles on the Jewish Question, and is now off the press. It contains 256 pages, and will be sent for the cost of printing and mailing, which is 25 cents.

"The International Jew," Volume I, and "Jewish Activities in the United States," Volume II, 235 and 256 pages, sent for 25 cents each.

Paintings by well-known Russian artists in some cases are selling in Moscow for the price of a pair of shoes.

Walnut slabs on which were beautifully and delicately carved passages from the Buddhist holy book were uncovered by workmen in the province of Chihli, China. The slabs were centuries old, and the natives were using them for kindling.

New York now has more than $11,000,000 available for building roads in that state.

Japan's salt supply comes entirely from sea water, which is drained on artificial marshes.

A Paris physician, who has for many years studied Egyptian mummies, believes he has discovered an embalming fluid that will maintain a lifelike appearance in corpses for more than 20 years.

The crocodile has a gizzard which it uses to crush and grind large lumps of food. It takes in sharp-edged stones to help in the grinding process.

More desks, flat and roll top, are manufactured in Herkimer, New York, than in any other place in the United States.

A prize of $100,000 has been offered by Lord Atholstan, of Montreal, for the discovery of a cure for cancer within five years. Sir William Veno, of Manchester, England, has offered $50,000 as a supplementary prize for the same purpose. The Royal College of Physicians and Surgeons of London is to judge the formula, if any cure is found.

Dropping nearly 100 feet over a cliff into a 15-foot snowbank, a New Jersey man was dug out and found to be unhurt.

A "bone-dry" zone extending 40 miles inland along the full length of the Mexico-California border soon will be proclaimed by the Government of Mexico.

Every man and boy in Breathitt County, Kentucky, volunteered for service when the World War came.

An automobile driver may run full tilt into the latest model of railroad crossing gate, recently installed in Chicago, without injury either to himself or car. The gate will gradually yield and will halt the car just short of the track. A system of weights and coil springs exerts braking pressure.

Officials of London have decreed that children under 16 shall not see certain motion pictures unless accompanied by parents or guardians. There are two classes of films that are passed by the British board of film censors. One class is passed for "universal" exhibition and another for "adult" exhibition only.

Airplanes in the California rice fields ward off the flocks of wild ducks that come down from the North each autumn to feed on the grain.

France has six living soldiers who are unknown. Their memories are a complete blank as the result of the horrors of war. Photographs and detailed descriptions are to be given metropolitan and provincial newspapers in an attempt to locate their relatives.

The cottage where George Pullman dreamed of sleeping in comfort while traveling still stands in the shadow of the Rockies near Denver.

The daily number of motor accidents in Paris is approximately one hundred.

A film of ice formed on an arm of San Francisco Bay during a recent cold snap. Irrigation ditches froze over and snow flurries occurred near Los Angeles.

A new type of examination for college students is being tried out at Columbia University. Instead of a few questions on the high spots of the course, the new examination consists of a number of statements concerning matters previously gone over, some of which are false and others true. The student makes a plus sign next to those he considers true and a minus mark beside the false. This affords no chance for the bluffer to exercise his art, as two-thirds of the examination consists of the new method.

There are approximately 14,000,000 foreign-born living in the United States, and more than 7,000,000 cannot read the English language.

GOLD HAS DROPPED OUT OF CIRCULATION

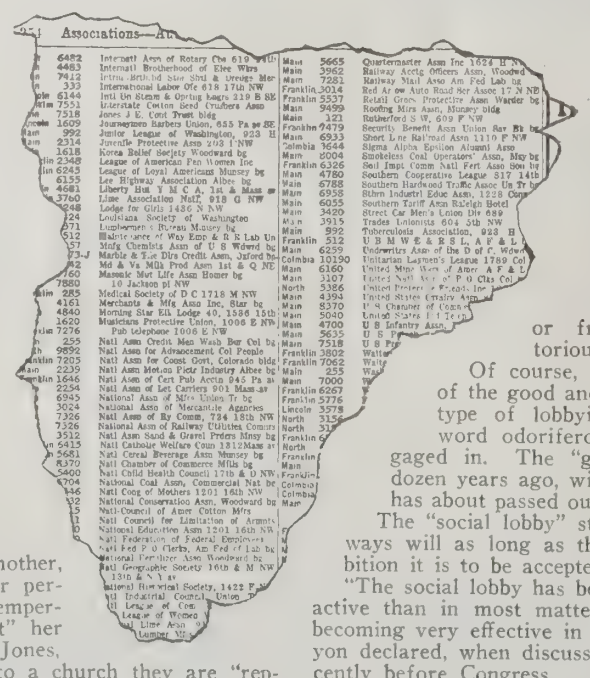
Our Assistant Government in Washington

TROOPS AND TANKS WIN LAW AND ORDER

Our "Assistant Government" in Washington

Many Organizations "Represent" Various Activities and Seek to Influence Laws

". . . . If the rich, in any modern state, thought it worth their while to secure a tariff, or legalize a trust, or oppose a confiscatory tax, to subscribe a third of their income to a political fund, no corrupt practice act yet invented would prevent them from spending it. If they did so, there is so much skill to be bought, and the art of using the skill for the production of emotion and opinion has so advanced that the whole condition of political contests would be changed for the future. No existing party, unless it enormously increased its own fund or discovered some other new source of political strength, would have any chance of political success"—Graham Wallas, the English psychologist-politician in "Human Nature and Politics," the most thorough study ever made of the subject.



By AARON HARDY ULM

WHEN John Smith, ordinary citizen, says, "I am represented in Washington," he has in mind his congressman or his senator or perhaps officials in the executive departments or bureaus. But when Felix X. Jones, another citizen, says, "I am represented in Washington," he does not refer to those officials elected by him or who are paid from the public treasury. He has in mind a representative or representatives hired by him or for him and paid as his clerk or his traveling salesman or his farm hand or superintendent is paid.

Let us assume that Felix X. Jones is a storekeeper in a country town in Kansas. The town has a Chamber of Commerce which Jones helps to support. The chamber in turn is a member of the United States Chamber of Commerce, which maintains in Washington a big establishment for "representing" Jones in matters of general business concern.

If he sells dry goods, Jones may be a member of a national association which likewise "represents" him in Washington as far as national affairs affect that item of his business. If he sells hardware, there is another association which attends to that. If he sells automobiles, there is another, or if he only owns an automobile there is still another which "represents" him.

He owns stock, let us say, in a local bank which is a member of the American Bankers' Association, which, through its Washington offices, "represent" him in his banking interests. His bank probably is a correspondent for a big New York bank or trust company, which likewise maintains in Washington capable men to help keep Jones advised about matters affecting the banking interests.

Out in the country, Jones owns and operates a farm and by reason thereof he belongs to the local farm bureau. Thus through the American Farm Bureau Federation his farming interests are "represented" in Washington by a big establishment. They may be represented additionally by the Farmers' Union and several other agricultural organizations which maintain Washington establishments.

Mrs. Jones likewise is "represented" by at least a dozen organizations. One "represents" her as a mother, another as a voter, another perhaps as an advocate of temperance, and others "represent" her children. If Mr. and Mrs. Jones, or either of them, belong to a church they are "represented" in that capacity by the Federated Council of Churches. Several church denominations maintain separate or additional Washington establishments.

One might figure out how a family like that of Felix X. Jones has not fewer than 50 "representatives," which function in the form of associations, federations, leagues, and so on, with offices and usually paid agents at the national capital.

The Joneses probably are entirely unaware of the fact that they are so numerously "represented" outside of and "to" the Government at Washington. They may actually be members of none, or only a few of the organizations, which "represent" them. But whether they are members or not, they are counted by many of them, and are counted over and over again—and often in ways that are contradictory. The "three tailors of Tooley street" who met in London and began the preamble of a memorial to the king with "We the People of England" set the pace for the average Washington representative of groups.

Recently I asked one who has long been such a representative for an estimate of how many persons are actually thus "represented" in Washington.

"Certainly a great many more than are in the country," he answered, laughingly. "Scarcely one of us claims to represent fewer than a million; some of us claim millions."

But while the millions are represented numerously and variously in that vast unofficial structure, which one who helps manage it has called the "assistant government," they are by no means the best represented.

The best represented are small groups, or what frequently doesn't come under the classification of groups, being more in the nature of things than people. They are denominated usually as the "oil group" or the "railroad group" or the "banking group," or the "manufacturing group" or the "fertilizer group." Frequently their Washington establishments rival even the big governmental bureaus in size and cost and activity. Their chief agents almost invariably are paid much higher salaries than are received by congressmen or senators or cabinet officials. Many belonging to this classification are represented individually as well as jointly with others in the same line. Most of the big corporations have their Washington representatives whose business it is to look after the interests of their clients in legislation and administration.

All, whether there for big groups or small groups or no groups at all, deal in some kind of propaganda. The word is used here in its broad and inclusive sense, and not merely in the restricted and invidious sense given it by the war. There can be good as well as bad propaganda, and much of that which is dispensed in or from Washington is meritorious if not commendable.

Of course, there is lobbying, too, both of the good and the bad varieties. But the type of lobbying which once made that word odoriferous is now rarely ever engaged in. The "glad-handing" lobbyist of a dozen years ago, with his bottle and his boodle, has about passed out of the Washington picture. The "social lobby" still cuts a big figure and always will as long as there are persons whose ambition it is to be accepted by the socially elect.

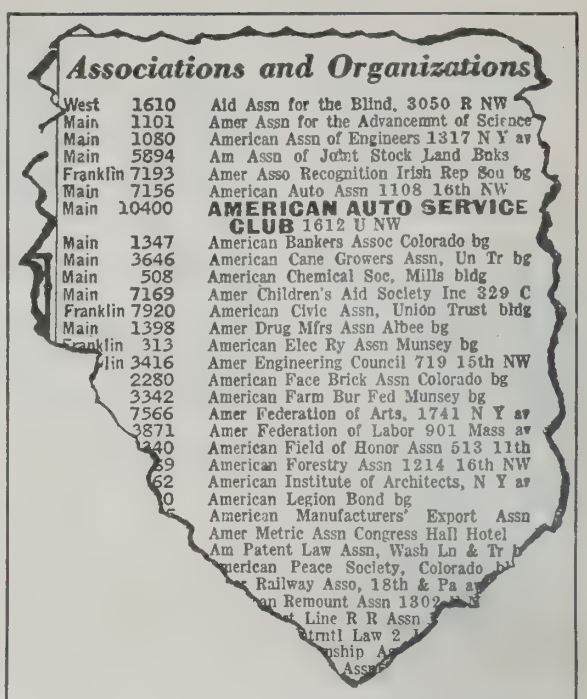
"The social lobby has been active in this case, more active than in most matters; and the social lobby is becoming very effective in Washington," Senator Kenyon declared, when discussing an important matter recently before Congress.

"Lobbying of the old type no longer gets anywhere," said an old-time lobbyist, who made a fortune out of it, to a prospective client recently. "However, unless a measure has big popular demand behind it the odds are much against its being voted on unless some one makes it his business to prod the committees and the members concerning it. Now, I play golf nearly every week with the chairman of the committee which has your bill in charge. . . ."

To be able to play golf with congressional leaders or big officials in the executive branches of the government is a big asset to an outsider in the "representing" business, if he wishes to use it; and many do.

There are in Washington more than 2,000 lawyers. A large proportion of them are engaged in legislative or "departmental" practice. Very little of it calls for knowledge of the law, for many persons who have no law diplomas or certificates engage in it. Better than any kind of knowledge is wide and intimate acquaintance in the right circles. Many Washington lawyers deal in propaganda of some sort. Many have standing retainers from interests concerned with legislation, as well as with the income tax or other administrative matters.

The quality of the work done by some may be indicated by partnerships or office associations that exist. A prominent Republican lawyer frequently associates himself with a prominent Democrat. One law establishment in Washington is conducted jointly by two men, one of whom was formerly an official of the Democratic Congressional Committee, the other having been connected similarly with the Republican Congressional Committee.



Much of the fee business going to Washington lawyers or other persons who engage in departmental and legislative activities on the basis of fees is due in part to misapprehension about affairs in Washington. A business man far from the national capital often will pay real money for something that only appears to be "inside." Any one familiar with the machinery of the government can find out almost anything that is to be known. Yet many large sums are paid for "tips" that a properly directed letter from anybody would bring forth. Those who get out regular "information" services—there are several which send out daily reports on what is going on in various ways—find the word "confidential" to be of great value. There's a certain man, for example, who has made a great deal of money out of business bulletins sent to large numbers of subscribers who pay liberally for them. He uses fine paper and excellent printing in getting them out and bespatters them with the word, "confidential." They thus make a great impression, though they rarely contain anything anybody can't find out. Fees of $500 to $1,000 are often paid for getting passports that could be just as easily procured without the aid of a go-between.

It would be interesting to show, if there were some way of computing it, the cost of so-called "assistant government" in Washington. A large portion of the population is now taxed just as regularly and as surely for unofficial representation as for the official kind in Washington. It is becoming just as necessary for those who have just causes as for those who have doubtful causes.

This is shown by what several of the farm organizations have been able to accomplish for their members through maintaining Washington establishments. The achievements of the "farm bloc" are due as much to the farm leaders who have marshaled their followers behind it as to the members of Congress who compose it. Those leaders organize and keep up the public sentiment without which the "bloc" would soon go to pieces. The "research" men in the Washington offices of the farm organizations dig up the information the "bloc" leaders need in presenting the farmers' claims in Congress.

The same is done by interests opposed to the proposals made by the farm organizations or the "farm

(Concluded on page 12)

THE reproduced slices from the Washington telephone book give some conception of the "assistant government" structure that has been built up in Washington. Under "Associations and Organizations" there are listed more than 200 establishments which are conducted ostensibly to "represent" groups, interests, commodities and ideas concerned with national legislation or administration. These, however, are open establishments, whose operations as a rule are public. But there are many "agencies," like resident "attorneys"—who are not always lawyers—that are not so listed with reference to what they "represent." Most of us are "represented" in or by the Washington "assistant government" in some way—often many ways—but some are much better "represented" than others. Of course, all the associations and organizations in Washington are not maintained to represent, and in reproducing the lists such is not meant to be stated.

Guam, Uncle Sam's Far-flung Outpost in the Pacific

Island Possession Has Been Little Developed, But Possibilities Are Great

By CARL SCHURZ LOWDEN

"RIGHT this way, ladies and gentlemen, to Guam and the Carolines. See Uncle Sam's far-flung outpost, the last stopping point on this side of the Philippines. Transfer at Guam and go south to the Caroline Islands. These are the spoils, or a part of them, that the Japs got for fighting against Germany. See Yap, little in name and size but mighty. Japan has a mandate over it, but our cable to the Philippines lands there. There are hundreds of islands in the Carolines. See what the Japs are doing there. See with your own eyes whether they are abiding by the four-power agreement to cease building fortifications. Right this way, ladies and gentlemen."

The ballyhoo man, the "barker" in the red cap, can be imagined or visualized as standing at the dock in San Francisco and exhorting his hearers to go West. But this young Horace Greeley can only be imagined. He wears no red cap; in fact, he is not there. If he were there he would be shouting the wonders of Hawaii. That place is established in the American consciousness. We have acquired the habit of going there.

Guam, still largely undeveloped, is only a diamond in the rough. Yap is just a pinpoint on the map. The Carolines are just half a thousand pinpoints. However, Guam has a length of 30 and a width of six or seven miles with a total area of approximately 200 square miles. It is a stopping point for Uncle Sam's transpacific ship route and one of his cable lines. He has also there a naval depot and some fortifications not yet finished, but as much finished now as they will be within the next 10 years if the *status quo* understanding of the powers lives.

Guam is hot; its mean temperature is 80 degrees. When it rains, it pours. When it blows, look out for a hurricane. When the ground shivers and you have a strange feeling of emptiness or uncertainty, you may know that old Mother Earth is quaking.

Hurricanes make no lasting impression on the natives. A furious storm destroys the fields and gardens, wipes out everything. The people are destitute and famine grips them. It has happened several times. Some ship comes in with food, and starvation is prevented. The farmers grow just enough vegetables for their daily needs. They never have a surplus; when disaster arrives, they are not prepared to cope with the emergency.

The situation may be peculiar but not entirely illogical. There must be an incentive of a positive character. Here in America we grow more than we need so that we can sell the surplus and buy other materials with the money received. Guam is isolated. There is no market for the surplus. The wants of the people are extremely simple. The only possible need of a surplus would come with a catastrophe. The people are unwilling to anticipate a calamity, particularly so if two birds cannot be killed with the same stone.

Guam is not self-supporting, though every home has its garden or rancho, where the principal products are corn and sweet potatoes. Perhaps there will be a patch of tobacco or some coffee bushes stooping from the weight of the berries. Rice is grown. Cocoanuts are gathered from the palm trees. Copra, the dried meat of the cocoanut, constitutes the only item exported. By far the larger part of the population of 15,000 is engaged in agriculture.

The roads are poor, many of them little more than mere trails. Even the carabao, or water buffalo, and the cart it draws cannot travel some of them. This need for better transportation retards the development of the island. When roads are made, fine lumber obtainable in the interior and other materials besides copra will doubtless be exported.

The natives are a picturesque lot of mixed blood, with a range of complexion from white to dark brown. In other days Scotch, French, English and Spanish ships stopped in the harbor of San Luis d'Apra. When the ships departed, some of the men remained and married the native Chamorro women. If the tourist were required to guess or identify the place by the family names he would judge himself to be in the British Isles, France or Spain; if he heard the language and knew languages he would perceive it to be the common tongue of that section of the world; that is, of Micronesia.

The men wear trousers and shirts, but they vary the American style by keeping the shirt entirely on the outside. We may laugh at the custom, but they deem it a much more preferable method than ours. If we lived as near the equator as they do we might see more wisdom in their apparent madness. The women like ample skirts and waists with sleeves, but they save their shoes and stockings for special events.

The Guamese impress the traveler as an amiable people. They are intelligent and eager to learn. Their enterprise in this respect must be regarded as astonishing; for the Spanish authorities frowned on education because they thought the natives, if left ignorant, would be more tractable and less likely to rebel against the government. Since the American occupation of the island at the close of the war with Spain, schools have been established.

A marked filial devotion may be noted between the parents and children. When marriage comes, the interested fathers and mothers plan and work together to give the young couple the right sort of a start in life. When the parents reach old age, the sons and daughters repay by taking care of them.

"It is not unusual," says one man who has studied this aspect of Guamese character, "for a man or woman of 40 or 50 years to ask permission of the parents before engaging in a business transaction. The spectacle of old women, abandoned and forgotten by their children, acting as water carriers as in Samoa and among our Indian tribes, is unknown in Guam."

Many of the houses have roofs of colored tile and are constructed of wood, stone or stucco. The Americans introduced corrugated iron as a good roofing material, which some of the natives have taken as an example worth following. The older residents or those of a conservative mind stick to the customs of their forefathers as good enough for themselves; they prefer dwellings thatched all over with palm tree leaves.

Agana, the seat of government, is an industrious little city that sets the pace for the few others in Guam. The houses are more modern and the streets more spacious and better surfaced than those of its sister towns.

In the public square you will see the principal church of Agana and of Guam. Founded in 1669, the earthquake of 1902 shattered it; as yet it has not been restored to its former glory, but the natives give it the same degree of adoration.

"Its great bell," a former governor of the island once said, "tolls every morning at 4 o'clock calling the people to matins and to their daily tasks. The church is a sacred possession hallowed by the worship of generations. The people could not be parted from it nor from the daily observances connected with it."

The island imitates Italy in shape, though if that country can properly be compared to a boot, Guam must be reckoned as a pair of hose such as men wear. The toe of Italy points downward, and that of Guam takes a similar position. There is a dissimilarity, however, because the Italian boot projects northwest, while the Guamese upper prefers the northeast direction.

San Luis d'Aprâ, 10 miles from Agana, has a better harbor than those of Pago and Tarofofo, which are on the other, or eastern, side of the island. Agana's own harbor gives no assurance of safety in a storm, inasmuch as an anchor will drag readily in the coral bottom. Apra has a clay bottom. Consequently, we have the queer situation of the capital using the Apra harbor regardless of the disadvantage the location entails.

Would you pick cotton from trees? Then go to Guam where three varieties grow wild. The tree cotton flourishes at a height of 60 feet.

Guam has other remarkable trees besides those that yield cotton. The women take the long leaves of the pandanu and braid them into mats and hats. From the hau tree, the men manufacture a strong rope impervious to water. The cocoanuts here are the best in all the tropics, the pineapples are juicy and the breadfruit delicious. The jungles contain many hardwoods valuable for shipbuilding or cabinet work.

The island, of course, is administered by our Navy Department, because of its great importance as a naval station.

Above—A street in Agana, the capital of Guam, which reveals some modern homes with tile roofs and stuccoed walls. Center—The inhabitants of this village in Guam do the family washing in the stream that bisects the town. Below—This home of a day laborer in Guam rests on short posts, and the entire exterior is thatched with palm leaves.

Shut the Side Doors, Too

IT WAS good campaign strategy to keep up the cry against the three per cent immigration law. Opposition would give the public the impression that the law is doing what it was meant to do. Our Jewish friends especially made Congress ring with their protests, but the House decided by a heavy vote to keep the three per cent restriction in force for another year, and the opponents of the law know in their hearts that they are once more the beneficiaries of American stupidity.

Whether for or against restricted immigration, citizens should understand that the three per cent law is not doing what it is advertised to do. If there were an immigration law restricting immigration at the port of New York, but leaving Boston and Philadelphia and the Gulf ports wide open, no one would pretend that we had immigration restriction.

Yet that is practically the situation now. All our front doors are restricted, that is, our seaports east and west. But our side doors, Canada and Mexico, are wide open.

And this is what has occurred: the very emigrants described by our State Department as most undesirable are entering the United States by way of Canada and Mexico. Our law has had the effect of glutting those two countries with the very elements which this government is trying to keep out. After a certain residence in Canada, they come here as "Canadians," and after a certain residence in Mexico, they arrive here as "Mexicans": that is, those who wait to establish formal residence. Great numbers of them come across the border in the dark, without formality.

The difficulty is that this government cannot refuse "Canadians." And the abuse of racial names by foreigners of no country at all, has gone so far as to raise again the question of proper classification.

Canada is now confronting the concrete problem which this government has unwittingly forced upon her by its ill-considered action. Canada is glutted with undesirables. Stopped at our seaports, but not at the frontier, they swarm along our land boundaries waiting to get across. Canada has tackled the question, has frankly named names, and is now in the throes of inexperienced combat with the world organization whose underhanded work upsets governments and ruins patriotic officials.

The United States could have prevented all this by a foresight which should have taken these obvious possibilities in hand at the first.

The facts are sufficient, however, to show that the fervent protests against the three per cent restriction law are merely theatrical, to make the American people believe that the doors are really guarded. The excitable protesters know that the United States might shut the sea doors completely, and it would make no difference as long as the land doors, north and south, were left open.

A Nation of Co-operators

TO FIND one nation in the world that is genuinely prosperous, where the people are all busy and happy, while discontent and poverty are practically unknown, should mean much to us at any time. Such a nation can perhaps teach us things worth knowing.

Recent travelers and students are practically unanimous in declaring that Denmark is just now the most prosperous country in Europe, and the most democratic, judged from the point of view of a general distribution of wealth and the enjoyment of equality of opportunity. With a high average of comfort, we are told, there has been brought about in the little Scandinavian kingdom a high average of intelligence and of culture. Indeed, Denmark puts forth well-based claims to be the best educated nation in the world. And this because it is a nation of farmers.

The secret of it all? The question is answered in a word: *Co-operation.* Dr. Frederic C. Howe calls his recent, very interesting and informing volume, "Denmark: A Co-operative Commonwealth." He shows very clearly that the remarkable progress of the country is due first and foremost to the development of the co-operative spirit and of practical co-operative methods in agriculture. Denmark is distinctively an agricultural country. Industrially, it hardly counts; but it exports some $150,000,000 worth of agricultural products yearly.

As Dr. Howe points out, the remarkable progress of the Danes economically, and at the same time mentally and morally, may be traced to successive steps forced on them in the seventies. Losses of territory and the competition of American and Argentine wheat had reduced the country to a very low ebb. These recuperative steps began with the breaking up of large holdings into small farms and the practical extinction of tenant-farming in favor of peasant proprietorship. Collective buying and collective marketing rid the Danish farmer of the exactions of the middleman. With intensive farming went a standardizing of products. They sent a commission to Ireland to find out how it was that the Irish eggs, butter and bacon were able to command such high prices in the English market. Then they so far improved upon the Irish products that they were able to compete with them advantageously.

The farmer buys food for his cattle, agricultural machinery and all kinds of farm and household supplies through wholesale co-operative stores in Copenhagen.

The Danish farmer is also a banker. There are 521 co-operative savings banks and the farmers' financial problems are happily solved by means of efficient co-operative credit unions. Co-operation has furnished the coherent element in Danish democracy and given a new and immensely significant trend to popular education. The Danish farmers are a power in politics because they do things for themselves and are not dependent on the government. They have made Denmark a genuinely democratic country, because in economic organization and administration they prefer private to state initiative and activity. They even run their own schools without regard to the politicians.

A Bonus for the Bankers' Benefit

BONUS legislation, or attempts at it, is putting the political interest in Congress at a disadvantage. Bonus talk long ago lost its last pretense to patriotism, and has become crass politics, with the next election in view. What the soldier must feel, can only be surmised. He would probably be willing to wipe out the whole account—and it is not he who insists that an account exists!—if assured of a steady job in a prosperous country.

The proposals put up to Congress grow steadily worse. They were bad enough to begin with, in that they gave the bankers more than they gave the soldiers. Bonus interest usually runs one and a half times more than bonus payments. The soldier would always receive more if given the interest instead of the principal.

But the worst proposal of all is the latest, the issue of 20-year certificates on which the Federal Reserve banks would be authorized to lend up to 50 per cent of their face value, the soldier *paying interest* fixed by the amount of the regional discount rate charged by the Federal Reserve Bank, *plus two per cent.*

That is, by making himself a borrower, binding himself to pay a plus interest, and putting up a certificate worth more than twice as much as he is able to borrow on it, the soldier may be handed a few dollars. Otherwise the bonus is postponed to the safe period of 20 years.

But that is not all. The ex-soldier is not paid this borrowed amount on government account, he is only loaned it by the Federal Reserve. He still owes for the money that he is given—owes principal and interest to the Federal Reserve. If the ex-service man defaults in his payments, the bank can go to the government and get the money. The government does not come to the rescue of the soldier, it comes to the rescue of the bank, and redeems the certificate for the bank, which it would not do for the soldier. It is openly figured that "through borrowings and forfeitures" the soldiers would lose one billion dollars!

In this way—putting off the soldiers for 20 years, and profiting by their emergencies in the interim, burdening the taxpayers to the tune of about four billion dollars, fattening the now ravenous interest system and the private bankers' organization known as the Federal Reserve—in this way politicians play timorously and dishonestly with a big question. The proposal is neither generous nor just, but it illustrates once more the collapse of the old methods.

Mr. Hays Speaks

"I AM NOT going to reform the movies. There is to be no clean-up campaign in the sense many have described," said Will H. Hays, ex-postmaster-general in a copyright interview. The program, as Mr. Hays outlined it, is one of business extension. The rapid rise of what Mr. Hays describes as "the theatrical end of the business" has delayed the exploitation of the church and school as profitable movie fields, and to remedy this is the avowed aim of Mr. Hays.

This may be Mr. Hays' method of avoiding a confession that the movie business was on the brink of moral collapse, it may be his indirect way of saying that movie conditions ought to be changed. Certainly his great verbal attention to Bible pictures was intended as a sop to that very section of American public opinion which had shoved the movies so near the edge of destruction. As far as anyone is now aware, the "movie public" has never craved "Bible pictures," except those vile imitations whose Biblical titles masked quite un-Biblical scenes of lascivious license. The country does not clearly see Mr. Hays' employers preparing pictures for Sunday school conventions just yet. Publicists, however, do quite clearly see Mr. Hays' adroit appeal to the kind of public opinion he is afraid of—for his employers.

The scare thrown into the movies by the rising sense of outrage in the country, did not come by reason of the alien masters of the movie cowering beneath the protests of American decency. They are not capable of such a reaction. The triumph of public opinion was made in quite other quarters. Wall Street was heavily involved in movie investments. American financiers were quite alive to the fact that moral repudiation of the movies would mean their financial ruin. That is where the work of rescue began. But it hasn't touched the pictures yet. Public opinion has been treated, not the pictures. The selection of Mr. Hays was a soothing dose for public opinion. Now, if Mr. Hays, contrary to his announcement, will doctor the pictures into decency, something will have been accomplished. Thus far nothing whatever has been accomplished as far as the actual pictures on the screen are concerned. And it is about the pictures that public opinion is exercised.

It Depends on Us!

EXTREMELY suggestive, and not without particular significance in this country, is the text of a recent "parliamentary reply" by Sir Robert Horne, Chancellor of the British Exchequer, to a question asked by Neil McLean, Independent Liberal leader:

> "It is the intention of the government to permit the establishment of an unrestricted market for gold in London at the earliest date at which the state of the exchanges renders this course possible and desirable. The question whether, and to what extent, the public will then return to the use of gold coins in place of notes for ordinary purposes of currency is one which must ultimately depend mainly on the action of the community itself."

The Chancellor of the Exchequer corresponds to our Secretary of the Treasury, save that he has the further responsibility of preparing and submitting the annual budget and defending it on the floor of the House of Commons. For seven years, the British people have been accustomed to paper money, and to paper issued directly by the British Government without the intervention of banks. Previously, they had been limited to the use of gold and silver coin and Bank of England notes exchangeable for gold on demand. It was generally supposed that any other medium of exchange would so utterly fail to command the confidence of the people that its circulation would be impossible. Now the nation's chief financial officer admits that it is all a matter of the people's choice. Whether the public will return to the use of gold coins instead of notes will depend mainly "on the action of the community itself." That is, he foresees the probability that having experienced the superior convenience and elasticity of the paper currency which made it possible to finance the war, the people of Britain will not be particularly anxious to go back to the use of a medieval metallic currency.

The difference between a gold currency and a "gold-based" currency is essentially only a difference in degree. It is as true concerning a continuance in this country of a currency with a fictitious, costly and cumbersome "gold basis" controlled by the banks, as it is concerning the "return" to gold coin in England, that it depends on the action of the community: on what "you and I and all of us" propose to do about it.

And by the way, some interesting questions might be asked as to the reasons and the results of a government-restricted market for gold, not only during the four years and three months of war, but also through the three years and four months that have elapsed since the signing of the armistice. But that is another story.

Mr. Ford's Page

FINANCIAL conferences usually come to very little, because the conferees are financiers. Even doctors will not treat themselves when ill, but financiers insist that no one but themselves understands their ailment. Their thought more likely is that anyone but themselves would probably find a cure. For the ailment of which financiers complain is not their own, but that of the society in which they function. It is the cow that has grown ill, not the milker. But the cow's illness is the milker's loss, therefore the conferences.

Bankers are useful people, there is no doubt about that. That is to say, banking is capable of being a very useful business. But, on the one hand, there are so many bankers who are not engaged in straight banking at all, and, on the other hand, there are so many bankers who are only engaged in the shop routine of banking, that the whole occupation has lost a great deal of the dignity it once commanded in the public mind.

If the bankers who do straight banking would regard themselves as naturally the first men to probe and understand our monetary system, the custodians of that part of our common business, instead of being content with the mastery of local banking house methods; and if they would deprive the gamblers in bank balances of the name of Banker and oust them once for all from the place of influence which that name gives them—clean them out for the good of the business of banking!—then two benefits would follow: banking would be restored and established as the public service it ought to be, and the iniquities of the present monetary systems and financial devices would be lifted from the shoulders of the people, and prosperity released.

There is an "if" there, of course. But it is not insurmountable. Affairs are coming to a jam as it is, and if those who possess technical facility do not engage to remedy the case, those who lack that facility may attempt it. Nothing is more foolish than for any class to assume that progress is an attack upon it. Progress is only a call made upon it to lend its experience for the general advancement. It is only those who are unwise that will attempt to obstruct progress and thereby become its victims.

All of us are here together, all of us must go forward together; it is perfectly silly for any man or class to take umbrage at the stirring of progress, as if it were a personal slight directed against his dignity or its pre-eminence. If financiers feel that progress is only the restlessness of weak-minded persons, if they regard all suggestions of betterment as a personal slap, then they are taking the part which proves more than anything else could do their unfitness to continue in their leadership. In that temper the glory is already departing.

Of course, where selfishness enters there are antagonistic interests. If the present faulty system is more profitable to a financier than a more perfect system would be, and if that financier values his few remaining years of personal profit more highly than he would value the honor of making a contribution to the life of all the world by helping to erect a better system, then there is no way of preventing a clash of interests. No way whatever, until that financier wakes up to the invincible truth that his tenure of power depends upon his alliance with progress, not against it.

It is perfectly safe to say to the selfish financial interests that if their fight is waged to perpetuate a system just because it profits them, then their fight is already lost. That is a fact. Their fight is lost before it begins, and all that they can lose more is the credit they still retain.

POWER is not power when it is touched with Fear. For that reason there is no "money power"—high finance is afraid, afraid of change. But "high finance" is only a term used to intimidate people. Comparatively few bankers live in New York, and when the thousands of bankers outside of New York refuse to send the people's money to the eastern speculators, the so-called "money power" will cease to exist even as a name. Bankers of this country can easily extricate themselves from the New York net whenever they like. And there are enough thoughtful, honest, serviceable bankers in the country to do that, and thus take the first step toward monetary reform on the basis of community service and justice.

It is hardly thinkable that any man of common sense, any man who has a vantage point from which he can look over the world, any man who really knows what the plight of the planet is today, could be so blind, so crass, so utterly soulless as to fight now—now of all times!—merely to save a financial system that is founded on a lie and which has collapsed upon itself. It is unthinkable that bankers who believe their profession to be a really useful social service should refuse to look into the future for clues as to how to make their business an assistance to the new conditions that are coming.

When one looks over the world today, taking in the condition of the nations, and then probes beneath the surface for the cause of these conditions, one catches in a glance an understanding of where the pain of progress is caused.

It is not the pain of change—we were made for change; our minds are changing continuously, so that our mental life is an endless series of swift twinklings. It is the pain of resistance. Men resist for many reasons, but all the reasons becomes one in the end, and that reason is Fear. Fear makes men selfish. Fear makes them cruel. Fear sews them up in a sack, so that they cannot move forward.

People talk of the "Money Power." It is a misnomer. Power that is power, knows itself to be power; power is conscious of itself, confident of itself. But the "money power" is not self-confident. It foresees change, and instead of proving its right to leadership by greeting the pressure of destiny toward a better way of doing a thing—a way with less cruelty, less injustice, less uncertainty in it—it is actually feeling the tremor of Fear!

Now, if that be a fact, we shall have to stop talking of the "money power." It still has force enough to harm and destroy, but in using that force it merely hastens that which it fears.

Why should finance fear for anything? The world will still be here, the best piece of raw material we know of. Men will do business with each other. There will be money, and there will be need of masters of the mechanism of money. Nothing is going to depart but the hooks and crooks which snarl life in knots and tangles every little while. There will be some readjustments, of course. Banks will no longer be the masters of industry, but the servants of industry, as they ought to be. Business will control money, instead of money controlling business. The ruinous interest system will be greatly modified. Banking will not be a risk, but a service. Banks will begin to do much more for the people than they do now, and instead of being the most expensive businesses to manage in the world, and the most highly profitable in the matter of dividends, they shall become less costly, and the profits of their operation shall go to the community which they serve.

But that is nothing to fear, is it? No financier would fear to have his son and daughter enter into a society where financial rapacity were impossible. The widows and the workingmen certainly would not fear it. Why should high finance? Why, indeed, should not high finance take the active hand in endeavoring to create such a system? For there is one thing that even the most secluded financial expert must know, namely, that a world that is good to the widow and the workingman is good to everyone else.

Pain grows out of resistance. The tragedies of progress are with those who tried to arrest it to save their unjust privileges. Desire for the equities of the new era casts out all fear.

Easter "Messiah" for Folks of the Prairie

Where Singing Has Become a Farming Community Fashion

Above—The "Messiah" chorus of hundreds is trained for weeks preceding the Easter week renditions. Center—Farmers fill the highways leading to the auditorium. Below—Bethany Auditorium showing the crowd entering for one of the concerts.

By CHARLES MOREAU HARGER

EASTER morning on the prairies of Central Kansas is much like Easter elsewhere in the great Middle West—the same wide vistas of rolling lands, greening fields, trees abud, here and there a lazy stream. Nor when one drives along the upper Smoky Hill valley, where comfortable farm homes, touched a little by an Old-World quaintness, spread their richness, is it different.

Yet in the vicinity of the Swedish town of Lindsborg, something unusual will take place Easter Sunday. Moving toward the village will be hundreds of motor cars, some bearing city folks from a hundred miles away, but mostly filled with ruddy-faced men, flaxen-haired women and children, all bound for the crowning event of the year—the Easter "Messiah."

For years Lindsborg has been developing its attraction; it has been born into the present generation; through childhood, youth and middle life for thousands it has been a motif leading toward the day of gladness. To the public it means a single concert; to the community it is an expression of its life. The rendition of the famous oratorio once a year is an incident; the preparation that has led up to it is an education.

Lindsborg is the center of a settlement of Swedish farmers. It has one of the leading colleges of the state, Bethany, where approximately 1,000 students are enrolled and whose musical department is one of the best known in the West. To Lindsborg belong the "Messiah" festivals—they are a part of its history.

On the campus of the college is a statue of Carl Swensson, the founder of the college and one of Kansas' great men, prominent alike in education, finance and politics until his death. An associate, while touring England in 1879, heard the "Messiah" given in Crystal Palace. He brought home the idea of such an event in America and Dr. Swensson developed it in Lindsborg, then a struggling settlement. In December, 1881, with a choir of 100 voices, the first rendition was given of Handel's masterpiece among people of Swedish extraction in this country. At Easter, 1882, the first public appearance attracted the people of the surrounding towns and each Easter since has seen a steadily growing interest reaching over the entire Southwest.

As Oberammergau lives for the Passion Play, so do the families of Lindsborg and around it live for the "Messiah." It supplies the year around a vital interest in their lives. It is a community idea—not the presence of a great artist alone. Each has a part. Five hundred voices take part in the chorus, 40 pieces are in the orchestra—all are from the little town of 2,000 inhabitants and the farms adjoining. When it is considered that Mme. Schumann-Heink, when she appeared as a soloist in the concert, received a fee representing a tax of 75 cents on every man, woman and child in the town, it makes the city efforts at maintaining a season of grand opera seem small and futile.

The Lindsborg chorus is an artistic body that would inspire the respect of any community. It has splendid routine. Many of the singers dispense with the score and rely on memory. Why should they not, since many of them have been singing the "Messiah" for a quarter of a century, and some who took part in the first performance 40 years ago still retain their places in the chorus. It is rather a family affair, this choir of Swedish-American farmer folk, and it is no uncommon thing for three generations to be represented. From the bass section more than one grandfather has heard the voices of his daughter and granddaughters among the sopranos and altos.

It is not surprising, therefore, that this chorus attains a tone of surprising unity, and that in all matters of rhythmical and intervallic precision it is unsurpassed. The quality of the tone is beautiful. In all massive effects it is of overwhelming sonority. The sopranos are remarkable for the purity, the flexibility, and the smoothness of the tone produced and the confident ease with which they approach trying altitudes of pitch. The contraltos share the delicious sympathy of tone quality common to most American choruses. The tenors achieve brightness and aggressiveness, and the basses are splendidly sonorous.

This co-operation of 25 per cent of the town's population has its vivifying effect on the social and religious life. The service comes from the heart. The organization is a purely voluntary one. It has no constitution or by-laws. Each year secretaries and other officers are elected. These officers formulate the rules for the year. No member receives any compensation. On the other hand, virtually all buy season tickets for the festival. The proceeds, if any, at the end of the festival go directly into the college treasury.

Practice begins the first week in January and continues with twice-a-week rehearsals until Easter week. When the eventful day comes, the chorus is reinforced by famous artists brought there to carry some of the great solo parts and give recitals, which are a part of the week's program. Among the artists and organizations that have traveled to the little Kansas village are: New York Philharmonic Orchestra, Elman, Nordica, Ysaye, Schumann-Heink, Hempel, Fremstad, Claussen, Gadski, Nielsen, Galli-Curci, Sembrich, Gates, New York Symphony Orchestra, Middleson, Pablo Casals, Anna Case. This year's headliners are Margaret Matzenauer, noted contralto, and Ricardo Stracciari, baritone. These soloists from New York will assist in the renditions: Marguerite Ringo, Mildred Bryars, Charles Stratton, Frank Cuthbert. There also will be a Mid-West musical contest for girls' glee clubs and individual excellence in piano, organ, voice and expression, for which there will be liberal cash prizes.

But let us get back to an Easter morning. On the edge of the college campus is an octagonal auditorium, severely plain both outside and in, seating about 3,000. Long lines of motor cars are parked along the street and in the elm-shaded park. These cars have come from Topeka, Wichita, Hutchinson, and scores of little towns. Special trains are bringing other crowds. Every seat has been sold and hundreds of persons, unable to gain admission, enjoy a sort of softened inspiration from the music that comes through the board walls when the great chorus sings.

Dusk falls before the crowds have ceased coming and the audience is hushed for the appearance of the chorus. Away up in the corner sit half a dozen little girls whose piping voices now for the first time sing in public. Beginning with them the chorus contains those who have sung two, three, four years and upward. In the audience a respectful hush attends the tuning of the orchestra. Gray-bearded fathers of the colony, who were the first to settle in the community, sit beside the third generation. The countenances of all are calm and contented—when the great chorus fills the hall with harmony, an eager, religious light comes into their eyes, and not a muscle moves as their ears receive the thrilling sound.

The "Messiah" has been sung by many persons the world over, but it is doubtful if the choruses were ever better sung than when these trained voices, rehearsed for a year, burst forth in divine harmony. They sing it with the scriptural words in their hearts—it is a praise anthem to the God who had prospered them and kept them together. "Comfort ye," is the message. "Comfort ye, my people, saith your God. Speak ye comfortably to Jerusalem and cry unto her that her welfare is accomplished. The voice of him that crieth in the wilderness, Prepare ye the way of the Lord . . . . Every valley shall be exalted, and every mountain and hill made low, the crooked straight and the rough places plain." Thus sang the tenor.

Then the promise came in the rushing tide of voices from the chorus: "And the glory of the Lord shall be revealed, and all flesh shall see it together, for the mouth of the Lord hath spoken it."

The wonderful "Hallelujah" has spread its benediction and the great audience goes out into the night softened and enthralled.

The "Messiah" is in a sense an institution of Kansas. Jens Stensaas, treasurer and manager of the college and of the "Messiah" for 20 years, believes that yet greater things are to come. "The chorus has made Lindsborg the most musical community in the country," he said.

Why Has Gold Dropped Out of Circulation?

Bad Legislation Made Unproductive Gold the Master of Productive Industry

By A. R. PINCI

THE official per capita circulation in this country during 1921 was estimated at $53.44, a sum exceeding by one-third the per capita stock of gold and silver in the Treasury of the United States. Authorities, however, seem to agree that the actual circulation at any one time amounts to much less; less by about one-third. In other words, there is a practically stationary fund of money, but not in circulation; it is added to about as fast as it is diminished.

This fund represents the aggregate of scattered individual capital, and, of course, is not susceptible of precise totalization. It consists of our pocket money, money in cash drawers, money in savings receptacles, ambulant capital, concealment, money abroad, and the like, which is not a true part of the volume of circulation. The actual circulation during the last year, therefore, approximated the per capita stock of gold and silver—about $35.02.

Economists declare that in this country in average times money turns over every 20 days, which in the course of a year means 18 turnovers. On a per capita basis this turnover last year must have been about $630.

This total, however, shows a discrepancy in relation to the actual business done during that period. The bank clearings in the United States, according to figures furnished by the editor of the *Commercial and Financial Chronicle,* were $359,391,941,908, roughly, about six times the total turnovers for the country. This means that the difference must be accounted for otherwise. It can be accounted for by credit operations. As the total clearings are not a complete record of all credit transactions, but only a part, it will be found, by further delving into this subject, that the ratio decided upon by the experts of the National Monetary Commission of the United States that business in this country is done upon a basis of nine-tenths credit and one-tenth cash, with the odds in favor of a greater future credit ratio, is approximately exact.

Man, Not Gold, Fixes Values

THE wealth of the United States, therefore, from a standpoint of money, does not lie in the mass of inert gold and silver metal reposing in the government vaults. The true basis of it is the tangible wealth—wealth that bespeaks utility as well as value—represented by countless commodities that mankind today regards as essential to its well-being. The value of the gold and silver belonging to the nation is, technically, just about what the actual per capita circulation was during the past year, but its pro rata distribution would avail nothing to the new owners if they were unable to exchange at once for some vital commodity.

The underlying principle of the gold standard, so dear to the majority of the professional bankers, is that it establishes value. This is absurd. It is an inherited superstition, and has its followers because it seems to operate. But does it? It is man that has arbitrarily fixed the value of gold and silver and everything else that comes under the category of natural wealth. It were just as logical to fix the value of air or sunlight.

Gold today has a value because a preponderantly great number of men, not themselves the principal owners of that gold, by a sort of miracle, agree to that value. But in reality it is worth nothing unless the owner of any part of it is sure that he can exchange it for whatever he wants whenever he can get it. The same may be said of silver. If these two metals, now finding a probable competitor in platinum, are by common consent used preferably to something else it is because nature has endowed them with certain attributes of comfort in handling that meet the exigencies of traders.

Platinum money has been the object of the attention of Russian leaders during the last two years or so. Platinum, however, is a comparatively new metal, commercially, and today is worth many times its weight in gold. Yet it was a few decades ago that one of the sub-Treasuries of the United States received "spurious" gold coins—I believe $20 pieces—which had passed through many banks, but that were made of gilded platinum. Were one of those coins to turn up today none but a metallurgist would know its true commercial value. It is doubtful if it could be sold for face value, since gold-plated platinum is an anomaly. And it is likewise doubted if a double-eagle stamped on platinum would be accepted.

U. S. Bursting With Gold But Begging for Capital

THE humorists of the world lampooned Germany's proposed porcelain money. Of course, the idea was not original with her, because porcelain coins have been used in the Orient for two centuries, according to authorities. What is the difference between porcelain and any other material if enough people agree to accept it reciprocally as a unit of value?

Porcelain can be made to have greater value than solid gold. At the time of writing an American corporation announced the exhibition of American-made service plates valued at $10,000 a dozen. There are more people in this country who would exchange $10,000 in gold for those porcelain plates—but there are not enough such plates to meet the demand. In other words, there are persons who think more of 12 porcelain discs than they do of 500 gold coins!

The assumption that gold and silver are in some mysterious and sacred way the only genuine capital is arrant nonsense. Neither is the lifeblood of the world. Either is in itself capital in no higher sense than wheat or cotton, and perhaps less so. Just now the United States is bursting with money, but shy on floating capital.

The Treasury Department reports that at the end of 1920 there were 66 governments using the gold standard; four the silver standard, and four newly created governments had not yet established theirs. Yet in ordinary use both metals circulated freely and were practically interchangeable. While bullion value fluctuates, there can be no arbitrary distinction drawn between the two metals as media of exchange. From time immemorial gold and silver have been used as money, and it is reasonable to suspect that a government errs when it erects one into an arbitrary standard to the exclusion of the other, on no better grounds, very likely, than a sentimental preference.

It has been claimed that by establishing a sort of alternating circulation greater stability would follow. France, ostensibly a gold-standard nation, has never ostracized silver, and it has been estimated that her hoard of silver has almost equaled her gold reserve, which for a period exceeded all the gold in possession of the banks of issue of England. France's example of successful bimetallism is unique; and, of course, it must not be overlooked that she does business for cash; credit instruments for domestic use are still in their infancy. The people, therefore, have been obliged to carry as much of a cash reserve as possible. Yet when time came to prevent serious financial disturbances, silver was just as good as gold, and consequently France has had fewer financial disturbances than any other country.

The gold standard has been developed through the influence of commercial forces. It is not an invention of man. At the time it first became universal it represented the best medium available to man for the function to which it was then subjected, namely, constant circulation and turnover, but it is entirely probable that just as electricity is displacing steam, gold may be supplanted by some more practical medium. Whether this medium has yet been found or is still undreamed of, is for mankind to decide.

Evil Stalks Behind Our Gold Hoara

THE gold heaped in the vaults of the United States has given professional bankers so much confidence that they utterly disregarded the evil in its wake. Because all the gold that foreign debtors could export to the United States has been sent over, the gold standard has been practically suspended in Europe. Business between this country and Europe on a gold basis is impossible, and if Europe ever succeeds in demonetizing gold, then American financiers will have to hump. Their hoard of gold will be almost useless.

The foreign exchange problem of today is all the proof needed that gold and silver have, independently of each other, an excellent value as artificial media. Neither, however, is a unit of value. It is this fallacy that these two metals, especially gold, have a unit of value that is responsible for the chaotic and disastrous industrial situation of today. Because every commodity must be reduced to a gold unit of value before it can attain the privilege of exchangeability with some other American commodity, business is at a standstill almost everywhere, labor is idle, and the productiveness of more genuine capital has been suspended.

This, naturally, is a paradisiacal situation for the banking element, but the question must be put:

"What does the government get out of it?"

Less than nothing. The government suffers in ratio to the impediment of a normal and healthy industrial era. Bankers and owners of gold thrive, after a fashion, because it is next to impossible to convince the people of the fallacy of the gold standard miracle—even when they suffer through the very operation of the gold standard.

When $20 in Gold Was Worth $9

IT WOULD be interesting to know, if it could be figured out, just what it is costing humanity in general by the turnover of this fictitious standard at a time when nature itself has shown its fallibility. A gold dollar in the hands of a professional banker will cost dearly to the user of that dollar, presuming he is permitted to borrow it. A man owning an ordinary city lot cannot borrow from a national bank upon that lot, but if he is otherwise acceptable to the banker—which means anything—he can borrow on his own note, irrespective of the uses to which the loan will be put. A man owning another lot, who wishes to produce something by working the earth, now—he could not a few years ago except from a usurer—can get a loan, but not from the average banker; he must go to a special bank, provided by the government for the purpose. The very man who wishes to reduce the gold standard to an understandable unit of commodity value by sound means and reproduce it is the very man the gold owner ostracizes.

About two years ago a report for the American Mining Congress stated that the value of gold, under conditions of minimum cost for its production, was fixed by Congress many years ago at $20.67 an ounce, but the purchasing power of an ounce at the time the report was issued was only $9, and the cost of production "has so far increased that it is no longer possible to produce the metal at a profit."

As the purchasing power has increased somewhat, but not considerably, since the report was issued, it might be inferred from it that professional gold mining, at least in the United States, would be slowed up. This, naturally, is the hope of most bankers, who wish to see only a small amount of gold produced to take care of the arts. Financially, those bankers believe that the gold supply is now about right. That is to say, right as far as they themselves are concerned.

Available records bear out the statement that every gold boom, whether that in California or Australia, or the comparatively more recent Alaskan discoveries, paralyzes the average banker. He fears "cheap" gold. This fear alone goes to prove that the value of gold is artificial, imaginary and subject to change. It does change. The only thing that restricts the oscillations of value is that the governments adopting the gold standard have a fixed purchase price for gold. If governments canceled this arbitrary price the commercial and financial value of gold would drop. After all, what is there to insure the retention of gold as a medium of exchange in perpetuity?

If gold were officially a unit of value, then one might wonder why the several governments have not made gold and its production a government monopoly. Had this been so, then there might be some logical reason for adopting the gold basis—with the understanding that government gold would be fiat money as anything else. It is utterly out of the question for a progressive nation to have as much gold as may be required to do business—dollar or sovereign or other unit—thus necessitating paper or other money to make up the required difference for circulation purposes.

Danger in Divorcing Finance From Commerce

AS LONG as any man is at liberty to prospect for gold, he is apt, after a fortuitous auriferous find, to become "rich" without having added anything to the real wealth of the nation. If his claim is title clear, he can proceed to unload as much gold as the earth will yield at that point upon a market and a world already overburdened with gold. He can take at once an important part in any center where he elects to live, consume the production of others, start a bank of his own and handle other peoples' gold and credits and make a profit—all without the least industrially or agriculturally productive effort on his part.

There have been half a dozen such men who have graced the East during the last 20 years. One or two, I believe, are still living. As far as these gentlemen were concerned—and, of course, all other fortunate adventurers of the kind—the metals they found, in the way of gold and silver, were so much inert, dead-weight mass, yet fellow men elsewhere were perfectly willing to accept it in exchange for much more valuable matter. A pound of bread is vitally worth much more than a pound of gold.

Gold begets its value because it is both an order and a receipt for value. But this value is artificial and arbitrary. It is a common index of everything of value, but unfortunately men think the other way—that everything is indexed according to its gold value. Individuals deal wholly in commodities and services, and employed money at first, and now credit generally, simply as the vehicle or medium by means of which values are exchanged.

Finance is a much abused term. Definitions of it are many. Finance, however, cannot and should not be dissociated from commerce, from which it has sprung. Bankers have made of finance a world apart, in that they deal in money and credit as values in themselves; values separate and distinct from their function of medium of exchange. In other words, finance has given money and that which passes for money the fictitious value which is bought and sold daily the world over, usually at the expense of commerce.

"Coin Has a Flag But Gold Has Not"

THE banker is a creature of commerce, and, therefore, ostensibly subjected to it, but by a series of evolvements the bankers have taken to the saddle, and ride commerce as it pleases them. The government, all governments, in fact, have more or less ignorantly aided and abetted these developments, so that today every government is at the mercy of bankers—not only its own, but all the others.

Coin has a flag, but gold has not. Consequently gold follows the line of least resistance. When a degree of resistance is found that bankers do not like, or are unable to govern, then gold avoids the issue. The government without gold is, under the circumstances, at the mercy of the gold standard and its perpetrators; the government with gold enjoys but one privilege—of being in partnership with the gold operators.

This point is worth some analysis. The United States today has more than three billions of dollars of gold, at its present value. A man with a million dollars, or any sum above or below it, as long as it is an extraordinary sum, will have very much trouble in obtaining gold for the amount. Unless he has gold-bonds, and they are presented at maturity, the chances are that gold cannot be obtained—not as a matter of commonplace exchange. It can, of course, be obtained by directing one's attention to this one step. Gold paid in the redemption of bonds is expensive gold—gold for which the government has paid an extravagant amount to a selected few.

The underlying explanation as to why the people are satisfied to be on a gold basis despite the difficulty of obtaining gold on demand is due to the impression,

(Concluded on page 13)

Wall Street Dupes the Country With "Katy"

A Narrative of the Looting of a Railroad and of a People

By CHARLES ALBERT COLLMAN

THE banker who was showing me through a trust company in the financial district, stopped suddenly and observed: "I feel sorry for those boys."

We stood before an inclosure partitioned off by a brass grill. Through the apertures of the grill, we could see nearly a score of young men seated at their desks. Beside each of them, a stock indicator was clicking noisily. The young men were scanning the figures on the ticker tape as it ran through their fingers.

These were the loan clerks of the institution. The trust company every day loaned large sums of money on call to Wall Street brokers. When a customer buys stocks on margin, the broker borrows 80 per cent of the purchase price of the stock from a Wall Street bank.

It was the duty of these clerks to examine the ticker tape constantly, to see that the prices quoted for the stocks did not fall below the safety point. When that occurs, the bank sells the stock collateral on the market to protect its loan.

"I feel sorry for those boys," repeated the banker. There was a note of sincerity in his tone. "But we must have somebody to do this work. The tape hypnotizes them. They see the road to easy money. Many of them go wrong."

A few days later—it was February 14—I was reminded of the banker's words by an incident that is old as Wall Street's history. A young clerk stood before a judge in the Court of General Sessions. He was charged with having stolen $120,000 in securities from his employers, the National City Company.

His plea of guilty was scarcely audible in the court room. "I gave the stocks to a broker," he said. "I am here to take my medicine. I speculated in Wall Street and lost."

Remanded for sentence, he was led across the Bridge of Sighs into the Tombs.

Wall Street gets them very young.

Fiends of the Ticker Tape

THE financial district fulfills a genuinely useful purpose as the country's open market for investment securities. But it is the gambling losses of the margin trader that build the skyscrapers, support the Stock Exchange and maintain the commission houses. The man who trades on margin thinks Wall Street will show him the short cut to wealth without labor. But he is chasing the pot of gold at the end of the rainbow. One of the oldest and most conservative brokers in the Street once confided to me that, at the close of the year, his books rarely showed a single customer who had averaged a profit from his stock operations.

The stock indicator, the little machine that records the prices of the securities that are being dealt in on the Stock Exchange, is a Yankee invention, and its by-product, the "ticker fiend," is to be found in no other country than our own.

The ticker fiend is the logical development of the confirmed margin trader. From 10 a. m. to 3 p. m. he sits on a high stool in his broker's office, his eyes glued to the ticker tape. He is a blank in life's lottery, a useless human entity. After the market's close, one can see his type by the thousand traveling uptown in cabs, or on the elevated or subway trains. Obsessed by a financial narcosis, perpetually either in a hectic state of depression or high elation, his is the life of the hasheesh dreamer. Generally he is a man who is gambling away his income in the market. Often he is dissipating an inheritance, or speculating with the funds of an estate of which he is trustee.

Again, the ticker fiend may develop into a "tape reader." Ignoring the news and economic conditions, the victim of this hallucination imagines he can read coming market movements out of the hieroglyphs of the tape, as Roman augurs read the future from the entrails of birds.

Brokers Encourage Gambling in Stocks

ANOTHER stock gambling addict is the "chart fiend." Paper tablet and pencil in hand, he sits all day recording price movements, as he watches two boys jumping to and fro, sticking green slips of pasteboard into wooden slits on the quotation board. If a stock jumps up, reacts and touches the high spot again, he theorizes that it is time to sell the market short; if a stock returns to its previous low quotation, it is time to buy. His whole life consists in watching for "double tops" or "double bottoms."

Stock speculation represents the greatest economic waste in the social system. Its attraction is that of the lottery, the race track and the roulette wheel. Its inherent danger lies in the fact that its operations are clothed with an air of alleged respectability.

But stockbrokers encourage the delusions of speculators, and employ skilled and plausible men to surround them with all the glamour of allurement. The speculative spirit of the public is whetted by trained writers of innumerable financial journals, ranging from the dignified monthlies down to the crooked market letters sent broadcast by the bucket shops in New Street.

It may appear incredible to many persons that even the most eminent *banking* houses, whose presidents posture as the financial leaders of the country, do not scorn to play upon this human weakness. Financial publications, dependent upon Wall Street patronage, carefully refrain from commenting on this fact. Therefore it may be of interest to describe the actual campaign by which a powerful *banking* group set the vast machinery of Wall Street in motion to unload upon the public the securities of a corporation whose credit they had extinguished.

The Missouri, Kansas & Texas Railway is taken as the classic example, because of the recency of the occurrence, the fact that the means taken were so simple and plain, and the men concerned were the highest in the Street.

Previous articles have related how a Wall Street ring of railroad speculators obtained control of the Katy by buying a majority of the stock. An executive committee was formed to manage the road, the three most prominent members being the president of a great national bank, the president of a large trust company, and the partner of a Jewish private banking house, whose head was the financier of the Katy.

When this prosperous property fell into the hands of the ring, its members proceeded to enrich themselves. The road at this time had in its treasury a surplus of $8,000,000 in the form of bonds, which had been accumulated over a period of years by the previous owners of the road. This amount was dissipated, at a cost to the railway of $1,389,400 in discounts and commissions to the bankers to whom the bonds were sold.

A program of mad financing was inaugurated. By the end of four years of mismanagement, the Katy had been milked dry.

The members of the ring had now brought matters to a desperate pass. Originally, they had made a loan of $2,000,000, which in four years they had run up to the sum of $17,500,000. This amount was now due. If not met at once, the road faced bankruptcy.

Annually, the Katy earned more than $20,000,000. But, due to the extravagance of the ring, at this moment the amount in the treasury representing the net profits for the year was the small sum of $17,168. There had yet to be accounted for the amount of $382,112, for the discount on notes sold to the bankers. In addition, there must be paid a dividend of $520,000 on the preferred stock.

In other words, $902,112 had to be accounted for, and there was but $17,168 to meet it. This was exclusive of the huge debt of $17,500,000 which loomed in the background.

Trained in the black art of railroad finance, the railroad group had tried various expedients to raise more money for themselves.

They had tried to convert the stock of a subsidiary, the Texas Central, into bonds, but this scheme had been frustrated by Governor Colquitt, of Texas, who evidently distrusted the schemes of the ring.

They had tried to sell debenture bonds, but the public would not bite.

How Schemers Tricked the Public

THEY had tried to sell consolidated mortgage bonds. These were unsalable from their very nature. Their collateral would not bear inspection.

Indeed, it was high time that something was done. These financiers had not bought the Katy for investment. They had acquired the railroad to make money. Now they determined to make the public foot the bill.

The Katy, as we have seen, was merely an empty shell. It was necessary for the bankers to create the false impression that it was highly prosperous.

The debt of $17,500,000 was due in May. To meet it, the plan was adopted of issuing $19,000,000 in attractive short-term notes, which were to be sold to the public. This would net the ring a fat profit of some $1,500,000.

There had been listed on the New York Stock Exchange, $63,300,300 in common stock and $13,000,000 in preferred stock of the Katy. For the last four years, three pools had been in operation, milking the market in these shares. The schemers now planned to work these stocks up to the highest possible price, by spreading false rumors about their value, and then unload them definitely upon the public.

To carry these two plans into effect, it was necessary to pay the dividend of $520,000 on the preferred stock, which had not been earned during the year. However, the dividend was declared, and was charged to *a fictitious bookkeeping surplus.* There were two very necessary reasons for this action. Under certain state laws, railroad securities are not eligible for savings bank and insurance company investments, unless the stocks of such roads have paid dividends of at least four per cent for a successive number of years. In the second place, it would have been impossible to sell the Katy stocks had the dividend been passed.

The game was now in sight. The whole country was the field. The hounds were scenting the quarry, and straining at the leash. But their masters still held them in check.

It is a difficult and delicate matter artificially to work up sentiment in favor of a corporation's securities. The public appetite must be whetted for the stocks, and the directors of savings institutions must be duped into a receptive frame of mind.

The first step taken was to *invite the financial editor of a New York newspaper* to make a tour of the Katy system. A pamphlet was then published, in which a favorable report was given of the program of the railway management, describing the excellent results which had been achieved or were anticipated.

The next step was to *make it possible to plant Katy securities in life insurance companies.* The question was raised by the New York State Insurance Department concerning the legality of an issue of equipment notes of the Katy. Due to representations made by the officials of the ring, a decision was obtained that "railway equipment notes, issued under conditional sale agreements, for the payment of which a solvent corporation of the United States or of a state is liable, are legal investments for the surplus funds of life insurance companies."

Now proceedings were begun to work up a market for the large note issue. The following notice was published in the New York *Times* and other publications whose main revenue is derived from Wall Street advertising:

> Evidence of a slowly improving demand for investment securities was seen yesterday in the sale of $19,000,000 two-year five per cent secured notes of the Missouri, Kansas & Texas Railway to Speyer & Company. The proceeds will be used to take up $17,500,000 notes due or called for payment May 1, 1913, and for other corporate purposes. They are secured by deposit of $24,000,000 consolidated mortgage five per cent gold bonds.

It will be noticed that the collateral behind the notes consisted of the issue of consolidated mortgage bonds, which the Katy ring had been unable to sell because of the nature of the security behind them. The notes now being offered were substantially the same security, only they had been issued in a more attractive form to delude investors.

Reputable Man Used as Tool

WALL Street adopts the principle of "window dressing" in selling its securities, just as a merchant does who sells his wares.

A few weeks later a formal offering of the notes was made to the public in large advertisements, which were inserted in publications which are supposed to appeal to investors. These said in part:

> Speyer & Company will receive subscriptions at 98 for the $19,000,000 notes. Frank Trumbull, chairman of the board of the Missouri, Kansas & Texas Railway Company, in a letter dated April 18, 1913, writes us in part as follows: "The average annual surplus of the Missouri, Kansas & Texas for the five fiscal years ending June 30, 1912, after providing for all fixed charges, taxes, rentals, and so on, amounted to $1,108,381. For the eight months ended February 28, 1913, the surplus of the Missouri, Kansas & Texas, after providing for all fixed charges, taxes, rentals, and so on, was $2,693,120.25, an increase of $2,321,367.50 over the same period of the previous year."

This statement was as deliberately disingenuous as the misleading prospectus of a shady mining broker. I regret to state this, because I had known Mr. Trumbull for many years. As the creator of the Colorado & Southern road, he had made an enviable record in the railroad world. But the attitude of Wall Street bankers toward railroad builders, and how they use such men to do their bidding, is another story. A prominent banker, a former associate of the railroad builder, told me only the other day that Mr. Trumbull, to the end of his life, bitterly regretted the part which he was compelled to play in the disastrous affairs of the Katy.

Mr. Trumbull's assertion was deceptive, in that it implied that the previous year's surplus had amounted to more than one million, whereas we have seen that the surplus after charges was only $17,168. The attempt to show a huge increase in surplus was, therefore, intended to hoodwink investors.

Paid Unearned Dividend as a Bait

AS A matter of fact, the surplus in 1913, for the 12 months, was afterward shown to be $2,316,985, and Mr. Trumbull knew that this entire amount had been swallowed up by hidden charges, of which two only need be mentioned:

Discounts and expenses of security issues	$ 908,724
Preferred dividend for 1913	520,000
Total	$1,428,724

The discount and expenses entailed by selling the $19,000,000 notes to the bankers, amounting to close to one million dollars, shows how the profits of the Katy were eaten into from year to year.

As for the dividend, which was not earned in 1913 any more than it had been in 1912—it had to be paid in order to float the sale of the notes and stock. Incidentally, it was the last dividend that was ever paid on this issue of Katy shares. And the members of the executive committee of the railway board were well aware of these facts.

A clever publicity campaign was now pursued to render these notes attractive in the eyes of potential purchasers. Wall Street justifies such tactics. The bankers claim exemption from consequences by quoting their favorite maxim: *caveat emptor,* "Let the buyer beware."

The campaign included artful press notices such as this:

> At the office of Speyer & Company it was learned yesterday that subscriptions for the new

Would You Turn Your Back on a Fortune?

Story of an Heir to Millions Who Became a Wandering Hobo

By ALBERT SIDNEY GREGG

YOU probably have seen items in the newspapers relative to James Eads How, of St. Louis, the "millionaire hobo," and have asked yourself questions about him and his peculiar ways.

Is he really rich? Is he actually a hobo?

Why does he live such a strange life, when he might be enjoying all the advantages of a very wealthy man, with a solid and well-invested fortune?

The short answer is that How seems to get a lot of satisfaction out of being a hobo. And, if he gets satisfaction, what more is there for him to get? Furthermore, it is strictly his own affair.

When I asked him about it he replied:

"Read the sermon on the mount, and perhaps you will find the answer."

To some of his comrades of the road How has said:

"It sounds strange to me for a millionaire to say that he wants to die poor. I think it is much better for him to live poor."

James Eads How is a grandson of Captain James Eads, railroad builder and international promoter, who first proposed the Nicaragua Canal, and later made a place for himself in history by building the Eads Bridge over the Mississippi River at St. Louis. James F. How married Eliza A. Eads, and to them two sons were born—James E. How and Louis How. In the course of time the estates of Captain Eads and Mr. How passed to Mrs. How and at her death the fortune was divided between the boys. Nobody seems to know the actual value of his inheritance, but it runs into many millions. It consists of bank and railroad stock, industrial investments and houses and land in St. Louis. The family connection on both sides is extensive and powerful in finance and politics.

Before the death of Mrs. How, James E. had shown signs of his revolt against inherited wealth.

"Why should I enjoy all this?" he would exclaim. "I did not earn it."

He carried his views so far that he would not let the butler or other servants wait on him. While he still occupied a room in the Lindell avenue mansion, St. Louis, James E. got his own meals in the kitchen, where he could serve himself.

He became so generous that his mother was afraid he would soon part with his fortune. Hence in her will she gave him one-fourth of the property outright, and put the other fourth in trust for him for life. The entire estate is handled by a St. Louis trust company.

Louis How is a painter and poet, who spends most of his time in Rome, while James E. has become king of the hobos, and founder of a unique organization for doing away with hobos, tramps and bums. To better understand persons, James E. How became a hobo himself, and for 20 years he has wandered over the United States, riding in box cars, counting railroad ties, working at odd jobs, sleeping in "flop houses," and taking part in "jungles" composed of hobos, who build a fire by the roadside and cook "Mulligan stew" for dinner. When he goes back to his old home town of St. Louis, he stays at a lodging house, where he can get a bed for 15 cents a night. The Lindell avenue mansion has no attractions for him, now that his mother is no longer there.

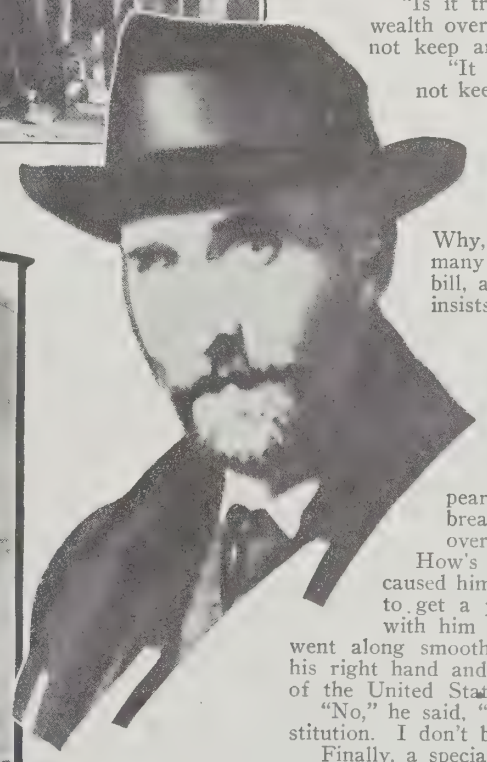
How does not use a cent of his income for his personal needs. He has set it aside for the benefit of hobos, and earns his own living in a very humble way. His favorite occupation is washing dishes and scrubbing floors. He also is an expert at peeling potatoes.

In crossing the Atlantic, which he has done a dozen times, How works his way, sometimes as a mule tender, but in most instances as a kitchen worker. On one occasion he traveled in the same steamer with his mother. Mrs. How had a suite de luxe, and was accompanied by her maid and attorney, while James E. worked his passage by helping the cook. Neither knew the other was on board. The lawyer found it out, however, and he is the one who told me the story.

How is well educated. He passed through the regular grades, and later graduated from the College of Physicians and Surgeons in St. Louis with the degree of M. D. Then he studied sociology and economics for a year at Oxford, and finished off with a year in medicine at Harvard.

With all his apparent aimlessness, How seems to have a very well-defined purpose. The net result of his wanderings is the formation of the International Brotherhood Welfare Association, incorporated, not for profit, under the laws of Ohio. A committee of five "comrades" appointed by this association disburses the income from How's estate.

As fast as the income accumulates in St. Louis it is transferred to a Cincinnati bank, where it is held subject to checks signed by at least three members of the "holding committee." The money is used mostly for the erection and maintenance of halls or stations for the benefit of hobos, tramps and bums in Cincinnati, St. Louis, New York City, Baltimore, Philadelphia, Denver, San Francisco, Chicago, Kansas City, Oklahoma City, Memphis, Louisville, Boston, London, Dublin, Stockholm and Tokyo. How furnishes all the money to keep these institutions going.



The building in Cincinnati is a fair sample of the entire system. It is a three-story brick structure at 410 Clinton street. The top floor is given up mainly to a hall seating 800. On the first and second floors are classrooms and the office, while in the basement there are facilities for bathing. Hobos and tramps come and go as they please, without leaving names or addresses. Anybody can use the hall for a meeting without permit or price. How's idea is to provide some measure of education for the "disemployed," as he calls them. At several of the hobo stations, notably in the eastern cities, regular lectures on economics are given, which are followed by discussions. At this writing a "Hobo College" is under consideration and such an institution may eventually be started in Memphis. How does not believe very much in organized charity. His view is that if a man is inoculated with sound economic ideas there will be little need for relief work. He seems to be trying to answer the question: "Why is a hobo or a tramp and what can we do to help him?"

A group of hobos at a convention; James Eads How is in the long coat.

One of the "hobo stations" maintained by James Eads How. This building is in Cincinnati, and is the international headquarters of How's activities.

JAMES EADS HOW,

Who surprised San Diego, California, recently, by riding into town in a regular Pullman, thus departing from his regular custom of the "side-door Pullman" method of travel. He announced that he had to be "stylish" because he intended starting a "hobo college."

When I asked How to estimate the number of hobos in the United States he said:

"Nearly 18,000,000."

"The number depends entirely on the definition of the word hobo," added one of his associates, Nicholas Klein, of Cincinnati, How's attorney. "We make a sharp distinction between hobos, tramps and bums. Our definitions are: A hobo is one who travels in search of work, the migratory worker who must go about to find employment. Workers of that sort pick our berries, fruits, hops, and help to harvest the crops on the western farms. They follow the seasons around, giving their time to farms in spring, summer and autumn, and ending up in the ice fields in winter. We could not get in our crops without them, for the hobo is the boy who does that work. The name originated from the words 'hoe boy,' plainly derived from work on a farm. A tramp is one who travels but does not work, and a bum is a man who stays in one place and does not work. Between these grades there is a great gulf of social distinction. Don't get tramps and hobos mixed. They are quite different in many respects, the chief difference being that a hobo will work, and a tramp will not, preferring to live on what he can pick up at back doors as he makes his way through the country."

As designated by How himself, the holding committee that expends his money, comprises John X. Kelly, of Chicago; Robert W. Irwin, of St. Louis; Charles Kruse, of New York; William Quirke, of New York, and Nicholas Klein, of Cincinnati.

How picked these men in his own peculiar way and put them in charge of his money. They are all regular hobos, with the exception of Klein, who is a well-known attorney in Cincinnati. For 15 years Klein has looked after the legal business of How.

While Klein is familiar with hobo life and habits, he is not a "migratory worker" in the sense that others are hobos. He has picked up a wide range of information relating to this subject, and keeps in touch with many individuals who live in hobo land.

After we had talked for a long time, I asked Klein the question uppermost in my mind, and also uppermost in the mind of all who come in contact with How:

"Can you explain why Eads How lives as he does, when he might be enjoying his wealth like other rich men?" I asked.

"Only in a general way," replied Klein. "How feels that his mission is to the underdog, and he has deliberately sought out the most unpromising members of society he could find—the wanderers who have no homes. His stations or halls are the nearest to a home any of them have. Hobos and tramps are coming and going all the time. 'General Delivery' is their only address. How's plan to build them rallying points in large cities is about as good as could be devised, especially as he gives them absolute freedom."

"Is it true that he has actually turned his wealth over to this holding committee, does he not keep any money for himself?"

"It is true," replied Klein. "He does not keep even a personal checking account If he wants any money he must ask this committee, and if it should refuse to give him any he would have to sue to recover his estate. The situation is such that his check would not be honored. Why, he has borrowed a quarter from me many a time. He always gives me a due bill, and when he returns the quarter he insists on getting the due bill back, which indicates good business sense.

"I coaxed him out to my house one night, but when he reached my place he insisted on sleeping in a servant's room. So we fixed it up that way. The next morning when I went to call him for breakfast he had disappeared. My idea is that he left before breakfast to avoid any embarrassment over being waited on by a servant."

How's independence of thought and action caused him no end of trouble when he wanted to get a passport to Stockholm. Klein was with him to arrange the details. Everything went along smoothly until How was asked to raise his right hand and swear to support the Constitution of the United States.

"No," he said, "I cannot. I can't support the Constitution. I don't believe in killing people in war."

Finally, a special oath was fixed up by which How was allowed to "affirm" his fealty to the American Government.

One night How dropped off in Kansas City, and found a gathering of his kind in progress. It was composed of men with a grievance, and How thought he saw a chance to make a speech. Armed with a typewritten copy of the preamble to the Declaration of Independence, How was ready for his opportunity when the police raided the place and carted the crowd off to police court on the charge of holding an anarchistic meeting.

The officer, who grabbed How, snatched the typewritten sheet out of his hand, read it, and then bellowed:

"Did you write that? Why, that's anarchy."

"Oh, no," replied How, in his usual mild manner, "Tom Jefferson wrote it."

"That's enough. Where is this fellow Jefferson? We must arrest him."

Of course, the policeman did not find Jefferson, but he took How. Klein was on the job the next day and obtained his client's discharge.

"Tell me," I exclaimed addressing Klein, "what, in your judgment, started How to going as he has been going for so long."

"Nobody really knows, but I suppose my guess is as good as any," was the reply. "A lot of it is due to an inherited propensity to help others. His passion is to help the fellow who is down and out, and the lower down he is the better How likes the job."

"Has he done anything to make his work permanent?"

"Yes, as far as money is concerned," was the response. "His will provides that his estate shall be administered by the holding committee just as it has been since the committee was created. One provision is that the committee cannot spend more than 10 per cent of the principal in any one year, but may use all of the income. But this may not come for some time. How is a little past 50, but he is very rugged."

How Neglected Alaska Is Being Throttled

"Interests" Accused of Preventing Development of Great Territory

By ROBERT KENTON

This is the first of two articles on why Alaska is not being developed. The second will appear in an early issue.

"IF CONDITIONS don't change and that pretty soon," a man well-informed on Alaskan matters declared in Washington recently, "the government actually will have to provide means for getting much of the white population still remaining there out of Alaska."

Our big territory in the Far North clearly seems to be in a very bad way, in a much worse way than is explained by the war or the recent business depression. During the past 12 years white population there has declined one-third or more.

The vast region which some who know it well say is the naturally richest on the globe is now supporting a resident population of only a little more than 50,000. The 1920 census disclosed a resident white population of only 27,883; the 1910 census gave the territory a white population of 36,493. It is declared that since the last census was taken the population decline has continued, and perhaps more rapidly than before. During the last decennial period the Indian population increased slightly, but there are fewer Indians in Alaska now than were there in 1900.

A detailed narration of the natural wealth of Alaska would call for figures so large as to be beyond comprehension. Virtually all the minerals are there, the important ones in greater abundance than anywhere else on the continent. The world's greatest fishing fields are within the Alaskan area. There are millions of acres covered with forest trees. The climate in much of the territory is not severer than that of the border states of our southland.

Some enthusiasts about Alaska's possibilities go so far as to say that the territory is capable of supporting a resident population of not less than 50,000,000.

Yet, though Alaska has been a part of the United States since 1867, the lands as rich as ever found in the West may be homesteaded there, no encouragement is or can be given the poor man or the man of little means to settle there at this time.

Alaska has suffered from governmental neglect; in all the years that we have possessed the area Washington has never had a well-defined or fixed policy with regard to Alaska. But of the approximately 25,000 persons now resident in the territory, it is stated, about 3,000 of them are officials or employes of the government, which shows that Washington pays some kind of attention to Alaskan affairs.

Since 1915 the Federal Government has spent more than $50,000,000 on a railroad, extending from the coast nearly 500 miles into the interior of Alaska. To be exact, a total of $52,000,000 has been appropriated for the railroad, which, when planned, was expected to cost only $35,000,000. Another appropriation of $4,000,000 is pending. The railroad was constructed to open and develop the territory.

Yet there is less business along the line of the railroad and at its terminals than when the first rail was laid in 1915, and less prospect of supporting traffic for the railroad.

But figures covering Alaskan commerce by no means are negligible. Products shipped from the territory to the States in 1920 had a value of $69,911,442—"more than $1,250 for each man, woman and child—counting both white and native" in the territory. Since 1867, when we purchased Alaska from Russia, we have taken more than $1,000,000,000 in wealth from there. During recent years the commerce of the territory, both inflow and outgo, has amounted to about $100,000,000 annually.

Most Alaskan business is carried on by big corporations, owned in and directed from the States. The bulk of the fisheries business, especially the canning—fish comprising the territory's largest industry—is done by large concerns, which use their own boats and send much of their labor to the territory only for the season of active operations. Nearly all the mining now being done is by what are known as the Morgan-Guggenheim interests. They own and operate what is reputed to be the richest copper mine in the world at Kennicott, Alaska, and they own the railroad which reaches it from the coast, and another mine near the coast at LaTouche. They own and operate a steamship line, which, together with the Pacific Steamship Company, controls all traffic between Alaska and the States. Some believe that they have an interest in the other line, the ownership of which is not apparent. Anyway, the two lines operate in apparently complete harmony. The same rates prevail on both. Lately, it appears that the two Alaskan vessels operated by the Alaska Steamship Company, which is the Morgan-Guggenheim line, have dominated the traffic situation in that part of Alaska touched by the government railroad. Only one vessel belonging to the other line, it is declared, has been operating in that part of the territory, others going to other regions. The so-called Morgan-Guggenheim interests in Alaska are a branch of the giant mining and smelting syndicate controlled by the Guggenheim brothers of Utah, Colorado and New York City. It includes mines scattered over the continent and smelters situated in many sections of the States. It includes the smelter at Tacoma, Washington, to which is sent all Alaskan ore calling for treatment in a smelter. Part ownership of the Alaskan concerns is held by the Morgans, but the majority stockholders are the Guggenheims.

The names of the Guggenheims figured prominently in the Pinchot-Ballinger controversy of 10 years ago. The controversy grew out of the alleged attempt of the Guggenheim interests to get control of vast coal lands in Alaska. They already owned and still possess considerable Alaskan coal, but the bulk of the coal lands in the territory are still public property.

Since the Pinchot-Ballinger controversy little has been heard of the Guggenheim interests in connection with general Alaskan affairs.

At recent hearings in Washington they were heard of again and rather sensationally. In fact, it was charged that the Morgan-Guggenheim interests in late years have been pursuing a throttling policy toward all interests in Alaska except their own. The most specific charge was that they use their dominance in the shipping situation to bring about such high transportation costs between the States and Alaska as to make life and successful effort very difficult for the average resident of Alaska. Other sensational charges of a character that should command serious investigation were made.

Some were made by John Rustgard, attorney-general for the territorial government, and similar ones have been put forth by Dan A. Sutherland, delegate to Congress from the territory.

But the most sensational charges were set forth by John E. Ballaine, of Seattle, Washington, who for long was a resident of Alaska and who made a long journey through the territory last summer and autumn. He at one time had extensive interests in the territory. He organized the Alaska Central Railway, which is now a part of the government railroad, and was a leader in the movement which led to Congress deciding on the construction of the government railroad.

Mr. Ballaine went so far at recent hearings as to accuse the Morgan-Guggenheim interests of using their power and influence to impede the success of the government railroad in the hope of getting private control of the property. He declared that the man who was chief adviser on Alaskan matters to the late Secretary Franklin K. Lane, of the Interior Department, was under the influence of those interests. The railroad comes under that department, which fixes the rates charged by it. Mr. Ballaine said those rates have been made so high as to cause all the mines along the road to close down on account of inability to meet profitably the cost of transportation, and he accused the former adviser to the then Secretary of the Interior of responsibility for those high rates. The adviser in question was J. L. McPherson, of Seattle, until recently secretary and manager of the Alaska Bureau of the Seattle Chamber of Commerce. Mr. Ballaine declared that the Alaska Bureau in question was dominated by Falcon Joslin, president of the Bering River Coal Company, a Morgan-Guggenheim property in Alaska, and otherwise associated with those interests, and by others more or less under the influence of the Guggenheims interests. He named several others,

Above—Along the line of the government railroad in Alaska. Below—A few pioneering homesteaders are making a gallant fight for the establishment of agriculture in Alaska. But, it is stated, many of them have been forced to abandon their efforts.

In our picturesque region of the Far North, said by some to be the naturally richest area on the globe. Though we have possessed it for fifty years, there are not more than 25,000 white residents there.

among them Nathan Eckstein, a wholesale grocer, and J. L. Heffernan owner of a steel and iron works, both of Seattle. He declared that both of them did considerable business with the Morgan-Guggenheim concerns and were strong in the affairs of the Alaska Bureau of the Chamber of Commerce. He also said that the Seattle Chamber of Commerce itself was until recently dominated by men under the influence of the Morgan-Guggenheim interests.

His accusations, of course, met with prompt denial and some of his specifications seem to have been fairly well contradicted. But a careful examination of the record of recent hearings before both House and Senate committees, together with evidence put forth more recently by the Alaska delegate, certainly doesn't make it clear to one mind, at least, that either the skirts of the gigantic interests figuring in the charges or those of Seattle are entirely bare of blame for the almost tragic predicament reached by the affairs of Alaska.

Virtually every one speaking at the hearings declared that transportation, and especially ocean transportation, is the chief key to the solution of Alaska's difficulties. For the territory, though almost an entire forequarter of the continent, is in an economic sense a remote island of the sea. It can be reached successfully by water alone. Hence, no matter what transportation facilities may be developed within the territory, industry there for the present cannot prosper without easy and cheap means of traffic beyond the territory and especially to the States.

Just as water transportation is the key to the solution of Alaska's immediate economic difficulties, control of facilities for carrying on traffic with the territory amounts to at least potential control of Alaska's destinies. Thus, private interests, whose once alleged designs on the public wealth of Alaska caused a great agitation which led to the apparent negativing of all such designs, seem to have gained a position of peculiar supremacy with regard to Alaskan affairs.

Such at least seems established by facts put forth in Washington by Messrs. Ballaine, Rustgard and Sutherland, the last two being high officials of the territory.

Mr. Ballaine, for example, declared before the United States Senate Committee on Territories last fall that the deep-sea fishing activity out of Seward had been suspended completely because of the excessive cost of transporting the catches to Seattle and the uncertainty of shipping service.

"The Alaskan Steamship Company handles first and primarily its own business," he said, "and handles secondarily the business of other people. It charges the public from $10 to $37 a ton for handling its business and charges itself $4 a ton for handling its ore from Cordova and Kennicott.

"Rates from the Pacific ports to Europe via the Panama Canal, a distance of approximately 8,000 miles, are less than the rates charged by the Alaska Steamship Company to Alaska—Cordova and Seward—a distance straight across from Seattle of 1,210 miles.

"When I came down from Alaska this fall the cold storage warehouse at Seward was filled with 500 tons of frozen halibut. The Alameda was able to take only 40 tons and no more. They were reserving space for 200 tons of ore taken at LaTouche from a mine owned by the same interests as the steamship company, and for 600 tons of ore to be taken at Cordova, and they passed up some canneries that were anxious to ship out some herring and canned salmon.

"The result has been to kill off all fishing industry around the terminus of the government railroad and to prevent the building up of a population there, which would furnish a market for the products of the farmers along the line of the railroad."

He charged that by contract, which guarantees it all the business, the Morgan-Guggenheim steamship line gets $12.50 a ton for carrying rails for the government railroad from Seattle to Seward. Three rails, he said, weighing 2,100 pounds each, filled a space within a few inches of 12 cubic feet. This meant, he declared, that the government paid $1.04 a foot for rail space. For ore, he declared, the steamship line charged $4 a ton, which, on a space basis, would be about 15 cents a cubic foot.

Mr. Ballaine quoted letters from mine operators on the government railroad to the effect that rates fixed for transportation to the coast were, together with those for transporting it to the smelter at Tacoma, so high that every mining operation along the railroad line had been compelled to suspend. He declared that a report made by the United States Geological Survey showed that in 1915, when construction began, 33 mining operations, employing between 1,000 and 2,000 men, were under way in the territory tributary to the government railroad.

He introduced a letter from Mark Flatow, manager of a mining venture financed by Newark, New Jersey, people, which Mr. Ballaine declared showed that the freight tariff "amounts to $16 a ton between Seward and Anchorage, a distance of 114 miles."

Mr. Ballaine added: "I do not know of any other railroad rates in the world that are as high. The result has been to kill every kind of mining industry between Seward and Anchorage. There is today not one single man employed in any mine between those places, although the Kenai Peninsula is one of the richest lode districts in the whole of Alaska."

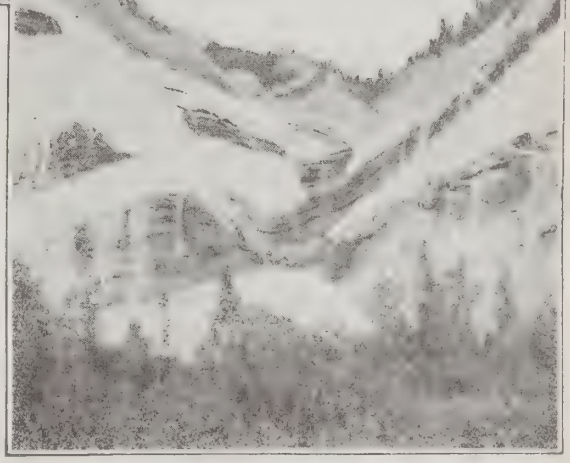
He declared that the rate policy of the railroad had been shaped through influences brought to bear by the Morgan-Guggenheim interests, which he accused of wanting to discredit the railroad venture so that it would drift into their hands.

A significant letter introduced into the hearing was from E. E. Chamberlain, a member of the Alaska territorial senate.

Above—Bird's-eye view of the town of Seward, the ocean terminus of the government railroad in Alaska. It gives an idea of the enrapturing scenic beauty which surrounds the vast undeveloped natural riches of the territory. Below—The government railroad in Alaska is well built. The cost will be approximately $50,000,000, but it threatens for the time being to be very much of a "white elephant."

"The steamship monopoly that controls transportation between Alaska and the States," the Senator wrote, "is owned by New York interests that are engaged primarily in exploiting Alaska's mineral wealth, its fisheries and its timber. Their boats serve their own interests first at cheap rates and give the public what is left at extortionate rates. The owners of this monopoly have opposed development by any other interests and are particularly vindictive against the government railroad and the country tributary to it."

Another document of significance submitted by him was the second memorial, amounting to a legislative act subject to congressional approval, from the territorial legislative asking Congress for permission to float a $5,000,000 bond issue to raise funds with which to establish a line of steamers to be owned by the territorial government.



The preamble declared that the burden imposed by the shipping interests was "a tax upon the very existence of the territory and a grave and ever-increasing menace to its development."

A similar memorial passed at a previous session declared that the "high cost of transportation and the inefficiency of the present system to supply the needs of the country have so crippled the industries as to drive a large percentage of the white population out of the territory and threatens the industries thereof with extinction."

Mr. Ballaine declared that in every effort he made to get the Interior Department, when under Secretary Lane, to bring about a better rate situation on the government railroad he "met with the constant opposition of Mr. McPherson and Mr. Joslin. Mr. McPherson's plea was that it is not the business of the government railroad to engage in any kind of development." He absolved former Secretary Lane of all blame, saving that the secretary himself learned finally that he had been deceived.

He accused Mr. Joslin of having used the influence of the Alaska Bureau in Seattle in inducing the government to pay $300,000 for what he described as the "Joslin railroad or the Joslin tramway, a run-down tramway built of second-hand material which cost in the beginning about $240,000," running, he said, through what had become an "exhausted district." Joslin asserted, in denying the charge, that the road had cost about $1,000,000.

Mr. Ballaine also accused the Alaska Bureau of doing what it could to hinder the development of Alaskan coal for use by the navy, which, it seems, carries across the continent from the eastern states most of the coal it uses in the Pacific, despite the fact that there is an unlimited amount of excellent naval coal on a branch of the government railroad in Alaska. Officials of the bureau, however, presented documents which showed that they were at least on record as favoring the use of Alaskan coal by the navy.

Some of the seams of coal which serry the Alaskan hills measure 60 feet in depth. The ones shown in the picture are only three miles from the government railroad.

"Whoever controls the coking coal of Bering River and the Manatuska districts," Mr. Ballaine declared, "controls the smelting industry of Alaska; and whoever controls the smelting industry of Alaska controls absolutely the hard-rock mining industry in the territory, perhaps worth figures so great that they are beyond conception. They (the Morgan-Guggenheim interests) have been directing their efforts constantly to get through Congress legislation which would enable them to have a monopoly of both those fields, supplying the only coking coal in Alaska and most of the coking coal from the end of Cape Horn to Bering Sea."

Whatever may be the truth or falsity of Mr. Ballaine's allegations—and it is hard to believe that the business interests of Seattle, a city which was made by and whose future depends largely on Alaska, would hinder the development of the territory—much of what he charged seemed to be backed by evidence which at least establishes grounds of serious suspicion concerning the attitude of the Guggenheim interests toward other interests in the great territory.

Some things that the attorney-general of and the delegate to Congress from the territory have had to say about the situation will be recited in another article.

Our "Assistant Government" in Washington

Concluded from page 2

bloc," for no one has any patent on the game as now generally played in Washington.

The game as played with regard to Washington affairs was perfected as a forceful measure largely by the Anti-Saloon League in bringing about the adoption of the Eighteenth Amendment. The league showed how by concentrating on a single thing and bringing to bear thereon the weight of a large and well-distributed following, Congress could be compelled to do what it frequently at heart is much opposed to doing. For whatever the popular demand for national prohibition every one familiar with Congress knows that there was no overwhelming demand for it within the precincts of the national legislature, certainly not at the time of its adoption!

The game was elaborated on by the woman suffragists in bringing about the adoption of the Nineteenth Amendment. The women played it with great effect again lately when bringing about the adoption of the maternity bill. All the women's organizations with representatives in Washington pooled their strength and organized it for the fight as a general would organize for a battle. The opposition to the bill was hopeless, for, though strong in Congress, it had no such organized and skillfully managed collateral help as did the favoring side.

Then the war showed what organization, particularly business organization, could do. Many of the business organizations that have figured in national affairs during the last several years were originated largely by the government to carry on the war.

How "Representation" Works Out

IN VIEW of the multiplicity of "assistant government" agencies in Washington one would think that no group or interest of any account is without capable outside representation there. How frequently an immense interest is not represented, while the counter interest is, was given to me by a southern congressman.

During the war a domestic potash industry was developed. It came forward recently and asked for what is tantamount to a 100 per cent tariff on potash to protect the industry from importations from Germany and territory acquired by France from Germany. Farmers in eight or ten southern states use virtually all the potash produced or imported. Its value runs from $10,000,000 to $20,000,000 a year. Domestic production amounts to not more than 20 per cent of normal need. Its representative made an able showing. The congressman tells me that there was not a single person one-tenth so well informed to appear for the other side, though its interests in the premises are immense. The proposal was adopted by the committee and has passed the House. The proposal may be a sound one; on the other hand, it is entirely possible that its acceptance was because only one side was capably "represented" during its consideration.

Business and industrial groups have copied from the campaign strategy so well employed by the Anti-Saloon League, the woman suffragists and other promoters of popular causes. They can build "back fires" just as can the big groups.

How this is done is illustrated by what a congressman tells me happened in connection with one of the bills providing railroad "relief" out of the United States Treasury. One day he began to get letters and telegrams from constituents urging him to vote for the bill, some adding—"when it comes up on Monday."

"It was my first notice that it was coming up on Monday," he says. "Men who had ties to sell to railroads in my district knew when the bill was to come up when I didn't! The word simply had been passed down to every one doing business with or desiring to do business with the railroads to press for the passage of the bill so that the roads would have money to spend with them."

All Are Propaganda Spreaders

THE bill did come up on Monday, as the appeals indicated.

When packer legislation was before them many United States senators were flooded with telegrams from constituents urging support of the packers' view. Most of those who wired had no known interest in the packing business, but when a southern senator compared some of his messages with some that were received by a western senator, it was found that the two senators received many that were of identical wording.

Thus a group whose "cause" is well directed can command much expressive support from persons outside the group. The packers, for example, do business with a great many persons and their agents throughout the country have many friends.

The approach made to a specific question by a small group is not always direct. The "oil group," as an example, is much interested in diplomatic problems having to do with Mexico. They may press their view through their lawyers and the Washington offices maintained by different Mexican oil units or through the one or more establishments conducted co-operatively by the entire group, or most of it. But for big petroleum operators to advocate a certain diplomatic policy may tend to prejudice their point of view in the public mind. They can get around that by setting up establishments that apparently bear no aroma of "oil." There are now in Washington two very innocent-appearing "association" offices which are believed to be indirect agencies of the oil operators deeply interested in Mexican affairs. Each has a "popular" aspect. A resolution calling for the investigation of their activities now pends in the House of Representatives.

But what do "associations" of that kind do? Like those maintained for the farmers or the dairymen or the coal operators and all the 200 or more groups, interests or ideas, they "propaganda-ize" in some form.

One "propaganda" method as told of in a previous article is "publicity" through the mediums that carry news from Washington. Their "publicity men" grind out "copy" in the form of "hand-outs," which are offered the press associations and the correspondents. Whenever possible they "make" news. This often is done by getting statements from men whose utterances are of news interest. They get persons to go before congressional committees and give testimony which the reporters must take account of. They often prepare data, from which members of Congress in sympathy with what they are after, may evolve learned speeches to be delivered on the floor or, more often still, inserted in the record without being delivered. Sometimes the speech itself is written in the "association" office. Though the news mediums may ignore the speech, as is perhaps the case in a majority of instances, it need not be left "embalmed" in the *Congressional Record*. A congressman may have the public printer supply him with any number of printed copies of anything in the *Record*. They are supplied at the cost of paper and press work—not by any means at total cost to the government. The same may be franked through the mails, postage free.

It is a rare and indeed dangerous bit of propaganda which some congressman won't "father" in that way—often for the sole reason that it means easy publicity for him.

Most committee hearings consist only of the claims regarding the matter in question put into the record by partisans. Only occasionally are independent investigations made, more rarely still are experts sent out to get the facts regardless of their nature. Excepting in so far as the government's own experts may speak for it, the "public" is rarely represented, barring, of course, the representation given by the committee itself. But the committee rarely has either the facilities or the time to cover the intermediary ground between the interested and usually partisan advocates of the different sides of the question.

Inspired Messages From "Back Home"

THUS an interest which has capable representation in Washington often has a great advantage, in a perfectly legitimate way. If it can get its side most explicitly before a committee, or can feed facts favorable to it to those members of Congress who are sympathetic with its contentions, it often will prevail on apparent merit, all because the other side, for lack of capable representation, is not equally well handled.

And as all public men keep their "ears to the ground" for any sounds that seem to indicate public opinion, the well-represented side usually can rally what appears to be vociferous demand for what it wants. On most of the letter and telegram tricks the average public man is immune to deception. But when, say, a member of Congress gets an onslaught of letters or telegrams which he knows were inspired by some "association's" agent with an office in a building near the Capitol, he is provided with a measure of protection against a perhaps risky action. For every person or establishment sending one of those letters or telegrams is thus obligated to defend the member against criticism in case the request made is complied with. The member also may point to a bulging file as evidence of the fact that his constituents favored the action.

"Look at the number of good people in my district who asked me to vote that way," he can say. Not one, perhaps, or very few, asked him to vote the other way, for the average voter is not inclined voluntarily to bother his congressman or senator with expressions about subjects in which he has no particular material interest.

A few attempts have been made to set up outside agencies to "represent the public" as such agencies now look after the peculiar interests of groups or individual concerns. Rarely have such undertakings been backed sufficiently as to amount to much. Frequently they are supported by persons who wish to put over their own economic or political principles. There are in Washington at least two publications which endeavor to give—and they succeed with fair success in giving—honest and impartial "studies" of important legislative matters. Neither of them has been a rousing financial success.

Activities Cause Confusion at Times

SEVERAL years ago Congress established a legislative reference bureau to be conducted as a branch of the Library of Congress. The purpose was to have an efficient agency, like several that have worked with success for state legislatures, that would be ready at any time to supply any member of Congress with all recorded facts about any subject. The appropriation for it never was large and was reduced after the first year or two of operation.

Meantime Congress, and sometimes the executive branches of the government, often flounders in a sea of confusion brought about by the activities of the multiform outside agencies making up the so-called "assistant government."

Steadily are we veering toward that theory of government that is based on the claim that if every one fights for his own selfish interest substantial and even justice for all will prevail in the end. The ultimate falsity of that theory is illustrated by a telling anecdote that is recited in one of the learned books on politics and government. A little girl was watching a large painting that gave a graphic picture of Daniel in the lion's den. The big lions were monopolizing Daniel; a little one stood off in a corner and, hungrily and hopelessly, looked on. The child burst out crying.

"Are you weeping over Daniel?" her companion asked.

"No," she replied, tearfully, "I'm crying because that baby lion can't get any of him."

Despite the vastness and the efficiency and the inclusiveness and often the genuine helpfulness of outside "representation" in Washington, John Smith, ordinary citizen, usually performs the part of the little lion. He looks on helplessly while the big lions that are dominant in the "assistant government" monopolize the attention of the real government.

Wall Street Dupes the Country With "Katy"

Concluded from page 8

two-year five per cent notes are coming in satisfactorily from the city and from the country, both from institutions and from investors.

Finally, the whole issue was successfully unloaded. the badly secured notes having been sold at the high price of $980 each. The first part in the plan of the Katy ring had been accomplished. Now the only work remaining to the railroad group was the transferring of their stock holdings to the hands of unsuspecting investors.

The great campaign in the stock market was at once inaugurated. As customary, unscrupulous financial writers were induced by gifts of stock options, to write paragraphs predicting something big doing in Katy shares.

Again, an official statement from Mr. Trumbull, the chairman, was counted on to help the game. It was issued in this wise:

> Chairman Frank Trumbull, on Thursday, after an inspection trip over the lines of the Missouri, Kansas & Texas, was quoted in part: "The Katy will earn between two and one-half per cent and three per cent on its common stock for the year ending June 30. The road was never in better physical condition."

In making this statement, Mr. Trumbull well knew that the Katy had not earned its preferred dividend for two years, and that not even a bookkeeping record could be shown of earnings on its common stock.

However, the cue was taken. Tipsters swarmed through the brokerage offices in Wall Street, boosting the Katy, and predicting that the common shares were soon to be placed on a dividend basis. News tickers sent out the glad tidings. Telegraph wires buzzed with dispatches for out-of-town consumption, advising the purchase of Katy shares.

Thanks to a vigorous campaign, men and women throughout the country were induced to invest their savings in Katy stocks, whose future showed such agreeable prospects. In Wall Street margin traders were encouraged to plunge on Katy. The whole speculative element was whipped into line on the tidal wave of the Katy boom. The ticker fiends grew excited about it, the tape readers read signs of a brilliant future, and the chart fiends were on the alert for the "double tops" which should indicate the advantageous moment for selling the market short.

Taking advantage of the furore they had created, the Katy crowd advanced the price of the preferred shares to $64.50 and the common shares to $29. Then the unloading process began. Stocks were sold cautiously to both investors and speculators.

Even while this campaign was under way, the three prominent directors of the Katy board, the president of the national bank, the president of the trust company and the partner of the Jewish private banking house foresaw the end of the gamble. They knew it would end in a crash, and they quietly and unostentatiously eliminated themselves from all connection with the Katy road.

But the whole country knows the rest of the story. The notes, which had been sold at $980, were defaulted in principal and interest. They slumped to $370. The preferred stock, which had been unloaded at $64.50, sold down to $1. The common stock, which had been landed on investors at $29, dropped to thirty-seven and one-half cents for a $100 stock certificate.

The great campaign had succeeded beyond the highest hopes of the members of the railroad ring. The $19,000,000 notes were in the hands of duped investors.

The great sum of $76,000,000 in stocks had been unloaded on the public.

The road now went into bankruptcy.

The heads of the great Wall Street banking concerns whose representatives were on the Katy board, are now opposing the insistent demand of the people for a revision of the monetary system, which might give a more equitable distribution of the country's great resources. The reorganization of the Katy is now proceeding in the hands of practically the same men who dominated the property before its collapse. The former financier of the railroad is underwriting the cash payments of the stockholders which are required to rehabilitate the system, and at the present writing, a former partner in his banking house has just been elected to the chairmanship of the Katy board.

What assurances has Wall Street given the country that the same game of exploiting the public will not be played all over again?

Champion of Humor Has Made Millions Laugh

Tom Masson's Output Is 50,000 Jokes

UP IN one corner of a great office building near Central Park in New York sits Tom Masson, champion of American humor—author, editor, poet, critic, lecturer, professional joke maker (he has written 50,000 jokes), and what not. To his friends he is a sort of literary wizard, who has done about everything from writing anywhere up to a hundred or so jokes for the comic weeklies in a single day to writing the editorials for a famous women's paper. He is a great editor who one day is starting out some young author on his literary career—and he has started a lot of them—and the next day is solving some editorial problem for a brother editor. For a quarter of a century he has edited *Life*. He has decided ideas about editing and the future of American humor.

The son of a sea captain of New Haven, Connecticut, Mr. Masson was educated largely by his father, in his boyhood days making numerous journeys to far-off countries. Later he graduated from the New Haven high school. Just to show his parents they were wrong in declaring that he could not write poetry, he began to write it. Later on, he decided that he wanted to learn to write jokes, so he promptly spent a year in studying all the humor he could find, and then began writing jokes. Success greeted him at the beginning.

Although he had been fitted for an accountant's career, and had had two years of bookkeeping experience in his teens, he switched off to journalism. When he was 16 years old he had written his first article for a little magazine that was the predecessor of the present-day *Outlook*. When he was 20 years old, he was managing editor of the American Press Association—the association when it hired him did not know of his extreme youth.

The other day Mr. Masson sat back in his chair and told something of his early adventures in the writing game. "My great encouragement in writing poetry came when my early poems were printed on the editorial page of the old New York *Sun*. Charles A. Dana was a great editor and we younger writers thought that when our work appeared in the *Sun* it was a great compliment. I saw Mr. Dana only once, when, as a young fellow, I asked the managing editor of the *Sun* if I could see the publisher of the paper. He went into Mr. Dana's office and in a few minutes came back and ushered me in. 'So you're the young man' who is writing poetry,' said Mr. Dana. 'Keep right on.' That was all there was to our interview.

"However funny it may seem, my accounting experience served me in good stead, even in the joke business, which I had gone into after a year's study of all the jokes I could find. At that time Philip Welch, the best joke writer America has produced, was at the height of his power. I credit myself with being the first efficient agent in the joke business, however. I had begun to do a little writing for *Life* and on one occasion had sent in a bunch of jokes. They were returned, but a number of them seemed to be missing. I complained, but they could not locate them anywhere. 'Look here,' I said, 'here are the numbers of the missing jokes. They must be somewhere.' With mathematical preciseness, I had devised a system of numbering and recording every joke as it went out. After a great deal of rummaging in the office, the missing jokes were found.

"Those missing jokes were the turning point in my career. It was just a little while later that I received a note from J. A. Mitchell, the owner of *Life*, asking me to call. I did so. Mr. Mitchell had been so delighted with my system of handling my own literary output that he wanted to know if I thought I could look after the paper. He wanted some one who could introduce efficiency in editorial matters. As soon as he hired me, he went away on a vacation and left me in charge."

And Mr. Masson has been literary and managing editor of *Life* ever since.

At the beginning he wrote a good part of the paper himself, but was able from time to time to enlist outside writers and artists. It is especially interesting that Richard Harding Davis, Robert W. Chambers, Rupert Hughes, Charles Dana Gibson and Carolyn Wells were all introduced to the public through the pages of *Life*.

During his literary career Mr. Masson has written approximately 50,000 jokes and has made nearly as many dollars writing them. He estimates that the average return from his jokes is $1 each, making allowance for those that do not sell, or do not bring top-notch prices. Five dollars is about the high water mark for a joke, and many have to be sold for two or three dollars. He sells, sooner or later, about 70 per cent of all the jokes he writes. Some have to be worked over again.

"One time I wrote an article telling how I wrote jokes and several hundred persons wrote in wanting to try their hand at it. But somehow they didn't get the hang of things. Joke writing is really an art," Mr. Masson explained. "It lies at the very basis of dramatic art and is the secret of good dialog. Success in joke writing depends on your being able to focus your imagination. It demands a knowledge of life. The older you get and the more you suffer, the more successful you become. When you learn to play golf, you open a whole field of joking. When you get that automobile, you learn how to write your automobile jokes. When you get married, you have a portfolio full of all sorts of jokes about married life. Of course, that is one of the difficulties of joke writing, you have to do so many things that it takes a lot of money doing them. But I suppose I have made thousands of dollars out of my golf jokes alone.

"When I first began joke writing, I found that I could not write more than 15 or 20 a day. Finally I wrote 35 and I thought I had reached the high water mark. Then I passed the 50 mark, and in time I wrote 100 in one day. A three-day output is about 150 jokes, although I must confess that after I have written 100 my mind gets groggy.

"In joke writing one simply keeps informed on what is going on. Prohibition opened an entirely new field. So did the income tax and the high cost of living. The cook is always good for some jokes. The same is true of love, society, current events, wives, husbands, babies, children. Some way mothers-in-law, barbers and tramps have gone out of style in the joke business. We must not forget the various sports and recreations. There are golf jokes, automobile jokes, poker jokes—no limit to the possibilities, just so the material is quite familiar to the majority of persons. One method in joke writing is to take the characters and build a situation around them, and the other is to take the idea and fit characters to it."

One wonders how Mr. Masson accomplishes so much. Besides keeping up his regular editorial work and writing jokes for a living, he has had time for numerous short stories, poems and editorials. One of the largest women's papers in the country once engaged him to do a large part of its editorials, and the same thing was true of a nationally known agricultural publication.

"I never let myself be chained to my job," explained Mr. Masson. "The successful editor and successful writer of today must constantly associate with other people, mix about, and get ideas and inspiration. Unless a man is constantly extending himself and drinking in new ideas, he is done for as a writer."

TOM MASSON,

Who has written 50,000 jokes—and made nearly as many dollars writing them.

Thursday and Saturday Mr. Masson does not come down town at all. These two days he spends at his suburban home in writing and reading. He aims to read all books, magazines, and a goodly number of the newspapers, as they are published. He always is picking up ideas and has an elaborate filing system. When the writer visited his office he showed him the pile of clippings that he had collected that day, all neatly classified. When he is at work he has all this material immediately available. No matter what he is writing, he aims to be able to turn and find the latest information on the subject.

Mr. Masson is strong in the belief that American journalism and American humor are getting better. "Writers heretofore have been made too much of by editors and readers," he said. "They have been taking into consideration what they think the public wants to read and have been doing their work accordingly.

"Today there are a great number of young writers growing up who are going to accomplish great things. Our literary men, too, are beginning to get their freedom, due perhaps to the rise of the newspaper.

"The next 10 to 15 years are going to show a remarkable improvement in our national humor. Up to the present time we have not been just sure of ourselves, but from now on we are going to do things."

Why Has Gold Dropped Out of Circulation?

Concluded from page 7

constantly fanned among the masses, that the "money" they handle is as good as gold. They are told that they "can get gold if they really want it." Naturally the masses are not organized—they are not analytical—they are governed by external conditions, or they could call the bankers' bluffs at any time.

Fortunately for both the banking element and the government, too, the people in general are not concerned with the elements of the gold reserve. During the last two generations gold has disappeared from circulation. It is surprising, but there are thrifty individuals in this country who don't know what gold is. It happened in Washington when William Jennings Bryan was Secretary of State. The energetic Commoner went to market one morning and tendered a gold piece to an old Negro woman, for years gracing one of the B street stalls. She refused to take it; and she refused it because she did not know it was money—the very kind of money that bankers want to talk about. Technically the former slave could have been prosecuted for refusing legal tender.

One often reads of hoards found in the most unexpected places. Not all have been hoards belonging to the proverbial misers who are depicted as churning nothing but coins of gold and silver with their scrawny hands. Yet, it is a rare occasion, indeed, when gold money is found in concealment. As a rule bills—bills of high denominations for the sake of space—have been turned up.

All these clandestine savers had no use for gold. As far as gold was concerned, it did not exist for them. Whatever it was that caused the medium in their possession to represent money, they were satisfied that it was good, and what made it good was the magical name "United States Treasury." It was this evidence of indebtedness of the government that they had confidence in, and not in the fact that it meant so many ounces or pounds of gold and silver.

Let's dig deeper. When Postmaster-General Hitchcock was dealing with the initial steps toward the establishment of the Postal Savings System he told me that this Federal bureau was not to be in competition with the banks, but was to serve as a magnet for hidden savings. When the system had been in operation two years his successor, Postmaster-General Burleson, assured me that, according to reports reaching the Post Office Department, no bank had complained about the diversion of existing funds. Only a short time ago the retiring Postmaster-General, Mr. Hays, urged legislation liberalizing the law, so as to dig out something like a billion of dollars still in hiding, according to estimate.

To my knowledge, every authority quoted in connection with the postal savings system has agreed that the hoarded treasure out of circulation is more than five hundred million dollars, although few seem to think that it is as much as a billion dollars. The lower estimate, however, seems the more plausible. But what does it mean, fundamentally, since it is not metal money that is thus concealed?

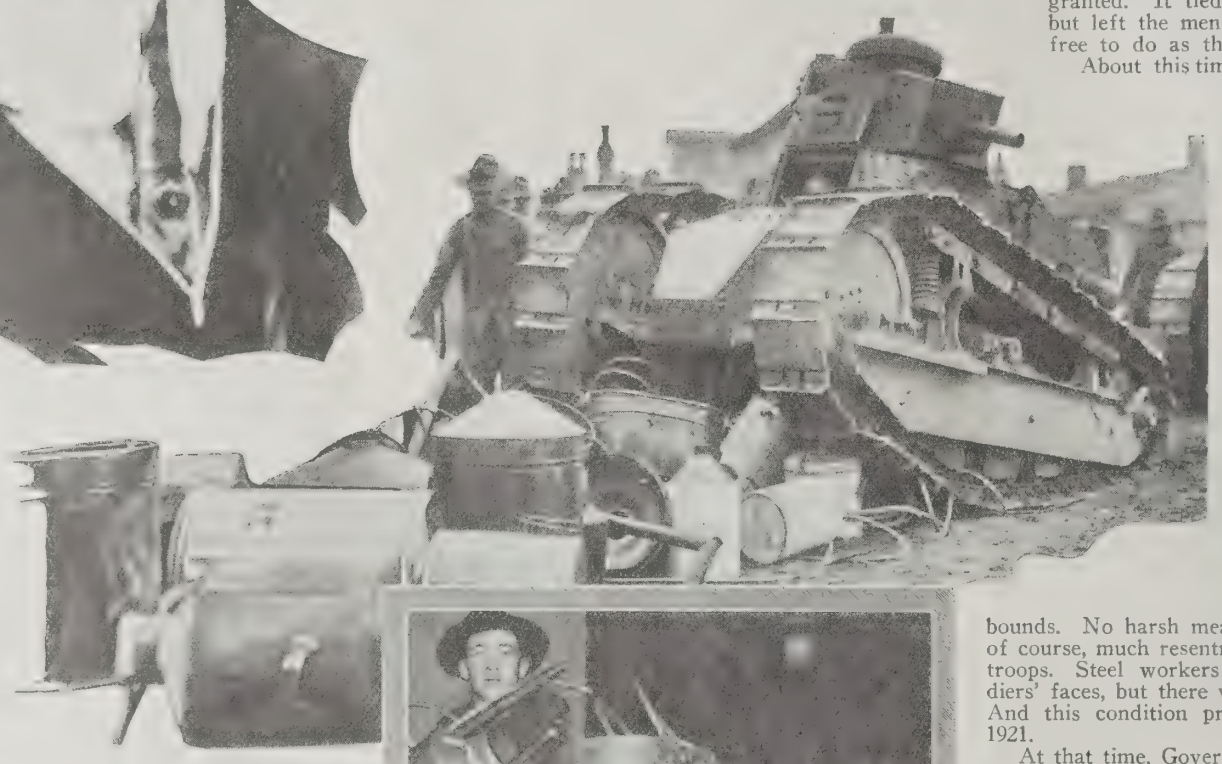
It means that the people, or some of the people, having faith in the government as the issuing power of money, retain only enough faith to intrust their money to the government. The government by law not being enabled to become custodian of more than $2,500 at any one time, prospective depositors refuse to deposit at all. In one case a single deposit of $20,000 was lost.

These individuals, few though they are, own a considerable amount, and they will not patronize the banks, regardless of the excellent prospectuses anent capital, surplus, reserves, and the like. The very people who are not sufficiently educated to appreciate the safety of modern banking are likewise not sufficiently educated to know anything about the gold standard. Nor are they the only ones. Not one man in a hundred, from any populous center, will know how to discuss the monetary standard intelligently, regardless of individual opinions as to its merits or demerits.

The trouble, therefore, evidently can be traced to the fact, already alluded to, that *finance has by imperfect legislation become the guardian of its parent, commerce.* Finance adjusts the prices of service and commodities, but it adjusts them so as to be of the greatest possible benefit to finance and not to commerce, although ostensibly the other way around. Commerce, on the positive side, is based on the fact that it is the dollar's worth—or any other arbitrary unit's worth—that we must work for; finance, on the negative side, presupposes that it is the money unit that is the object of mankind.

Largely due to this perversion of circumstances, the government today has lost its one inalienable right to govern and regulate the flow of money as a unit of exchange. How long is it since a privileged metropolitan banking house quietly bought government bonds to sell them to the public at a premium?

During the war the government gave every evidence of helplessness in financial matters; the government was unable to dispose of bonds except through the agency of private banks. The occasion was availed of by those interested to impress the people of the power of the banker in the community. Did not "the government turn to the banks of the country five times in succession in placing billions of bonds?" Are not Treasury certificates gobbled up by banks as soon as issued? The difference between what the bankers gain and what it costs the taxpayers for the "loan" is a matter of huge annual sums—lost to the government. It feeds parasitism, through faulty fiscal systems that are as crude as they are undemocratic, not to say uneconomic.



Troops and Tanks Win Fight for Law and Order

Kentucky's Military Used to End Disorder That Has Paralyzed Newport for Months

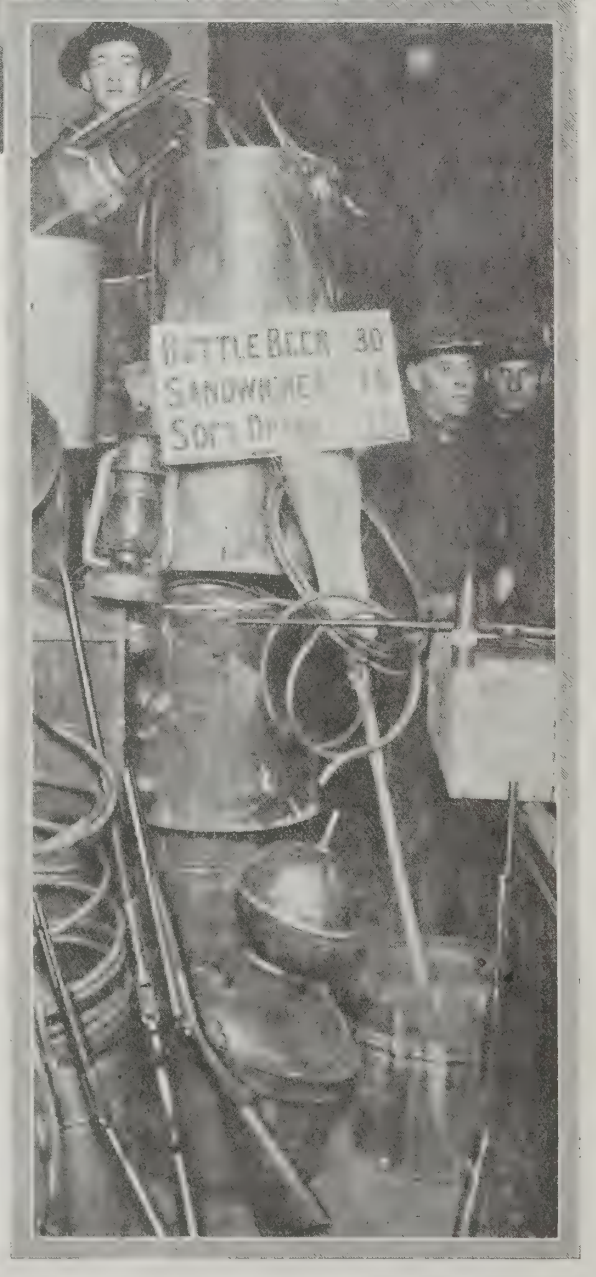
By HARRY E. BARNET

GOVERNOR EDWIN P. MORROW, of Kentucky

Tank destroying moonshine stills captured by troops in Newport, Kentucky.

FOR nearly three months a battle for decency has been fought in Newport, Kentucky. During this time 20,000 rounds of ammunition were fired. Newport is a tragedy. Years ago, its own officials, and those of Campbell County, in which it is situated, allowed commercialized vice to lay law and order on the shelf. A saying sprang up, that whatever you wanted, and whenever you wanted it, you could get it in Newport, and no questions asked. Lately, this license to the lawless broke out in revolution. All this in a community with virtually an all-American population.

These things have come to pass because of Newport's location on the south bank of the Ohio River, directly opposite Cincinnati. The western boundary of Newport is Licking River. That stream is the eastern boundary of Covington. To the west of Covington are Ludlow and Latonia, the latter being the location of the famous race track. Surrounding Newport, as well as adjoining it and one another, are several small towns and cities, including Fort Thomas, a military post.



Among the Newport population is an element by privilege—the saloon keeper, the bootlegger, the gambler, and the man who mistakes privilege for license. This element can be traced back into the last century, when Newport was a big army depot. In its early days the city clustered around the barracks, and attracted men who had no use for law and order. There has been, and is, in Newport, a class of public officials that indulges the evil element. Also, there is an element of law-abiding citizens that only sleeps in Newport. The persons of this class own businesses or are employed in Cincinnati. This element is careless. It does not go to the polls and vote; in fact, it gives little if any attention to local affairs. The law-abiding element that lives and owns businesses in Newport has never shown much courage in an open fight against commercialized vice. Good government, however, occasionally came to the surface, and asserted itself, only to fall back into the depths of despondency when it was overwhelmed by the voters of Campbell County, and of Newport.

About a year ago, business sagged, and the Newport Rolling Mills were closed. Later, the company desired to start operations, and called the members of the skilled workers' union together. The latter were told that they would be paid their demands, but that four other unions of unskilled workers would not be considered. Therefore, the members of these four unions struck and called the skilled men out in sympathy. The first action of the company was to get an injunction from the United States Court, enjoining the unions from interfering with interstate commerce. Sixty-five private guards armed with machine guns and automatic pistols were placed at the mills.

The immediate result was that the millworkers, gathered at Ninth and Brighton streets in Newport, began shooting at the mills, their fire being returned by the mill guards. Near the mills are a number of millworkers' dwellings which were under frequent fire. Terror seized the neighborhood. The situation continued, and grew worse. Strike "sympathizers" joined in the shooting, and a bad situation was made desperate by bad whisky and agitation. Law enforcement agencies were powerless to control the situation. The company was requested to remove its machine guns and its guards, but refused, claiming that it was only protecting its property and the men at work there.

A circuit court injunction was sought to prevent the mill guards from firing in the direction of the millworkers' houses. The injunction eventually was granted. It tied the hands of the mill guards, but left the men who were shooting at the mill free to do as they pleased.

About this time a movement began in Clifton to interest the Kentucky state officials in the matter. Governor Morrow met a delegation of business men from Newport, but he gave no decision. One night word was received that four companies of state troops were on their way to Newport, under command of Colonel H. H. Denhardt, a newspaper publisher from Bowling Green, Kentucky. They came into town quietly. The soldiers were called "feather beds" in Newport. They were, in most instances, young fellows, from the smaller Kentucky cities, and a good many were about half as big as some of the steel workers. The troops attempted only to check lawlessness, which was rapidly getting beyond all bounds. No harsh means were employed. There was, of course, much resentment against the presence of the troops. Steel workers spit tobacco juice in the soldiers' faces, but there was no retaliation with weapons. And this condition prevailed until about the end of 1921.

Stills and high-power rifles captured in raids.

At that time, Governor Morrow hoped that the new administration which was coming in, the new circuit judge who was going to take the bench, and the new sheriff who was to take office, would handle the situation. Newport has a commission form of government, and a new set of commissioners would come into office. One of these commissioners had been elected by the Good Citizenship League, an organization whose nature is explained by its name. Eventually the sheriff and one commissioner sent a letter to Governor Morrow asking him to remove the troops. The local American Legion post also requested that the troops be removed. This request was afterward the subject of considerable stir among the Kentucky American Legion posts. Petitions from citizens requesting the governor to remove the troops also were sent. So the troops were ordered from the city.

The sheriff swore in about 30 deputies to preserve order. The troops were barely aboard their cars, however, when disorder again broke loose. Up to that time the matter had been purely a labor fight. This time the disorderly element took charge, and held the civil authorities in such contempt that the rankest sort of indecent violence followed. Deputies were among the men who were firing at the mills. Policemen were also firing at the mills. Governor Morrow went to Newport and to Cincinnati to attempt to settle the difficulties. His efforts had no effect and, matters passing endurance, return of the troops was asked. At that time Governor Morrow openly charged the public officials of Newport with neglect of duty. In an official proclamation he said: "Law, order and security do not exist in Newport; lawlessness—brazen, open and defiant—has been supreme. Your peace officers advise me they are powerless. I am sending the National Guard troops of the commonwealth of Kentucky to put an end to this condition. Violence and terror have existed. They must cease to exist. Newport has been disgraced and dishonored. The cause of this disgrace and dishonor must cease."

This time the first arrival was a tank corps from Covington, just across the Licking River. Next day, cavalry, infantry and machine gun companies from the central part of Kentucky arrived. They were under command of Colonel Denhardt, and none of them were "feather beds." These troops were armed with black jacks and magazine pistols, as well as with rifles, and were fit for any kind of fighting which the situation might demand. Immediately after their arrival they started in to clean up Newport. The first thing they did was to "rough" the lawbreakers. There was an open battle between the troops and the element that for months had menaced the lives of persons living near the mills. There also was an impression parade. The troops were sent out to disperse a mob of about 1,000

persons at Ninth and Brighton streets. When the soldiers arrived the mob dispersed, and congregated in smaller groups in various sections of the city. Colonel Denhardt decided to march through the city, disperse these groups and show the strength of his organization. Cavalry, infantry and tanks took part in the parade. The cavalrymen had their pistols in plain sight and the rifles of the infantrymen were loaded. Scouts and military police, swinging clubs, inspected the yards on each side of the street as the troops passed to guard against the fire of snipers.

This display of force, however, had no apparent effect on the disturbing element. Men gathered in saloons and pool rooms, and as soon as the troops passed they resumed their violence. To get at the source of the disturbances, soldiers cleaned out four saloons in the strike zone. Soldiers forced the saloon owners to close their windows and bar their doors. Other saloons and pool rooms in the strike zone were restricted in their operations and their proprietors warned. At that time the military authorities declared they discovered these places to be "blind tigers," that they were seats of vice and lawlessness, and that the schemes of the disturbers were hatched there and carried out by gunmen. Murderers, thieves and criminals of the worst order were mingled with the general disturbing element in Newport, it was stated. Governor Morrow asked that the best Federal prohibition enforcement officers be sent to Newport.

Came the first clean-up. It was through what was known as "Little Mingo," or the "Wicked Strip," extending from Third street to Eleventh street toward the south, and from Brighton street west to Licking River. In that section were questionable houses, gambling dives, low saloons, bootlegging joints and the roughest of the rough, and the rawest of the raw. The troops were accompanied by the United States prohibition enforcement officials. Liquor was confiscated, and many arrests were made, approximately 100 men were arrested or cited to court, charged with violations of the liquor laws. The equivalent of 80,000 bottles of beer, and 1,000 quarts of whisky was destroyed or confiscated at that time. Several officials of Newport and Campbell County were found in saloons when the raids were made. One of them was a police court judge. This was the first entry of the United States into the Newport situation. From that time Federal and state officers have been on the job with the state troops. Immense quantities of gambling paraphernalia have been captured and destroyed. Since then the bootleggers and all other law violators have been on the move. Violations of the prohibition law are but one of the troubles in Newport. Gunmen, thugs and gamblers felt that they could go as far as they liked in Newport without any hindrance by the local officials. Saloons were plentiful, and a majority of them were of low order. If there were any restrictions on these saloons nobody seemed to know about them. After prohibition went into effect these saloons kept right on, selling whisky and beer almost as openly as in pre-Volstead days. The action of the military was, therefore, a shock to them. The mayor, chief of police, county attorney, county detective, and two county patrolmen were arrested on warrants sworn to by a United States prohibition enforcement officer, who charged them with violating the Federal prohibition laws.

When one of the Newport clergymen organized a Good Citizenship League last autumn, another peculiarity of the city came to the front—the business men of the city did not join with the preachers to clean up these conditions for fear of losing business! There was reason for this fear, because boycotts had been executed there.

The preachers contended all along that the crux of the situation is in the commonwealth attorney, who has power to nullify the work of the grand jury by failure to call up indictments. A fight was made on the present commonwealth attorney at the last election, but he won by 2,700 votes. In Newport among all the elements which make for public good the only fighting force that has been found is the ministers and their congregations. But, generally speaking, Newport is so stewed in infamy that she does not understand that this is an effort to right the city morally, and that the entrance of preachers into the battle is necessary because there is no one else to lead the fight.

As a result of the visits of Governor Morrow a secret committee, comprising 30 or 40 citizens, meets in Cincinnati.

Newport is a place where the civic fabric long ago became rotten, because the city officials have been able to submerge the better element. This is a peculiar condition within a democracy, and one that is hard to explain.

It is more insidious than Bolshevism. One reason for this condition is the absence of newspapers. There is no press to direct public opinion and to expose official delinquency.

Another peculiar condition in Newport is that the better class of women will not enter the fight to clean up the city. The consequence is that the woman angle of the situation there is worked from the viewpoint of other elements. One of the most active agents of lawlessness is a woman.

The original trouble in Newport has been entirely submerged. It began as a labor fight. Now it is a fight for decency. Commercialized vice is fighting to the death. Every form of "lip campaign" is being used. As an instance, "lip campaigners" have told the public that this is a movement on the part of "preacher politicians," and that the congregations were not with them.

Another form of "lip campaign" brings all sorts of charges against the conduct of the soldiers. So that in Newport and in the surrounding cities and towns one can hear any sort of a story about the forces attempting to clean up a town that has been morally rotten for more than half a century.

Finally, not only Governor Morrow and the better element of Newport are concerned, but all Southern Ohio is vitally interested. Newport is a moral sink. The tale of its infamy, as cataloged in the moral ruin of individuals, can never be told. The list would be too long for belief and the details too sordid for contemplation.

Mounted troops patrol the streets of Newport, Kentucky.

Strikers and strike sympathizers at Ninth and Brighton streets, Newport, Kentucky. It was from this saloon that shots were fired at troops and into the Newport Rolling Mill. It was the first saloon raided and closed by the troops. Men refusing to vacate were pitched through the windows by troopers.

COLONEL H. H. DENHARDT,
Who is cleaning up Newport, Kentucky.

The Ghost of John Burns

By ALEXANDER IRVINE

London—(By mail).

TWENTY years ago John Burns was the most powerful Labor leader in England. Trafalgar Square was his pulpit, his parish was the docks and wharves of the Port of London and his parishioners were the dockers, freight handlers and longshoremen.

Burns, as a personality, emerged in a great strike and was eclipsed in a great war. Few men in English public life have had such a meteoric rise. Fewer still have been the men who have fallen from the seats of the mighty with such suddenness. The climb from $10 a week to $25,000 a year as a Cabinet minister is something of an achievement. What was the secret of his success? A knowledge of men, a dominating personality, rugged speech, an ability to go across lots to the facts and a definite program in social reform.

Success did not swell his head—it was swollen when he began. He was the center of the world in which he moved. The regimentation of labor forces meant nothing to him. He never worked in harness. He had no colleagues. He was a radical and a firebrand, smashing and slashing right and left. He was considered a social menace when Battersea sent him to Parliament. When he entered the Cabinet he became more of a menace—not because he was likely to make a misuse of power, but because the social spirit of Britain had by that time marched past him and left him a mere bugler of the social rear guard.

He Does All the Talking

HIS face is rough but kindly. His hair is white now and his gait somewhat slowed down, but he is still agile, alert, and quick of movement. His speech is the speech of a docker, not always correct, but direct and pointed. He was a splendid debater, always sure of his facts and equally sure of the weak spots in the argument of an opponent.

Dressed in a reefer jacket with a bowler hat you could tell him a mile off—but you couldn't tell him much! I have talked many times with him and never yet completed a sentence! He talks incessantly—no man, be he Prime Minister or costermonger, ever got a word in edgewise. When Campbell Bannerman was about to tell him that he had appointed him to the Board of Trade, it is said that Burns broke the Prime Minister's sentence in halves by saying—"it's the most popular appointment you could have possibly made, sir!"

Until the war came, John Burns was England's champion optimist. His life was one long ebullient joy. Proud as a peacock! Proud of his record, proud of having been in jail, proud of Battersea, proud of Britain! To him the earth has no place like Britain, Britain has no place like Battersea, and in both there is no man like John Burns! He tells you these things and doesn't wait for a reply. To him there is no reply. Every man, woman and child to whom he talks is an audience! He is the chairman, the speaker, the doorkeeper, usher and bell-ringer. He moves the vote of thanks, seconds it, replies to it and tells you when to go!

Overcoats, gloves, spats, monocles and such like are to him signs of an effete effeminacy. But no man ever so dearly loved the frills and furbelows and fiddle-faddles of rank. When he became "The Right Honorable John" he gloried in his Windsor uniform. He loved to be photographed in court costume—knee breeches, buckles and sword.

Gold Lace Brought Him Joy

NO ONE ever accused Burns of hypocrisy or dishonesty. Both enemies and friends saw inconsistence. He didn't. He was heckled and twitted a great deal about his gold lace and knee breeches but his chief concern was not the fuss about them but their fitness. He wallowed in joy over them. The look on his face said: "I am still the man of Tower Hill and Trafalgar Square, but I have bridged the gulf that yawned between them and Buckingham Palace!" And there was truth in that. The democrat became a swashbuckler but by the sheer force of a dominating personality he had compelled the British public to look his way.

"Do you see those volumes?" Burns said to me in his library one day. "That's my record in municipal statesmanship!" There were about twenty volumes and they contained records of his work for London. He could probably claim to be the father of "town planning." His ideals have gone up in brick and stone. Burns has been a big asset in the life of his city. He might have been a much bigger asset. The Germans were his total undoing. On the declaration of war he shed his Cabinet habiliments and sat in the House of Commons as silent as the grave for two years.

Four years after his retirement from office and just before his exit from Parliament, John Burns made his peace with the Labor fold. His return was an equivalent of extreme unction. During the war he haunted the lobbies and libraries at Westminster, a grizzly old ghost—a cynical and garrulous ghost—the mere shadow of the man whose voice thundered over Tower Hill and Hyde Park. Other men, conscientious objectors of the Labor movement, went into the shadow during the war. They may return—Burns was totally eclipsed. He marched into oblivion and banged the door after him. For him there is no return—no comeback.

Woman Leads People's Battle in South Dakota

Indorsement of Miss Alice Lorraine Daly Heartens Farmers for New Fight; Nonpartisan League's Nominee for Governor Likened to Modern Joan of Arc

NONPARTISAN LEAGUE voters in South Dakota regard the unopposed indorsement of Miss Alice Lorraine Daly, in the recent proposal meeting at Pierre, as the party's candidate for governor of the state as a happy augury. The indorsement, under the Richards primary law, is equivalent to a nomination, and enthusiastic Nonpartisan Leaguers are already proclaiming that her nomination is equivalent to an election. Undaunted by the defeat of last autumn, when the league went down after a hard fight in which it was charged that the banking interests had massed their powers against them, the leaguers now promise to prove that the party is a very lively corpse in the next election campaign.

There is very general insistence on the deathlessness of the spirit of their cause. This belief takes practical encouragement from the fact that last November's victory is proving an empty one for their opponents, as the new anti-league administration is powerless to abolish the Bank of South Dakota and other farmers' institutions that are still buttressed by the state constitution—the proposed anti-nonpartisan amendments having been defeated at the polls in the same election that carried their proponents into office. Moreover, the success of the Bank of South Dakota in placing the state loan, despite every effort of "Wall Street" to boycott and discredit it, and comparisons of the help the "farmers' own bank" has been able to extend to the agricultural industry in South Dakota with the acute distress of the farmers in the neighboring states of Oklahoma and Texas dependent on local banks dominated by the Federal Reserve system, may do much to strengthen and establish the wavering lines.

Beyond these practical considerations, rather loosely regarded as constituting the strongest appeal to the hard-headed and horny-handed sons of the soil, it now seems possible that the coming campaign will take on the bright golden hue of romance. The Nonpartisan Leaguer would not be a Nonpartisan Leaguer if he were not very much of an idealist, and being an idealist means being a poet and a prophet in the very heart of him—or her. For that matter, who can rule romance out of blood and soil that is American with the Americanism of John Brown, of Osawattomie; of Abraham Lincoln?

Romance in the radiancy of unconquerable Youth, its vision and courage, its daring and faith, its high loyalty to the cause it espouses and makes its own—are all symbolized in the woman the leaguers have chosen as their standard bearer. Admirers are already mentioning her as "The Joan of Arc of South Dakota." Voicing much the same faith in the God of Justice and Freedom, the Father of the Poor and the Friend of the Oppressed that inspired Joan of old to leave her sheep in Domrémy and go forth to battle for king and country against an enslaving invader, Alice Lorraine Daly would don the shining armor of ideas and ideals. Her sword and shield would be character and capacity for leadership in the politico-economic field. Her own contagious convictions and enthusiasms would command the trust of her followers and she would storm the citadels of the foe with the invincible spiritual weapons ever mighty to the pulling down of strongholds.

Still in her early thirties, an outdoor woman of robust form and a nature lover, her classic features crowned by a mass of shining gold hair and lighted by sparkling blue eyes capable of passing from the expression of deepest seriousness and earnestness to twinkling gaiety and humor, Miss Daly distinctly honors the comparison with her great French prototype in personal appearance.

The nomination came to Miss Daly herself as a complete surprise and there was an element of genuine spontaneity in the unanimous decision of the convention at Pierre that might well encourage any candidate. But there was no medieval miracle about it. For seven years she has been a leader in South Dakota politics, especially on the feminist side. And she came to the state and to her work there with a very thorough equipment for a successful career. Born on a little island in the Mississippi River, near St. Paul—"Gray Cloud Island" is the melodious name given to it by a famous Indian chief in memory of a beloved daughter of that name—she was educated in the St. Paul public schools, going from the John A. Johnson High School to the University of Minnesota where she distinguished herself by industry and scholarship, attested in the winning of the degrees of Bachelor of Arts and Master of Arts. Further to fit herself for a public career, she went to Boston and by intensive training and hard work completed in one year the three-year course of the Emerson College of Oratory, later going back and taking the postgraduate course. Some foretaste of the sweets and the power of popular leadership came to her while in Boston in her election to the presidency of the Students' Association, which included the whole student body of an institution to which Elbert Hubbard attributed his own platform success and which has been the training school of many American orators.

MISS ALICE LORRAINE DALY

Daly is a good Irish name, and both in features and voice Miss Daly suggests a blend of French with Irish blood. It may not be without significance that her first name means "consecrated to God" and that her middle name is that of the French province of Lorraine, in which the Maid of Domrémy was born—the province also of the more recent heroisms of Verdun and St. Mihiel, Chateau Thiérry and the several battles of the Meuse.

Miss Daly began her work in South Dakota, as head of the department of public speaking at the State Normal School at Madison, in which position she continued for five years, resigning two years ago to accept the nomination for state superintendent of public instruction by the Nonpartisan League and to take an active part in that campaign. In much demand as a speaker in both North and South Dakota, she has since June, 1920, traveled more than 20,000 miles and delivered more than 300 speeches. She enters this year's campaign in the pink of physical fitness and declares herself ready to put up the fight of her life for the supremacy of the people in the government of the state.

Ever since she arrived in South Dakota, Miss Daly has been intensely interested, first, in the suffrage movement, and later in the work of the League of Women Voters, and always in the Peace Movement. She is a member of the state board of the League of Women Voters and has been state chairman of the Committee on Women in Industry ever since the league was organized. Jane Addams picked her as state chairman of the Woman's Peace Party for South Dakota and she is still actively interested in the work of that organization, which is now known as the Woman's International League for Peace and Freedom. Indeed, Miss Daly is interested in every phase of the peace movement and has consecrated her life to the crusade against militarism and the effort to make the teachings of the Prince of Peace a reality in our national and international life.

When asked to tell something of her life story, Miss Daly responded readily:

"The experiences that have shaped my life have been the needs and sorrows of other people. Those incidents stand out like flaming torches against a midnight sky. Each has been a spiritual crisis in my life—the execution of Sir Roger Casement; the mobbing of a pacifist in his home town, which was also my town, after he had served his sentence in the penitentiary; the fact that I witnessed the farmers of a county excluded from a hall that they had engaged for a meeting because the local authorities had learned, after renting the hall, that the farmers intended to hold a Nonpartisan League meeting. These experiences brought home to me with terrific force the realization that I was teaching these farmers' sons and daughters, not living truth, but falsehood, when I taught them the first Amendment to the Constitution. The cry of undernourished children echoing through unkempt day coaches, as they lumbered slowly over South Dakota prairies; the knowledge that mothers, already too heavily burdened with care, responsibility and endless work, must go down into the shadow of the Valley of Death, alone, miles from any medical assistance, in order that our state, heedless of their needs, might be enriched by the coming of new life; the dearth of good homes among our workers; the lack of educational opportunities for our rural children; the insistent and unanswered appeal of our hungry-minded, hungry-hearted women on the farms—an appeal that always brought to my mind flashing memories of Bastien Le Page's painting, "The Noon Hour"; all these constitute the ray that has fallen before my eyes and to which ray I feel called upon to testify.

"My campaign will not be a campaign against anyone. It will be a campaign against conditions, against the weaknesses of our present, outworn, economic system, and for a more modern system of finance, credit, public control and ownership, a system that will lift from the masses of our people the burdens of mortgages, taxes and ever-recurring payments of interest that keep them in a state of servitude.

"I feel that the greatest need of our nation today is able, fearless, spiritual leadership in governmental affairs. We need men and women who see life sanely and see it whole, men and women who have plumbed the depths of human suffering and have been 'born again.' Such leaders will clarify our sense of values, will shatter to pieces the hungry materialism of our era, and will illuminate it with such a light as has never been seen on sea or land. This light will reaffirm in our minds the old truth that this era has travestied; that *not property rights but human rights* are the most precious concern of a wise people.

"We must cultivate in the rising generation an attitude—which those in control today seem never to have had, or have somehow lost by failure to cherish—a welcoming attitude toward new ideas. The enemies of progress are the enemies of human freedom. We must discourage them."

An Indian Chief's Version of Custer's Last Fight

Flying Hawk, a Survivor of "Massacre," Tells Story From His Standpoint; Statement Considered a Valuable Original Document for Future Historians

By M. J. McCREIGHT

THE writer of this article formed friendships with Flying Hawk, Iron Tail and other chiefs and he was adopted into the tribe and made a chief with the title Tchanta-Tanka, which may be translated "Great Heart." The historic Battle of the Little Big Horn was a frequent subject of conversation with Flying Hawk, and on one occasion the old chief was induced to make a statement on the subject, which Mr. McCreight took down. Here is the statement, only the solecisms of the Indian's broken English having been omitted.

OF THE hundreds of fights that marked the era of warfare between the whites and the aborigines in the course of our "Winning of the West," that which stands out most distinctly in the memory of men still living and in the more or less veracious chronicles that form the basis of thousands of tales of wild adventure is the Battle of the Little Big Horn on June 25, 1876. Particular pathos was given to this event (described by the whites as a "massacre" and by the Indians as a "battle") by the death of one of the most dashing and romantic of cavalry leaders, General George A. Custer, himself the hero of a hundred fights and idolized by the army and the frontiersmen of his time for his picturesque and charming personality, his valor and his soldierly qualities. In the galaxy that included General Nelson A. Miles, Phil Sheridan, Buffalo Bill and Pawnee Bill, Custer was a bright and shining star.

In connection with the celebration of the forty-fifth anniversary of the battle last June, when a monument in honor of General Custer was unveiled on its site, several narratives of surviving witnesses of the fight have appeared in the magazines and newspapers. It is hardly strange, in view of the fact that Custer and all his men—all the actual participants on the side of the American troops—were killed, that these narratives should be in many instances cloudy and conflicting. The writers saw the action from a safe distance and in the confusion and excitement of the occasion, it is scarcely to be expected that they could have noted the incidents of the battle with any degree of accuracy, to say nothing of the allowance to be made for the faults of memory in the lapse of 45 years. Most of these accounts, indeed, are made up from observation of circumstantial evidence after the battle was over. All of them are written by white men. Moreover, the fact that Indian fighting was not carried on with the nice regard for system, design and carefully plotted plan taught at West Point and practiced by the Civil War veterans of that day, makes it unreasonable to assume that these reports could possibly be in agreement or entitled to any high degree of authenticity.

For the first time, the actual story of the Battle of the Little Big Horn is now given to the public from the standpoint of the Indian. In regard to this particular fight as in regard to the major events of the century-long strife on the American frontier, American history is practically silent as to the Indian's side of the story. Some day the whole sanguinary tale will be told impartially. And when it is told, the reputation of the Indian will perhaps emerge, if not untarnished, at least a bit less black than it has been painted. It is the old story of the difference it makes whose ox is gored. Just now we are learning how much it matters whether the story of a war is told by victor or vanquished in regard to the greatest of all wars, a war that involved much of the world.

Custer, commanding the Seventh Cavalry, divided his forces to the north and south of the junction of the Big Horn with the Little Big Horn, and with five companies, containing 208 men, dashed at the center of the Sioux position, whose strength he had underestimated. He was pushed back, completely surrounded, and his command killed to a man. When two days later Captains Gibbon and Terry came upon the bloody scene and wired their report to Washington it is little wonder that the country was thrilled with the horror of the story.

It is to be noted that in the accepted historical records, the killing of Custer and his troops looms large even to this day while comparatively no mention is made of our violation of the Black Hills Treaty which led up to the Indian insurrection of which the Custer massacre was an incident. One must search carefully to find mention of the fact that Custer and his command killed more than 100 Indians in an engagement at Washita that preceded the Little Big Horn fight. Possibly this Washita incident is regarded by the Indians much as we have all along regarded the later fight—as a "butchery" and a "massacre."

For the sake of the sharp light of contrast, let me cite briefly the accepted historical version of the sanguinary struggle in which Custer was killed before coming to the version related to me by an Indian participant still surviving among the nation's wards on the Sioux reservation in North Dakota.

CHIEF FLYING HAWK, of the Sioux.

The Indian outbreak followed for the violated treaty that robbed them of their lands. In the Big Horn attack, Custer's plan was to converge upon the hostiles in three columns, Gibbon from the west, Crook from the south and Terry from the east. Terry's division included the famous Seventh Cavalry under Custer, 600 strong. In advancing from the south, Cook was hindered by repeated attacks and delayed; Terry moved up the Yellowstone as far as the Rosebud, where he made a fortified camp. Custer moved around to the south and up the Rosebud to drive the Indians down the Big Horn into fire of the larger force that was to march up stream; he sent Reno with seven companies across the Big Horn to descend it and attack from the west. Before he could do this, he was himself attacked and held on the defensive for 24 hours. Custer, with the remaining five companies, came upon the Sioux camp and without hesitation charged the Indians. The particulars of the fight can *never be clearly known*, for *every white* man engaged *was killed*. It was all over in 20 minutes. Curley, Custer's scout, wrapped himself in a Sioux blanket and alone escaped.

Our history continues: "Gibbon and Terry, ascending the Big Horn, came upon the bodies of Custer and his companions *two days after* the massacre. Custer had been shot in the left temple, and his was the *only* body that was *not* mutilated." It was found that the Seventh Cavalry lost 261 killed and 52 wounded, Terry having lost 53 killed, escaping the fate of Custer's force by retreat to the west bank.

Recently there appeared the story of a survivor who says: "I was in the thick of the fight on the Little Big Horn from start to finish, saw the first man fall by my side and lived through the two days' battle to help bury General Custer and his gallant men." Continuing, he describes the finding of the bodies: "The bodies of Custer and the men trapped with him were in an indiscriminate heap. The Indians had stripped every private in the ranks, every officer save one, Custer. They had scalped every man except the general. Custer's body had been lifted from the heap and laid to one side, a handkerchief spread over his face. A knife had been inserted deftly under the lower rib and the heart extracted. We found it set up on Custer's breast, a silent testimonial of the completed vengeance of the Sioux chief. Some time after the battle, when I talked to Rain-in-the-Face, he told me he had vowed to General Custer that he would some day cut out his heart, and that he left it on the battle field as his boast that he had carried out his threat."

Properly to understand this incident of the heart-cutting, we shall revert again to history and quote another line or two: "Chief Gall was leader in the massacre. Rain-in-the-Face was the Sioux chief who killed Dr. Hulzinger and Mr. Balliran in 1873 on the Rosebud. These men had fallen behind Custer and his command, and were found dead with no traces of their slayers. Some months later, Rain-in-the-Face told of the killing, in the hearing of Reynolds, one of Custer's scouts, who reported it to the general who arrested Rain-in-the-Face and locked him in the guardhouse, but he escaped." It was this arrest that inflamed Rain-in-the-Face and his friends, among whom the nearest and best loved is none other than the author of the statement hereinafter quoted—Chief Flying Hawk, who was with him throughout these campaigns, was present in the 1873 incident and during his arrest and confinement, and took a prominent part in the massacre under Rain-in-the-Face's leadership. But here again it is necessary to call up some history and try to understand the Indian's viewpoint and the cause and manner of the arrest.

The Sioux and Cheyenne country included the Black Hills, where gold was discovered in 1874; it was on their "reservation"; they had been driven out into this bleak and supposedly valueless land, just as they always had been, and herded together like so many wild animals, and, like animals, were supposedly fed and clothed by the government in this "reservation" set apart and sacredly proclaimed by solemn treaty to be theirs forever.

It was under these conditions and while facing starvation, that Rain-in-the-Face wandered from the reservation to hunt along with others. This, with the blame for killing Hulzinger and Balliran, furnished an excuse for his arrest and inhuman confinement. It was then that he made the threat that some day he would cut out the heart of General Custer. It is believed that failing to "convict" the chief in a court-martial proceeding, the general issued orders to his jailers to remain off duty while Rain-in-the-Face "escaped" from the guardhouse. He had not "murdered" Hulzinger and Balliran, for it was

Why American History?

THE city of New York, for the moment concerned regarding the kind of history it shall impose upon its school children, has committed the guardianship of American tradition to one David Hirshfield.

Mr. Hirshfield has been holding hearings. There have appeared the advocates of all kinds of history. There have been those who demand an American past, in which the valor of American arms, the stainlessness of American honor, and the demi-godlike stature of American statesmen appear in bold relief. Then there are those who insist they march behind the white banner of truth and who abhor the idea of remembering national heroes only in terms of the funeral eulogy and forgetting the fact that they ate with their knives. The stalwart advocates of truth have thus far brought into controversy the vital question as to whether the hair under George Washington's powdered wig was brown, or—horror of horrors—red. In addition, Mr. Hirshfield has before him the protagonists of the belief that the salient things are not taught in present history books. These latter rely chiefly on the fact that the books have no record of Washington's home brew recipe.

But the testimony of one witness would seem to indicate that the proponents of the investigation have missed the point. A lecturer who had talked in the schools on "The American Flag" testified that it was his custom to ask the pupils regarding famous figures in American history. In a typical school in the Bronx —the borough in which the alien ear is least often offended by the sound of the English language—he sought information regarding Paul Revere. Two pupils of the entire class had heard the name.

"Now," asked the lecturer, "is there anyone who can tell me about Lenin and Trotsky?"

Every hand went up.

Congressional Commissions

WHEN legislators are confronted by an opportunity to use plain horse sense in the solution of some simple problem, they get rattled. They are a little like the old-fashioned diplomats who are thrown into a panic by a bit of straight truth-telling and plain-dealing. Subtlety is suspected. Then they refer the bit of plain work to a committee and the committee holds "hearings" to which everybody who is supposed to know anything about the subject under consideration is summoned to contribute out of "expert" knowledge or out of vast funds of misinformation.

Having in this way tangled and twisted the plain matter out of all semblance to its original aspect, the members of the committee discuss the measure among themselves, damning it up hill and down dale until it is involved in a tortuous maze of contradictions. Sometimes, the committee at the last is content to wash its hands of responsibility by making majority and minority reports, one as incomprehensible as the other. Of late, the persistent legislative effort to make confusion worse confounded goes still further, and it is sought to escape the perniciously manufactured problem by creating a special commission to deal with the whole subject. So marked has become the recent trend to the creation of these commissions to do the things that members of Congress in either House are elected and paid to do, but dodge doing, that "government by commission" is likely to become as justly obnoxious as was "government by injunction" a few years ago.

In the vernacular of the Capitol, every such commission is a "plum tree." It means another suite of offices and clerks and stenographers and traveling and other expenses and salaries and salaries and salaries, that is to say, jobs and more jobs for political henchmen. Circumlocution and procrastination are of the very essence of the legalistic mind and its methods. Some day we may get tired of government by lawyers and send a few men of action to Congress—business men and "dirt farmers," for instance.

Stealing Candy From a Baby

MUCH attention has been concentrated lately on the tribe of grand larceny grafters whose specialty is working on the unholy "get-rich-quick" ambitions of people ignorant of the first principles of legitimate investment or speculation, and who are tempted to put their savings, much or little, into gambles in the guise of fake gold-mining or oil stocks. But the less spectacular activities of the petty larceny swindlers who use the advertising columns of daily, weekly and monthly publications, especially farm papers, to prey upon the poor seeking only a chance to earn money honestly, calls aloud for the attention of the Postmaster-General and of the American Advertising Association.

An Indiana reader writes us that the typical advertisement of these harpies is one that appeals, especially in these days of high prices, small incomes and business depression, to women on farms or in small towns, women who are anxious to help out the family expenses by "spare-time" labor. In many cases, this spare time is the scanty leisure left after a hard and long day's toil, washing and baking and mending and house cleaning. Knitting machines are offered by means of which, it is promised, many dollars may be earned easily. Or it may be guinea pigs or Belgian hares that are offered.

The victim is lured by promises that the advertiser will pay good prices for all the knitting done on the machines, or for all the increase in the guinea pigs or the Belgian hares that may be shipped. But, as our correspondent tells us, in most cases "the knitting machines won't knit and the guinea pigs won't guinea," being sterile stock. Publishers who lend their pages to these swindlers are nothing short of accomplices in crime.

Emmet's Epitaph

THE one hundred and forty-fourth anniversary of the birth of Robert Emmet was celebrated on March 6, last, and the occasion strikingly suggests the belated, but none the less happy, fulfillment of the condition to the realization of which he demanded that the writing of his epitaph should be deferred. Standing in the prisoner's dock in a Dublin court, convicted of high treason for his part in the Irish Rebellion of 1798, the brilliant and ardent young patriot was accorded opportunity for "explanation or apology" before sentence of death was passed upon him.

He neither explained nor apologized. Instead, with burning eloquence he at once vindicated his course and that of his associates in the heroic national effort—probably inspired by the successful revolutions in America and in France—and left on record an indictment of English misrule that shook the strongholds of tyranny throughout Europe.

In the century and a quarter that has elapsed since this dramatic incident, it is probable that Emmet's fearless example, and especially his last speech, have done much to keep alive the fires of national aspiration in Ireland. Today his heroism and his martyrdom bear fruit in the entrance of Ireland into the family of self-governing democracies. Emmet's last speech closed with this appeal:

"I have but one request to make on my departure from this world—it is the charity of its silence. Let no man write my epitaph; for, as no man who knows my motives dare now vindicate them, let not prejudice or ignorance asperse them . . . . Let my tomb remain uninscribed, until other times and other men can do justice to my character. When my country shall take her place among the nations of the earth, then, and not until then, let my epitaph be written."

The Secret of "Pep"

AS EVERY woman knows, the difference between ordinary mortals and supermen is just "pep." Poets and inventors are born such, but "pep" is the double distilled essence of art. As the advertisements of correspondence courses in salesmanship, etiquette, short-story writing, interior decoration, dramatic art and magazine illustration never tire of informing us, it is possible to take an ordinary mortal, or even a subnormal person utterly ignorant of Plato and the Pleiades, and transform him into a genius and a wonder capable of capturing a salary of anywhere from $10,000 to $100,000 just by injecting into his brains one or more short courses of "pep," at so much per course.

While the unfortunate lacking "pep" may be doomed to languish in poverty and oblivion, the peptonized person, so to speak, sweeps on from glory unto glory. Lesser beings bow and retire abashed before him. In a recent strikingly illustrated ad of one of these marvelous "systems" for the manufacture of Napoleons of finance with "magnetic personalities," the "testimony" is given of a man of shy and modest disposition who was astounded when a "pep" graduate whom he had admired and worshiped from afar told him to go after an important job. The testifier protested that such a job was away beyond him; that he had had no training or preparation for its tremendous responsibility. But his friend lightly laughed away these Philistine fears and leaning over whispered in his ear the secret—the great secret of "pep." With eagle glance and indomitable mien, the erstwhile shy one braced the boss, demanded and got the big job, and thereafter so impressed everyone with his greatness that now he owns a country place, a palatial steam yacht, a racing stable and a whole fleet of high-powered motor cars. Next thing we know he will have a seat in the Senate.

The page ad does not tell what it was that the friend whispered so discreetly. That revelation is reserved for the correspondence course of 10 lessons for $100—10 per cent discount for cash. But we feel that it would be a shame to bar any poor but honest young man from the attainment of this wonderful knowledge for lack of a measly $10 a month. As the American Winston Churchill tells us, the "pep" mind is the primitive mind. It corresponds to jazz. Like jazz, it is destructive of the rhythm of the creative mind. Shakespeare and Michelangelo lacked "pep." So did Lincoln and Tennyson and Longfellow and Edison and Graham Bell. Otherwise, they would not have worked and drudged for years to get their work right.

What Wellington might have achieved, if he had only been put through a course of "pep" or even had the benefit of intensive training in short-story writing! His "Up, Boys, and at 'Em!" was in line with our modern idea of "pep," but how medieval the notion that "He who would command must first learn to obey?" And there's Franklin with his old-fashioned saws about working. They labored under the delusion that to command success one must deserve it.

To sum the matter up in an axiom: "Men with 'pep' rush in where angels fear to tread." They waste no time in hard study or training or saving. Even "in the piping times of peace," they cast "modest stillness and humility" to the fourth remove and "let their action imitate the tiger's." They are very much in evidence. Not only do they blow their own horns and beat their own drums, but they bestride the narrow world like a Colossus. They advance upon our civilization like an army with banners. "Brashness" we used to call it with affectionate contempt and tender pity; "pep" we hail it now, and laud it with loud hosannas.

The Call of Alaska

ACCORDING to Bishop Rowe, of Alaska, mission work among the Indians and Eskimos offers the life that should appeal to young men. All that is manly about a young man, he says, is likely to be brought out by the climate and the work. Having lived there for 27 years, he knows, and the Philadelphia reporter who interviewed him says that the good bishop in his own person offers convincing testimony to the truth of his assertion in athletic figure, ruddy complexion, vigorous carriage and elastic step.

There are possibilities other than missionarying in Uncle Sam's great domain in the Northwest. Pulp and paper industries are being started up with encouraging prospects, rich gold, silver and copper mines are being worked and more are awaiting the prospector. There is plenty of good coal, and prospecting for oil points to rich possibilities. Furs yield large financial returns and there are extensive deposits of good coal. Legislative and bureaucratic restrictions, it seems, have discouraged the investment of capital and so retarded the economic development of the territory. But if the right sort of young men will go into the country and take hold with a will, they should soon be able to get rid of the barnacles and grafters.

Mr. Ford's Page

MODERN highwaymen, operating as salesmen of fraudulent stocks, appear to have had a rich harvest in this depressed country, and promoters of get-rich-quick schemes have had no occasion to complain of hard times. Scarcely a city of size has escaped, while many sequestered villages inhabited by retired farmers have been victimized; and the largest harvests of all have been reaped from the prosperous farming districts of the Middle West.

The conventional reaction is to feel righteous indignation against the stock sharks. Certainly they are a despicable tribe, wholly outside even that criminal class whose boldness and adventure sometimes compel admiration. The old highwayman took a risk; the real robber stakes his life and liberty; these thieves of old men's savings and widows' insurance moneys are not in that class at all.

But as the old highwayman operated by force, his victims could be commiserated because they were forced to succumb to force. Victims of these modern highwaymen, however, have not that consolation; they succumb of their own consent. They "sign on the dotted line" under the magnetic wizardry of the high-power salesman who outwits their caution, carries by assault their logical defenses, and leaves them to get back to mental normalcy with a dread foreboding that a mistake has been made.

Old people and widows are expressly exempted from the remarks that follow; their plight is too sad for criticism. But nothing is more mistaken than to let sympathy drive out our common sense in surveying this situation. The fact that it is national, that it has lately had an amazing sweep in this country, requires us to look it in the face, and prevent our emotions from diverting our judgment.

What has occurred? Simply stated, this has occurred: a large number of people wanted to make fortunes by doing nothing, and were disappointed.

What was behind that desire? This: a widespread idea that it is possible to get something for nothing, that it is possible to skim the cream off other men's produce and live on the proceeds.

In this country there has been systematically cultivated an idea that money-by-trick is more plentiful than money-by-labor. And the senseless display which some people have made of what little money they possess, is responsible for it. We have been living in a childish attitude with regard to money. The success of a few crooked exploiters of honest men's confidence has spread broadcast the idea that the old-fashioned method of getting money by hard work has been done away with. There is a false idea that people can escape the discipline of life and by some magic or sleight-of-hand enter at one bound into the conditions that are won only by work.

It is not merely the people whose little savings are swept away, but also men of capital, who share this delusion.

When this truth is uttered, there are always those who say: "Well, the sharpers get their money without working for it!"

That is another point: the money won by fraud does not benefit anyone. Investigation of the gangs who profit by the foolish trustfulness of people has shown that the money thus obtained is scattered to the winds. The sharpers are not financiers, they are not constructive speculators, they are mere high-livers who fling their money about until they, too, lose it.

Money, of course, is never lost. Money remains in existence and does its work somewhere. All that can be lost about money is the control of it. You can lose your control over the money that you have.

Now, two kinds of people lose control of their money: those who are not wise enough to guard it, and those who get it by cheating others. The victims of the sharpers were not wise enough to guard their money: the sharpers themselves are not wise enough to keep and use the money they wrongly gain.

These points are of interest in considering the widespread carnival of deception and disillusionment that has followed in the trail of the get-rich-quick agents.

It is almost impossible to discuss the situation as it deserves, because of the common tendency to slop over into sentimental consideration for the losers. Of course, the experience was not pleasant. The disillusionment was a jolt. The mental sufferings are severe. But we must never lose sight of the fact that the victims were a contributing factor in the calamity. They signed. What they bought was "talk." They gave more thought to the persuasiveness of gay promises than they did to the solid security of their own interests. The victims, except in certain pathetic cases of helplessness, cannot be entirely absolved from blame. Had they said "no"; had they looked at the property they were asked to invest in; had they even read the instrument they signed—had they done anything whatever instead of giving in to sheer mental laziness, the damage could have been prevented.

That, perhaps, is the principal reason for most of the trouble—mental laziness. The next greatest contributing cause may be lack of business knowledge. Business knowledge is only common sense. And then, the third contributing cause is greed of something for nothing.

It would seem that common sense would warn people that there is never a chance of getting something for nothing. All the apparently miraculous successes of our day were built up bit by bit through obscure years, the main capital being hard work. People don't see that part of a business. All they see is the huge success after it has emerged above the shoulders of the times. But beneath that structure, buried in its foundations, are long years of plain hard work, plentifully mingled with discouragement and threats of imminent disaster.

There are as many chances now as there ever were, if people will begin at the bottom. But people don't want to do that. They are in too big a hurry to make money. They desire to attach themselves to something that is already making money. And yet all the successful businesses of today grew up, not because they were attached to previous successful businesses, but because they were built from the ground up by work.

The impulse to invest is right and it is a thousand criticisms upon our civilization that a man cannot invest where he works, so that he may not only have an additional income, but that his work may take on two-fold interest, that of employe and that of profit-sharer. If there were more opportunities for solid industrial investment in businesses which men are acquainted with, there would be far less of appeal in the false bonanza schemes that are exploited.

In the wide social sense, the present riot of stock losses is a good thing: it will clean up an unwholesome speculative fever. Even in the individual sense it will not be without benefit: thousands of young men and women have gained that most valuable experience—the experience they pay for!

If we were not so gullible a people there would be no one wasting time trying to get rid of worthless stocks. But every generation apparently must be taught the same lesson. It is not that the stock sharpers are wicked, it is that in money affairs our people are "easy." If they cannot be made less "easy" by warning, it may be they can be made so by experience. After all that is why we are in the world—to get experience.

WHEN people are "stung" in false investment schemes, there are three causes: greed of something for nothing; sheer inability to know their own mind; or infantile trustfulness. Two classes of people lose money: those who are too weak to guard what they have; those who win money by trick. They both lose in the end. The cause of the trouble is a lack of knowledge of the law that true gains must be earned, and true increase must also be earned. Money cannot work for you. Only other men can work for you. What right have you, save service to the world, to think that other men's labor should contribute to your gains? That is the moral question of investment that would prevent many a loss.

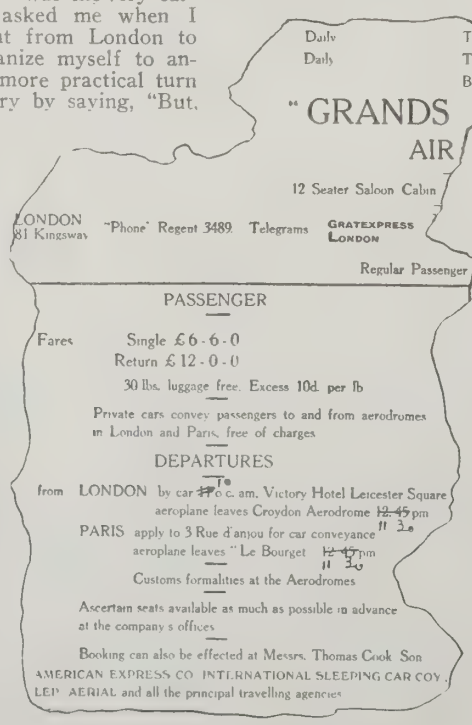
Halving Travel Time Between Great Capitals

By ROBERT J. THOMPSON



THEY had watched the passenger airplanes all summer as these great machines passed over the stretches of Normandy lying between Boulogne and Paris, in their flight from London to the French capital—great winged things that seemed to their infant minds as of the upper spheres of the earth, as indeed they were, for when the London-Paris Express airplanes reach the coast of France from the English side, they are often enough seen only through the fleecy clouds, and the roar of their motors is like distant falling water. They cross the channel at an altitude of 6,000 to 8,000 feet, and, at that height, they look like swallows, when one lies on his back and gazes into the heavens on a hazy summer afternoon.

"Did you see the angels, papa?" was the very earnest question my boy of five asked me when I reached him after my first flight from London to Paris. And before I could organize myself to answer, my daughter of six, of a more practical turn of mind, supplemented his inquiry by saying, "But, papa, I am sure you must have seen Santa Claus up there in the clouds."

What charming and withal natural questions. Indeed, who would not be a child again?

The shortest old-time route across the English Channel, that terrible slip of deep sea water between England and the continent, is 28 miles—the Calais-Dover line. There is a tradition that the crossing is made in one hour, but as it is the roughest bit of sea on the face of the earth, there would be no difficulty in obtaining sworn and overwhelming testimony that the voyage takes, sometimes at least, a thousand years. There is more sea sickness to the square foot on the English Channel, or Straits of Dover, between Calais and the English coast, than anywhere else on the watered portion of the globe. The airplanes cover this part of the London-Paris traject in just 20 minutes, as you time the flight far above the troubled waters, and the sea, seen from your viewpoint of 2,000 meters up (6,000 feet) strikes you as a wide sluggish river lying between two flat, sandy shores.

I remember crossing from Dover to Calais some 10 years ago. When we put out from Dover the sea was calm and the weather was bright and sunny. During the last half hour of our trip, however, our 1,800-ton boat, speaking metaphorically, which leaves something to your imagination, actually turned somersaults, and did a jazz that put every passenger on the boat, myself included, on his back in 10 minutes. All dignity and self-respect is gone here. The stolid Britisher, the man from Cheltenham and the Puritan-faced English governess suddenly sit up and take notice and become intensely human. What happens is simply appalling—beyond description. If you were to give 500 children a dose of nicotine poisoning, you might get something like it, minus the slide and the stagger, the leap and the halt, and the dive, and so on. On the painful occasion referred to, I remarked to some English friends, when disembarking at Calais, that it was a shame a civilized people like the English had stood for this business for 2,000 years, and that I was sure had the Germans been on the channel coast, they would have had a tunnel to England, in less time than it took America to build the Panama Canal. That was when the English used to regard the Kaiser as their most favored cousin.

Time-table of a London-Paris air line.

Well, probably there never will be any channel tunnel. But here we are, the problem solved by the airplane. You scarcely get away from the great government aerodrome at Croydon, just outside London, before you are making a vast side-dip volplane to the landing place at Le Bourget, likewise, just outside of Paris.

I crossed in two hours and ten minutes the other day in a French line machine, and, previously, on an English machine, in two hours and a half. The difference in time is a matter of favorable wind, as a rule. But the course has been made, I am told, in one hour and fifty-two minutes. That is at the rate of 125 miles an hour, or better.

There are now four established air lines between London and Paris, two English and two French. They are rapidly approaching real commercial enterprises; concerns offering actual profits to the stockholders. There is sharp competition between the French and English companies for this service, with the French in the lead at present, as far as the number of passengers carried, and general good will are concerned.

My crossing on the French machine was more agreeable and satisfactory in various ways than on the English line.

The airplanes now in use, and those in operation during the past season, are each equipped to carry 10 passengers and nearly one ton of freight, with two pilots, or one pilot and a mechanic. The English lines run to the former; the French to the latter. It is my impression that to have an expert mechanic aboard, whose job seems to be to watch the motors and the functioning of the various parts of the airplane, gave confidence to the passengers, and greater freedom to the pilot, who is, in fact, the chauffeur of these air cars. And while he has no trees, nor lamp posts, nor dogs, nor other cars to look out for, he appears to be busy enough with the complicated control of his machine and its cargo of human freight.

The confidence of the present passengers, and the incalculable future airplane clientele, is still the great consideration for this rapidly growing new industry.

Of the traffic between London and Paris, since the service began in 1919, I am told that Americans comprised the greatest percentage; in fact, of a total of 25,000 passengers carried by the several lines engaged in the business, approximately 20,000 have been Americans, who paid for the trip from $25 to as high as $100 (the original price) each for the flight from London to Paris, or vice versa. The charge today is £6. 6/-, normal exchange of $30, but working out at the prevailing rate at about $25. And it is not at all improbable that this will be reduced somewhat during the coming season. Great expectations are now in evidence and preparations accordingly are being made for the summer of 1922.

The reduction in the price of the London-Paris flying ticket was brought about by the establishment of the French Government airplane subvention scheme. The companies had been carrying passengers at about $32 each, and were nearly on a self-supporting basis, when the French authorities voted a large sum for subsidies, and the fare was reduced to 300 francs. The equivalent of this sum in American dollars has been running between $20 and $25 the past season. It operated to put the English companies out of business for a short time; anyway, until the British Government met the ante and made it possible for them to stay in the business.

This present low figure compares favorably with the first-class fares, with attendant expenses of lunch, taxicabs, tips, and so on, on the rail and boat lines between the two great capitals. But for every passenger and every ounce of freight carried, the two governments come along and help their respective companies out handsomely, this assistance amounting to nearly 50 per cent of the fares. Where you pay £6. 6/- for your ticket, the subsidy is three pounds extra, con-

tributed by the government; not only to develop the industry, but, incidentally, and more to the point, to prevent one from surpassing the other in the number of planes constructed, and pilots trained and kept in training against future requirements in a military way.

London and Paris represent a combined population of some 10,000,000 and, in figuring out the attraction of the trip, especially to Americans, it is my conviction that it lies more in the varying aspect of the flying course, than in what we might call the thrill of the flight alone. To view London from the clouds, to see a wonderful 90-mile panorama of Surrey, with its fields, roads, towns and cities; to drive across the historic channel, a 30-mile arm of the Atlantic, to skirt above the wide sandy places of France, and then soar over the fertile farms and forests and legendary places of Normandy, until finally one takes a gigantic swoop to the aerodrome on the edge of Paris, the Beautiful. That's the thing. It is a bit different than a trip from Boston to New York or from New York to Washington. The distances are the same. It is the history of the places! It is England! The terrible channel, France, Paris! These are certainly the chief reasons for the extraordinary American patronage of the flying trips from London to Paris.

Seasick? (Perhaps I should say airsick, as the English are rather punctilious on designation by words.) Sometimes; rarely, however, I should say, on the whole. Of the 10 passengers on one of my recent trips, one man became sick. It seemed unaccountable to me, as there was no more occasion for it than one would experience in an unexpected quick dropping of an elevator car two or three floors, with the usual sudden balancing stop. This might happen now and then, as one ran into an air vacuum or pocket, as they are called, in his rapid flight.

Air, though we walk and run through it, wave our arms and baseball bats and golf clubs against it, without conscious resistance, is a pretty solid thing after all. We are now floating some three, to five and even ten, tons; say up to 20,000 pounds of solid weight on the breast of this intangible combination we call air. It is a marvelous thing to be loaded into a fairly solid coupé, carrying, say 2,000 pounds of human freight, with clothing, shoes, hats and pocket knives and all that; and an added 2,000 pounds of merchandise, with several hundred pounds of baggage, and another 2,000 pounds of motor, oil, benzine, and so on, and perhaps still another 2,000 pounds, in some cases much more, of simple airplane structure, and then leap from the ground with this great load and sail steadily into the clouds.

This is the great thrill of the twentieth century. It, plus the attractions of the flying course, is the thing that catches the American tourist coming to Europe. Nor is there much fuss made about the matter either. Booking offices, that is to say, ticket agents for the several lines, are all over the place, as we say in England, and one engages his reservation, pays his six guineas, and meets an automobile at some hotel in the center of the city—London or Paris, as the case may be. This car carries you, we will say, from London to the London aerodrome out at Croydon, a half hour's drive. Here you have your baggage weighed (you are given 30 pounds free and charged 10d, say 16 cents, a pound for anything above this figure), then you are checked up as to passport and customs liability, and out you go into the flying field, where your machine stands awaiting its load, as quietly as a stork on one foot watching for frogs.

You mount a sort of Pullman upper-berth ladder, enter and take your seat (armchair of rattan and facing forward along the windows). The departures are punctual to the minute, forced on the companies by the conditions of the government subsidies, which I will explain in a subsequent article, and which are very interesting, not to say illuminating, in their military and commercial aspects. The rivalry between France and England in this field, though in its infancy only, makes the naval construction races between the several maritime nations of the past decade appear like the deliberations of the United States Senate on an afternoon in August.

LORD MONTAGU OF BEAULIEU

One-time head of British air forces, and promoter of commercial aviation for Great Britain.

However, the pilot is in his seat. He has his padded helmet on his head. We are all set. But about that helmet; one speculates as to what that is for—on his first flight—the thought, and a natural one, it seems to me, being that it is a safeguard against the crushing of the skull in case of—well, we banish the thought, and try to forget it; and learn quite casually afterward that it is simply a protection against that terrific air, which carries our 10,000 pounds so easily on its cushioning breast.

Six years ago, when flying was in its experimental stages, but being forced into utilitarian action, I had the privilege of passing on a proffered seat in a German war plane to John McCutcheon, who was diverting himself from his cartoon work by a bit of war corresponding on the German front in Northern France. They put a helmet on him and finally a German officer's jacket, explaining as they did so that if they were brought down by the enemy, the uniform would save him from being shot on the spot as a spy. He would simply be taken as a prisoner of war. But McCutcheon was game all right, and barring two or three unnecessary swallows, never turned a hair. They did not explain the helmet, and McCutcheon, true to his calling, took the risk of being captured as a spy or brought down by a French or English flyer.

Once more, we are off. The pilot has touched a button or two here and there, given a twist to a little crank, waved goodby to friends, and the great propellers are beginning to bore into the air ahead of us.

We move slowly down the aerodrome field—three or four minutes—and think: "This is not so much, we'll have to have more movement than this to get off the earth." Then the machine turns gradually to its proper course—to face the wind. Another quick turn of that little crank, and like a quail frightened from its hiding place, we dart across the field, and in a few seconds we leave the ground, unconscious of the transition moment from *terra firma* to the new, great and illimitable medium of transport, *The Air*.

Up, up, we fly, away from smoky, dirty, mighty London. Off to the shining places of the south—to the sea, and to France. In five minutes we are 10 miles away. Oh! What the —? And before you have time to reach for some impossible sustaining support, the 50-foot air-pocket drop has been stopped and the steady upward forward drive of the machine continues. One seems as though suspended in the center and on the rim level of a vast bowl, the distant horizon its circumference, and the earth below, its bottom. Thirty minutes from London you reach the sea, up 6,000 feet, or higher than Mount Washington. In 20 minutes we have crossed the channel. If one has good luck there will be clouds over this stretch of the course, and you will fly above them. And what a sight; what a panorama. They are not clouds at all, but stupendous, shining, wonderful mountains, great silvery valleys, bold and sharply marked crags and peaks, all glistening white and gray and green, and as fixed and permanent and solid, it appears, as the towering and everlasting snow-dressed massives of the Jungfrau or of Mount Blanc. No De Quincey, nor Poe, nor De Maupassant, in wildest hasheesh dream ever saw, and brought to light from the depths of his subliminal consciousness, more gorgeous, giantesque and wondrous vision than the cloud mountains one may ride above—if one has luck—in crossing the Manche by air from England to France.

No trouble to see the angels there, nor Santa Claus either, for that matter, with a little imagination of the happy days of childhood left to you. So I said to my little boy and girl, that I had, indeed, passed through the country of the angels and of Santa Claus, though unfortunately they were not about at the moment; that, anyway, we did not dare stop, and we were traveling so fast that had they been at home we probably could not have seen them.

An hour and twenty minutes from the coast at Boulogne and we are at the great French government-owned aerodrome Le Bourget. Here the passport and customs control again, and an automobile run into the center of the city, and the thing is done. I might interject here that so favored are the airplane passengers, by both the English and French authorities, I am sure one could pass into either country without passport.

Counting the motor car sections of the journey, we have given the trip four to four and a half hours' time. And it really costs less than a first-class boat and rail trip, and is made in less than half the time.

aux Sceptiques

"To the Skeptics"

French commercial aviation poster, to develop public confidence in air travel. Quoting the famous scientist, Prudhomme, in 1842, as one who did not believe in the railroads.

Disease Germs in the Healthy

By GEORGE HENRY HEALD, M. D.

ONCE it was supposed that all one had to do to cause an attack of a certain disease—say influenza—was to bring a person and the influenza germs together; that is, to expose the person to the influenza germs. According to this idea, the germ is confined to those who have the disease, and those who are coming down with it. And as a consequence, if we can quarantine the diseased ones effectively, we ought eventually to get rid of the disease. But such a procedure has never given us freedom from any of the infectious diseases. Possibly it was this fact that led in part to the notion that disease germs are often transmitted by means of clothing, bedding, carpets, toys, and a lot of other lifeless objects. But more recent research has demonstrated that the life of disease germs outside of the body is ordinarily very short.

Moreover, it has been shown conclusively that the infectiveness of patients often lasts long after recovery. That is, after the patient is again well, and back at his usual pursuits, he still carries the disease germs, and is just as capable of infecting others as he was during his illness—more capable, in fact, for now he mixes more with the people. Moreover, of those who are exposed to the germ, some do not contract the disease, and yet the germs grow in their bodies, or body cavities, just the same as they do in those who are made ill, and are given off to infect others in just the same way as if from the sick. The existence of these convalescent or immune "carriers" serves to explain why there are many cases of infection of persons who have "never been exposed to the disease." They have been exposed, without knowing it, to carriers, in the store, in the street car, or almost anywhere.

When an epidemic subsides, it acts something like a forest fire, which may die down on a cold night, and burst out afresh when the temperature of the air rises in the morning; and if a wind springs up. So in an epidemic, the most susceptible of the community may have all taken the disease, and possibly some influence has made the germs temporarily less harmful, and so apparently the epidemic dies out. Still there are numerous carriers in whom the germs continue to grow; and like the smouldering fire ready to be fanned into a flame and perhaps into a terrific fire, these germs are but waiting a favorable opportunity to renew the epidemic, in, perhaps, a more severe form. Some influences may so increase the virulence of the germs that some who before were not susceptible may now succumb. Perhaps some who were immune carriers now take the disease in a severe form. In this way we have a periodical ebb and flow of epidemic disease.

Some of the foregoing is inference, rather than demonstrated fact. But it is known positively that there are healthy carriers of the germs of diphtheria, typhoid fever, pneumonia, meningitis, and other infectious diseases. And it is also known that a disease germ may increase and decrease in infectiousness.

Knowing that we may meet disease carriers at every turn, and handle the articles which they have handled, we should learn the lesson that the prevention of infection is very largely a matter of cleanliness, that is, keeping filth, even of the microscopic kind, out of the mouth.

Marooned on a Gold Reef—The Fate of the U.S.

Money Brokers Hold World to Outworn Gold Basis; Goldless Europe Busy; Gilded America Idle; the Crime of Foreign Exchange

DURING the war and immediately following the armistice the ancient law of supply and demand was perennially manifest, despite the more or less artificial agreements between certain governments to suspend that law. As a result, nearly all business that was done was voluminous and swift enough, but gold became to all intents and purposes unnecessary and useless, so much so that today those nations face economic prostration on a ratio of their gold reserve.

A group of governments really demonstrated, albeit involuntarily, that gold is the one commodity that has violated and is continually violating the law of supply and demand. Gold is acting, as an international medium of value, in contravention to the very principle upon which it is supposed to be based. As a result of this conflict gold is not any longer a commercial lubricant but a brake which has virtually locked the wheels of international business.

The nearest that our government and banking interests have come to confessing this truth has been the blanket declaration that "a favorable balance of trade may be unfavorable."

Today there is no demand for gold. The world does not want it.

That statement is made point-blank, as a statement of fact. It is made to be understood by the masses, even though the classes will be disposed to misunderstand it, and for this latter reason it is pertinent to anticipate a challenge.

Gold Is Now Demonetized in Theory

THE United States today has, as is generally known, more than one-third of the actual gold supply of the world. This amounts to a monopoly that is disadvantageous for the business men who represent the genuine wealth of the country, and is profitable only to the gold dealers.

Economists profess to be mystified by the ease with which certain "bankrupt" European nations are doing business, but there is no secret about their functioning on a basis of their own currency. Those nations are not bankrupt in the sense that American critics point out; they are only bankrupt in relation to their gold supply, which is not bankruptcy at all.

Under the incubus of a gold-standard system, each and every nation, whether touched by the war or not, whether on the profiteering or losing side, is obliged, by a chain of circumstances involving international commerce, to transmute a certain part of its national production into gold, at the current gold value, so that this gold shall finally extinguish American credits, even though the process must mulct intermediaries that are in no wise concerned with the American-European economic snarl. This, by the way, accounts for the unsatisfactory condition that obtains in several neutral nations, whose international commerce has been more or less disastrously affected. Switzerland is a case in point.

It may not be so actually, but theoretically several nations are approaching the demonetization of gold, and if the process is retarded, it is due to the necessity of having to manipulate the metal for the benefit (?) of the United States.

The United States does not want to exchange commodities with other nations, even though the exchange of goods—not gold—is the ostensible object of money. The American plea is that "gold" was advanced in every case where a war debt to this country was contracted.

U. S. Gold-bricks the World by Exchange

BUT that is not so. The United States did not lend or sell gold to the nations that are now gold-poor. It lent them inflated gold values.

To digress a bit, it would be interesting if some high government authority at Washington would officially explain why it was feasible for the United States to accord credits to certain foreign governments on a basis of fixed foreign exchange that was normal, current and official, *until by common consent the units of foreign exchange were delivered by those governments into the hands of international money speculators.* Between that time and the present three years have passed. Would it not be ethical, not to say logical, to let the debtors pay their just dues on the same basis of value that was agreed to before the exchange institute was disbanded?

It is not necessary to give in detail the current market value of British pounds sterling, French francs, Italian lire, German marks, or their dizzy fluctuations between the day of the armistice and today. Suffice it to say that their dollar value is very low, between one-fifth and one-third, except for a late rise that has every earmark of transience.

Who profited throughout the intervening days?

Who got all the money represented in the losses between fixed official foreign exchange and the present loose speculative state?

The government has not received it. The people have not received it. The producers have not received it.

The international bankers have received it—every cent of it. They will continue to receive it as long as the interested party—the government of the United States—does not intervene to fix the exchange rates again.

The international bankers in this country a year ago had succeeded in scaling down British sovereigns to 3.86, francs to 7.18, lire to 3.64, marks to 1.60. Each unit reached a much lower level. Today it is somewhat higher. *But the difference between maximum value in 1919 and lowest value since then, commonly called foreign exchange, has been, and is nothing but, legalized stealing of the worst kind.* It represents *three and four hundred per cent of usurious profit* that because of its nature *could add nothing to the wealth of the country or the American people.*

It is literally gold-bricking the rest of the world. It is being done every day. Foreigners, who have little or no real use for gold at home, and even among themselves, are forced to buy to the limit of their ability so many millions of dollars of inert gold. This gold is sold by bankers. It is sold but it is not delivered. It is bought but it is not received. It is a fraud all the way through.

Foreigners have, to repeat, no need for gold except to pay certain American interests in gold. *The American people themselves are not selling gold. They have none to sell.* They have, however, commodities to sell—the very commodities that foreigners want to buy. But Americans are unable to sell their own goods, their real wealth, their very property, because a somewhat indistinct power decrees that no such exchange shall take place without gold.

And right here appears the very anomaly that the writer dares say no banker can explain: With no demand for gold, and the supply exceeding the demand, gold is at a premium.

Gold is at a premium, while wheat and cotton are at a discount, despite demand. If it were true that gold made for high prices, without distinction, then there would not be the discrepancy between values of commodities that exists today. Values would enhance or abate in the same ratio that gold was worth more or less, and it would be reasonable to expect that the value of gold at any time would be equal to the highest value of any one commodity, but instead it has come to pass that the most valuable commodities in the world—wheat and cotton—were at their lowest point when gold was at its highest.

In other words, the law of supply and demand does not affect gold, or gold is not subject to the law of supply and demand, as one wills, and this being the case, it is obvious that gold cannot be considered a commodity. It is so, theoretically, because such is custom, and business hinges upon that fallacious belief. Europe's desire for gold, moreover, must not be mistaken for demand—because Europe is doing without it, even to the extent of being unable to repay the United States.

Wallowing in Bullion Brings No Prosperity

COINCIDENTALLY, given the abnormally high value set upon gold, Europe and a best part of the rest of the world are learning to do without any of the desirable and even vital commodities that are forced to keep gold's pace, with results that business America is best qualified to wail over. There are two possible solutions: one is that the arbitrary valuation of gold will be broken as soon as new sources of supply will be made available in non-(or ex-)gold-standard countries, like Russia, and the other is that common sense will save the day through the adoption of fool-proof standards.

If, in spite of its troublesomeness, gold is at a premium—if it is so costly to get—it is evident that that premium is wished on by somebody.

Who establishes this premium? What is its purport? What good does it serve?

One of the tritest axioms of economists is that the gold standard establishes and insures us our modern and highly civilized conditions. This parroting school of economists—sworn enemies of the physiocrats—offers as examples certain peoples, like aboriginal tribes, as the lowest example of the "gold standard" scale. Now, to reinforce their argument, they point to the dire results that have supposedly followed the suspension of the gold standard by now standardless countries.

This ingenuous gentry seems to overlook, however, a very potent economic fact—that in either case the people mentioned are not suffering because of any inherent weakness in their mediums of exchange, be they cocoanuts or paper bills, but for other causes or reasons. The Chinese do not starve to death because their monetary system is not on a gold basis, but because nature is not always as kindly as it might be. But—and it is a big *but*—it is known of men and women in metropolitan centers of gold-standard, gold-hoarding countries being roofless, foodless, helpless!

Wallowing in the plenitude of gold bullion and gold coin has failed to bring about that utopia that every gold-standard-bearer freely predicted. Various phases of this problem have been discussed in preceding articles. The international money side of it is treated here. Goldless Germany is humming, busy, productive. Gilded United States is stagnant, timid, lopsided. The two peoples represent, individually, almost identical industrial units. This conclusively shows that there can be nothing wrong with the American people themselves. Consequently something else must be wrong. And that something is the gold standard.

Of course, those who have an interest in protecting this standard wish to protect it. It is their pet interest. Not only nearly all of the bookkeeping wealth of the nation is represented by it, but all of our fiscal and financial and commercial laws are predicated upon it. To admit the fallacy of the gold standard would be the equivalent of reinventorying the nation's wealth—the remaking of nearly all our laws. This would cost money—and there would be no more opportunities for manipulating monetary units. Hence, the disqualification of the gold standard is blamed on the war, but, because this excuse is becoming ancient and unconvincing, Europe is being blamed instead.

What is happening? There never was a more panicky feeling permeating the arteries of so-called American big business as today. There never was a more debasing, calculative, penny-pinching policy. An illusory prosperity has been conceived of the gold standard.

The world, or the greater part of it, is paying in money, goods, and happiness a set of middlemen who, by profiting upon the fictitious exchange of fictitious moneys, get sellers and purchasers both going and coming. What was a harmless enough operation during pre-war days has now become, by virtue of the economic war that has divided the United States from Europe, parasitism, graft, robbery. It is lawful financial predacity, but that is the very best that can be said for it.

The profits to be derived from dealing in foreign exchange increase with the depreciation of foreign money (in this case it being understood that the dollar is the current gold unit of value). Foreign exchange plays both ends toward the middle, and the result is a squeeze for the hapless. On its face it promises to pay the highest rates for the depreciated currencies and sell the dollar at the lowest rate. It seems simple, and it is, for the dealer, but whether one sells dollars or foreign money, the banker or speculator never loses.

The Game of Graft Called "Foreign Exchange"

IN ORDER to make this game clear, it should be remembered that foreign exchange mainly consists of selling or buying two things—bills of exchange, which are international bankers' checks, and foreign moneys. The actual exchange of money of one nation for the moneys of any other nations represents a relatively negligible quantity of daily foreign exchange operations. In general, it means a system of bookkeeping. One, therefore, buys bookkeeping, plus as big a premium as traffic will bear.

Reputable bankers, of course, do not regard foreign exchange as one of their major profitable operations, at least not in this country, and especially in the light of recent experiences of American business in foreign trade. With them it is a necessary evil. But foreign exchange, largely because of its legendary intricacies, is a veritable bonanza for the speculative banker, the brokers, and, especially now, the "garlic banks," the latter having become get-rich-quick concerns, operated on shoe-string capital (even check-kiting) as to warrant drastic Federal and state action.

Prior to the war there were not, according to the dictum of a prominent Wall Street banker, five American citizens who were expert foreign exchange men. The international banks employed Germans and Englishmen, who have always excelled in this work. They are known as "traders." But prior to the war, let's bear in mind, both of those nations—England and Germany—were supreme in foreign trade, and they raised their traders and sent them abroad not with a view of speculating, but to grease the ways for British and German commerce, respectively. Today every New York bank of any importance at all has its traders, but they are speculative traders.

An attempt was made, unsuccessfully, to dictate the foreign exchange rates in New York. London, today, has resumed that dictation, and sterling bills of exchange are again the best international medium. There is such a thing as the New York rate and also the Paris rate, but the basic and operative rate is the London rate. It is cabled abroad so that every important bank the world over may have the right quotation as early as possible every morning.

Gold Standard Is "The Last Nostrum"

WERE it not for the forced demand of dollar exchange, through the concerted demand of American bankers having credits abroad, foreign banks in New York could sell dollar exchange for less than the rate established by New York, and very often they do, and this leads one to suspect that as soon as that international neutral financial point for which Europe is jockeying has been reached, the American gold standard will cease to be the determining factor, and a break will come.

No one in authority has yet publicly admitted that Europe is unwilling to abide by the gold standard as practiced by the United States, even though this, in turn, is originally a European value. Whether it would be denied is doubtful.

It has been alleged that England is observing the gold standard as is this country. England is and England is not. England is a most plastic nation, financially, and readily adapts or accommodates itself to conditions elsewhere. Moreover, England is a nation of foreign trade assorters and forwarders, as it were, and has made its profits upon its swift and repeated turnovers. England today sticks to the gold standard because British indebtedness to America on the one hand, and a lack of inter-European co-ordination on

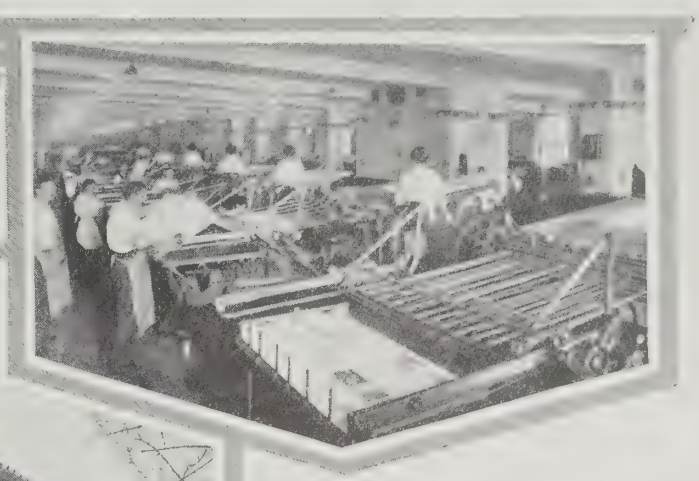
Where Billions of Words Are Put Into Type

Uncle Sam Owns and Keeps Busy the World's Largest Print Shop

By GEORGE H. DACY

TO COMPARE the primitive printing press of Benjamin Franklin with the marvelous multiple presses of the present is no more difficult than to attempt to measure the operation and output of the government printing office—the largest printing shop in the world—in terms of the activities of the great metropolitan dailies. Uncle Sam's mammoth printery—it covers 14 acres of floor space—employs 4,500 persons and prints and distributes the equivalent of 750,000 columns of ordinary newspaper matter annually, equal in volume to 18,000 miles of words—is superior in size and output to any other establishment of its kind in existence.



Sixty-one years ago, Uncle Sam embarked in the printing business, because at that time the costs of contract printing were climbing high and he was convinced that, with a print shop of his own, he not only could decrease the expenses associated with printing the vast numbers of government reports and publications, but also could produce a better average quality of work. Gradually the government printing office has been extended and expanded until, at this writing, approximately $2,500,000 has been expended for buildings and an additional $2,800,000 for machinery and equipment. During a recent year, it cost $12,674,000 to operate the huge project. Of this amount about 42 per cent represented wages of employes.

One of the large web presses in the government printing office, adapted for printing and folding four 16-page forms simultaneously.

The government printing office in Washington is the largest in the world and covers 14 acres of floor space.

The special presses used at the government printing office for half-tone, color and illustration work.

An idea of the gigantic scale on which the G. P. O., as the government printing office is called around Washington, operates is illustrated by the enormous amounts of coal, gas and electricity consumed yearly in keeping the plant going at full speed. Recently, during a 12-month period, it required 14,000 tons of coal, 16,456,000 cubic feet of gas and 4,500,000 kilowatts of electricity to run the printery. Considerable of this power was used in running the batteries of presses of every sort and description. The main press room contains 152 presses, which include all kinds and classes from small, hand-feed types to the most mammoth modern presses adapted for printing and folding four 16-page forms simultaneously. Ninety-three of the presses are equipped with automatic feeds. In the linotype room are 86 of the best machines of this class available. In the monotype room are 100 of the monotype keyboards. At present, more than 14 tons of metal are used daily in the manufacture of type.

The western farmers who study the bulletins distributed by the United States Department of Agriculture, the seamen and mariners who receive the government reports on tides and conditions, the physicians who read the publications issued by the Public Health Service, the lawyers interested in Treasury decisions and income tax rulings, the bankers who watch for the Federal Reserve Board reports, the exporters who await the government reports on foreign commerce, the geologists and weather experts who scrutinize carefully all government literature issued on their pet subjects, the coal mine operators who keep up on coal mine fatalities, those interested in vocational education, fisheries, lighthouses, education, reclamation, labor statistics, post office reports and the latest scientific news about agriculture, all are served by the government printing office. This master-printery does all this work. All this literature is distributed by the various bureaus and departments, and the readers who benefit by the material rarely know that the bulletins and circulars are printed by Uncle Sam in his enormous print shop.

Last year, George H. Carter, public printer, who is director of the government printing office, handled more than 85,000 separate and distinct jobs of printing, which ranged anywhere from one dozen to more than 200,000,000 copies to the order. A total of 170,000 forms were sent to press, while the electrotype and stereotype plates used amounted to more than 15,000,000 square inches. Mr. Carter publishes two daily reports, the bulletins of the United States Consular Service and the *Congressional Record,* as well as 10 other weekly publications and 19 monthly periodicals as incidentals to his voluminous assignments in job printing. This is why the G. P. O. is the busiest center of publication under the sun. It is an emergency office that always must be prepared to perform last-minute, rush-order assignments.

The publication of the daily *Congressional Record,* which records the doings of Congress, is considerable of a job in itself. This paper ranges in size from 10 to 200 pages. It is circulated daily among 35,000 readers. Sometimes, Congress is in session until as late as 1 or 2 o'clock in the morning, yet the *Congressional Record* must be printed and ready for distribution by 6 o'clock. This means the application of the highest efficiency in printing. A record was established one night last summer by the G. P. O. that probably will stand for many years. In four hours, a special issue of the *Congressional Record* containing 64 pages and aggregating 32,000 copies was printed and delivered to the distributing agencies for circulation.

Some of the 125 monotype casting machines in one of the huge rooms at the government printing office.

The cheapest book in the country is the annual year book of the Department of Agriculture. Despite that this volume is cloth-bound and contains nearly 900 pages, it is sold by Uncle Sam for $1.25. The demand for this publication about farms and farming is so great that more than 381,000 copies have to be printed. All the government publications about farming also are printed by the G. P. O. They cover a vast variety of subjects.

The government printing office operates at full capacity all the time. It may have enough jobs on hand to keep it busy for six months. The President may send in a special message or Congress may wish to issue a report posthaste. The G. P. O. has to drop all its routine work and get busy on these rush orders. Such interruptions are liable to occur any minute.

All the postal cards used annually in the United States—more than 1,250,000,000—are printed at the government printing office. Two of the most ingenious machines in the plant were designed and perfected expressly to print, trim and pack the postal cards. Each of these presses can turn out 4,000,000 cards a day. During rush periods, when there is an unusual demand for postal cards, the presses are worked day and night. Many of the postal cards are sent out in the form of perforated sheets, 48 cards to the sheet. The present plan is shortly to begin the issue of 96-card sheets in addition to those now in use.

If all the postal cards we use each year should be placed in a pile flat side up, they would extend 200 miles above the earth. If they were placed end to end, they would extend four and one-half times around the world at the equator. If all the work connected with the production of our vast supply of postal cards had to be performed by hand, Uncle Sam could never afford to circulate the cards at a penny each. The efficient postal card printers aid, however, in cutting costs. Each of these machines cost $20,000. Large rolls of paper that weigh 1,000 pounds each are carried on a gravity rack into the postal card room. The wrappers are stripped off and sample pieces of each roll are submitted to the post office inspectors in the room above for official testing. The roll is then placed on the press. Each roll makes 200,000 cards. Hardened steel plates print the impressions, there being 96 of these plates on each cylinder or drum, of the press. There is a special attachment on each machine for printing reply cards. The machine prints, folds, perforates and marks the address side of the cards. A series of rapidly working knives cut and trim the cards and deliver them on a rack, where they are counted and packed in piles of 50 each. A post office inspector stands beside each machine during operation and examines the paper to see that it conforms to government requirements.

The inspectors who test the postal card paper first weigh the material to see that it corresponds to weight requirements. Then, on a special testing machine, they subject samples of the paper to tensile strength tests. Another delicate machine, an automatic micrometer, then determines the thickness of the paper. Thereafter, the sample is tested for finish and, later, it is subjected to a special chemical test to ascertain if it contains any ground wood. Finally, the paper is subjected to writing tests to determine if the ink dries on it properly without blurring or blotting. Between 7,000 and 7,500 rolls of postal card paper are now used each year to supply enough postal cards to satisfy the demand. About six pounds of paper is required to make 1,000 postal cards.

Uncle Sam's print shop also produces all the tabulating cards used by the United States Census and the Army and Navy departments, these orders amounting to approximately 250,000,000 cards a year. Special machines have been designed and improved for this work. They print the cards on either or both sides, clip off the corners, number the cards and perforate them.

Mr. Carter and his assistants at the government printing office prepare and print all the money order applications and money orders for the United States post offices. Nine hundred thousand domestic and international money order books—each book contains 200 individual orders—are printed each year. Three special presses which print the money orders in two colors, but can print in three hues if desired, are used.

The yearly purchases of the government printing office are necessarily enormous. Last year more than 50,000,000 pounds of paper was converted into government publications, reports and circulars. It required 100,000 pounds of ink to print the text matter on this paper. If this huge amount of paper were spread out on the ground it would cover an area 135 miles square, while the ink—all of which is made at the government print shop—would be adequate to color many rivers.

In the neighborhood of 65,000,000 public documents in the form of bulletins, reports, reviews and results of research investigations are annually distributed by the Division of Public Documents of the G. P. O. It maintains a mailing list of 1,100,000 names. It receives 325,000 letters of inquiry a year.

Civilization Is Founded on Respect for the Law

Without It, Mankind Becomes Primitive, Says Attorney-General Daugherty

By A. R. PINCI

"CONGESTION in the Federal courts, due to the ordinary increase of population and the development of commercial and industrial America, has been an ever-increasing weakness in the machinery of Federal justice," said Attorney-General H. M. Daugherty in an interview for THE DEARBORN INDEPENDENT. "It is no uncommon thing for a district court docket to be from six months to two years in arrears. This, of course, means loss of evidence, death of witnesses, defeat of justice, and expense to the taxpayers. Many criminal cases can never be tried. Business interests vitally affecting the public at large lose heavily through delay. Recently the congestion became so serious as to demand immediate relief, which could not be procured by the creation of permanently assigned judges without a great burden on the Treasury, as in my opinion at least 30 judges would be necessary if permanently assigned.

"There is a generally congested condition in the Federal dockets throughout the United States; there are as many as approximately 5,000 cases pending and undisposed of in single districts. This congestion is due to the natural growth of the country, but is temporarily aggravated by legislation of Congress, increasing the jurisdiction of the Federal courts, by war legislation, shipping and railroad operations on the civil docket, and prohibition, selective service, and the narcotic law on the criminal docket. It is thought that the generally congested condition throughout the United States, due to these new laws and temporary war conditions, will show a decrease after a few years. As the reconstruction period passes and the people become adjusted to the new conditions, there will be, in my judgment, less violation of the national prohibition and other Federal laws in the nature of regulation. Then, too, as the states enforce these laws, there will be relief for the Federal courts.

Judges-at-Large Would Be Big Help

"HENCE an elastic method of relieving this congestion would be the most efficient and least expensive one. I, therefore, created a voluntary commission of three Federal judges, two United States attorneys, and an attorney of the Department of Justice to assist them.

"The commission has recommended 18 Federal judges-at-large—two to be appointed in each judicial circuit—to be assigned as needed. In those districts where congestion is permanent and due to normal growth of business, there should be additional judges, but in many districts the congestion is but temporary and can be relieved by the use of a judge-at-large who will assist in clearing the docket and then proceed to another district.

"As this is an emergency, I trust that Congress will pass the necessary legislation as soon as possible. Federal judges-at-large will permit elasticity in the Federal judicial system and economy in the handling of temporarily congested dockets. It will encourage uniformity in judicial procedure and prompt expedition of business, for as these judges render services when necessary in any district where assigned, they will receive and carry with them the beneficial practices of each district and thereby become familiar with reforms and improvement in practice.

"An annual meeting of judges from each circuit to consider ways and means of improving Federal procedure and handling congestion as it may arise also has been recommended. Justice cannot be measured in dollars and cents, but it is my opinion that this annual meeting and the creation of 18 Federal judges-at-large will be a real economy and assist materially in maintaining the high standards of the Federal courts, which are, after all, the backbone of a government by law.

"There are many problems which are faced day to day by the Department of Justice, and, that the American people may understand the principles on which they are decided, it seems fitting to refer to the general subject of respect for law, or rather, to enumerate for their consideration some of the things that tend to undermine the law.

"This subject is not new; few vitally important subjects are. It is, however, timely.

Supremacy of Law Is Not Undermined

"THE fact that there is a congestion in American courts does not mean that we have been suddenly ushered into an era of lawlessness. No attempt will be made to prove by statistical or other methods that lawlessness is increasing. My purpose will be mainly to call attention to certain theories of political philosophy advanced by those who either violate the law or sympathize with law violators as a defense and justification of their course. Some of these theories are as old as constitutional government, and have been advanced from time to time by those who have sought to evade the penalties of the law.

"Respect for law is the one essential fact of our civilization. Without it, life, liberty and property are insecure. Without it, civilization falls back to the chaos and anarchy of primitive times. Under such conditions, each human being is compelled to attend primarily to his own safety and to the protection of his own property, and has neither time nor opportunity for intellectual, moral or spiritual development. Through all the centuries men have striven for the protection of law and order; mankind has paid allegiance to lords and overlords who were able to give this protection.

"Our present civilization did not come by chance. It is the result of labor, toil, and consecrated service of hand and mind and heart. The wealth of our day in all its forms is but the surplus of what man has produced and saved over what he has consumed. By the term wealth in this connection I do not mean material wealth alone. It includes every product of mind as well. Every triumph of mind or spirit that makes for higher and better living today is a part of the world's wealth.

"It is often said, I know, that this is the wealthiest and at the same time the most materialistic age in the world. That is true in a certain sense, but it also is true that the common wealth of the age, as well as the sum total of individual wealth, furnishes the opportunity for the achievements that have been accomplished. Our schools and colleges, our libraries, our homes of comfort, our means of transportation and communication, and all our means of enjoyment of life, are physical conditions necessary for spiritual as contrasted with material upbuilding.

"Of course, human life is the supreme object above everything else of all government. Property is subservient to the majesty of the human soul. Yet, if the history of civilization teaches one lesson beyond dispute, it is that the development of the spirit is intimately interwoven with the conservation of the world's wealth. This affords the opportunity for education, for culture, for study, for enjoyment, for the pursuit of happiness in its various phases, and is, in any civilization, intimately connected with its stored-up wealth. Hence respect for the law is the *sine qua non* of our civilization.

"The supremacy of the law, though challenged, is not undermined by the ordinary criminal who commits murder, robbery, larceny, and so on. On the contrary, every crime of this sort tends to impress on society the profound importance of the supremacy of the law and its vigorous enforcement. The supremacy of the law is and has been challenged mainly in that class of legislation where there exists a difference of opinion as to governmental policy in enacting the legislation in question.

"Disrespect for the law has manifested itself in the past mainly by large corporations or aggregations of wealth, commonly known as big business, and by labor organizations in relation to such business. At the present time among the forces that are undermining respect for law are the following: The doctrine of so-called political offenses, erroneous conceptions of personal liberty, and false doctrines as to the rights of individuals and minorities. These may not be the only sources of disrespect for law, but they are deserving of attention at this time, because their proponents have been especially active in asserting them since the World War.

Law Violation Is Contagious

"BECAUSE of one hundred years of practically uncontrolled freedom of conduct, large corporations and aggregations of persons and capital have resented the interference of laws regulating them in the interest of the people as a whole. This has been a mistaken attitude.

"The attitude of contempt for law, resulting in an effort to evade and violate it, is suicidal to business, for it removes its only support. Business should see that its security lies in obedience to law; that the whole doctrine of private property depends upon law; that law violation is contagious, and, therefore, that all other classes of society can adopt toward property and the persons who own it the same methods and the same attitude.

"The attitude of big business, at times, that it is above the law, also has stimulated the spirit in the public that lawlessness must be met by lawlessness; that one unlawful act by an element of society must be challenged and met by another unlawful act. This, of course, breeds a growing disrespect for law. These acts of lawlessness are contagious, so that the law violator all along the line thinks that he is only following the example set for him by those agencies of business that were strong enough and well enough entrenched to violate the law with impunity. The hold-up man is the counterpart of the profiteer. The lawlessness of labor is the counterpart of the lawlessness of capital. The lawless employe is always an apt pupil of a lawless employer.

"Labor organizations have been opposed by many in principle, especially the employer class. Whether economically wise or not, it is not material to discuss here. In passing, it may be said, however, that most fair-minded persons feel that, in the absence of regulation by government for his protection, the man who toils is at an unfair advantage, dealing as an individual, with his more powerful employer, who often represents large aggregations of wealth. For this reason, society, as a whole, has not opposed these organizations for the protection of labor, the practical fact being that one combination of men has been brought face to face with another combination of men. The concern of society is that it has been the innocent victim of the struggle between the employer and the employe.

"Although there seems now to be a commendable spirit on the part of the employer representing so-called 'big business' on the one hand, and the employe composing labor groups, on the other, the efforts in working out a harmonious understanding between capital and labor so as to avoid injury to the public have not made the progress that the friends of good government have wished.

"It is of no avail to preach the doctrine that each of these elements when it understands the other will do the right thing. The men who preach this doctrine, whether they be theorists or practical captains of industry or labor leaders, are usually the class of men who themselves are willing to do the right thing. To these men the love of justice is the prime consideration. Unfortunately, they are the exceptions. Therefore, since the general rule in business is that the employer wants to obtain service on the most advantageous terms to himself, and the employe wants to give service on the most advantageous terms to himself, the conflict is ever present. The clash of interests is always a controlling factor.

"That the public is a vitally interested party is admitted by all. Yet it has little guaranty from law that its rights will be protected. It has seemed to me, therefore, that there ought to be laws to which either party to the controversy could appeal for the settlement of any dispute that arises between employer and employe so that the public, as well as the parties, should not be subjected to the hardships resulting from controversies between these two factors of industry.

"This does not mean that either the Federal or state governments should enact a code of legislation binding and tying the hands of these two factors in settling their disputes. Strikes and lockouts, and similar things, ought to be unknown. It seems desirable that there should be, however, some agency in government to investigate the facts of each case as it arises, make a finding, and publish it to those concerned. Such publicity, in most cases, will be all sufficient to settle the question without further action.

They Do Not Get at Root of Trouble

"IN THE past we have had legislative investigations, commissions of inquiry, boards of arbitration, and so on. The great weakness with these boards and commissions has been that their main purpose has been to get the parties together in the immediate controversy, instead of making examination of the facts and reporting a finding in the form of a decision on those facts in which the general social, economic and moral principles of justice that should control each case would be set forth. If such a thing were done, these reports would in time acquire a value in furnishing a safe and sane basis for determining relations and crystallizing public sentiment in relation thereto.

"Society is vitally interested in the proper solution of this question. When some such plan shall have been put in operation, then we will have a more intelligent basis on which to enact compulsory legislation on this subject.

"Disrespect for the law is not always created by specific acts merely, but by attempts to justify these acts by certain theories of political philosophy, of which there are several. An important one of these that undermines respect for law, especially prominent at the present time, is an erroneous theory of personal liberty under our constitutional system. This controversy is as old as government itself. It has been asserted with especial vigor recently, owing to the Eighteenth Amendment to the Constitution of the United States and to the amendments in the various state constitutions, and because of legislation on the same subject by Congress and the various state legislatures.

"The question of the limitations of personal liberty is in the first instance a question of political philosophy and not of law. The advocates of personal liberty have ranged all the way from those who favor the widest measure of license to the individual to do as he pleases, on the one hand, to those who would restrict the individual by the most puritanical standards, on the other hand.

Urges Obedience While Law Exists

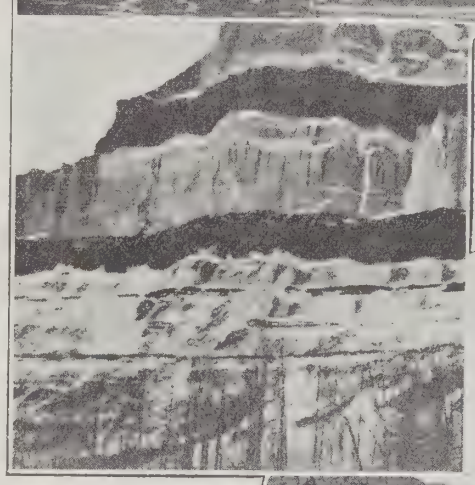
"AS LONG as they remain purely speculative questions in the realm of the political philosophy proposed by their respective advocates as the basis for social organization, there is and can be no objection to them. Every one has a right to advocate any view he pleases on this subject. However, when public sentiment has crystallized into law, there can be no question as to the duty of good citizens with reference thereto. They may still debate as to the wisdom of the law, but there is only one course of conduct—and that is obedience to the law while it exists.

"From the standpoint of government, the only sound view is that of law enforcement. Whatever differences of opinion exist in the views as to the wisdom of some of these laws can be of no concern to the agencies for law enforcement. Our constitutional system is so organized that at the ballot box the sovereign elector expresses his will. Changes are to be wrought through the constitutional organs of government and by the orderly processes of law.

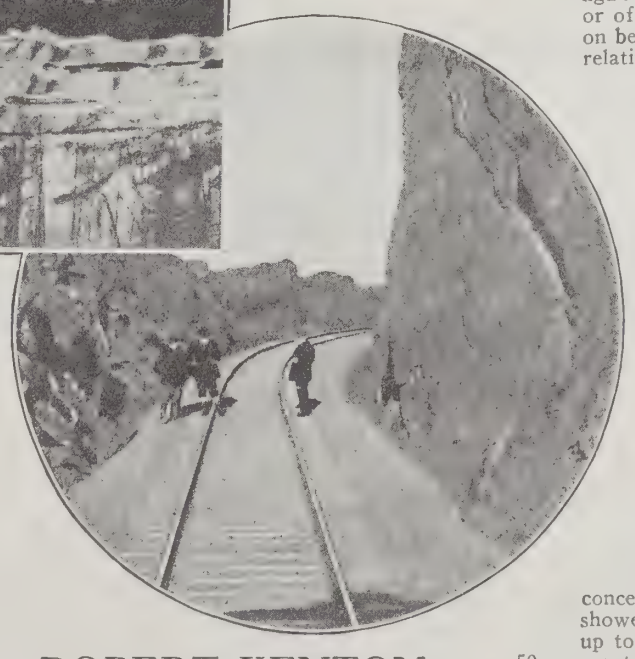
"Another phase of political philosophy of the times is that involving subversive foreign racial movements and ultraradical propaganda. The Department of Justice, through its general intelligence division, has been carefully observing and following the trend of the ultraradical movement in the United States, including the activities of anarchists, communists and syndicalists. During the last year or two the communist parties of the United States have united into a combined organization, formed for carrying on communist propaganda more effectively.

"In conclusion, if laws are obnoxious to the people, it is their province to repeal them. Until they are repealed they must be enforced without fear or favor. Those who do not believe in our government and the enforcement of our laws should go to a country which gives them their *peculiar liberty*."

Steamship Monopoly Stifles Alaskan Trade



"Interests" Owning Line Accused of Discrimination Against Pioneers



A section of the water front at Seward, Alaska.

Alaska is still primarily the land of the pioneer, who says he is being exploited by big corporations.

Seams of coal, as shown in the picture, are clearly apparent in several Alaskan districts, yet the territory is dependent for its coal on outside shipments.

A view along the line of the government railroad in Alaska.

By ROBERT KENTON

Second and last article on "How Neglected Alaska Is Being Throttled."

IN THE words of Secretary of the Interior Fall, the railroad the government is building in Alaska at an ultimate cost of not less than $56,000,000 "starts from nowhere and goes nowhere." This is probably the reason why Alaskan prospects have not improved as the time for the complete operation of the road has approached. In fact, as stated in a previous article, those prospects appear to have declined as the railroad took on completed form

The railroad "starts from nowhere and goes nowhere," because it has no established, or rather, no guaranteed, connections. Its northern terminus is almost in the center of Alaska and at best only touches the river transportation system of the Yukon. The southern terminus is at Seward, on the coast of Southern Alaska. The rail systems of the States and of Canada are many hundreds of miles away.

Thus the government's railroad figuratively is suspended in the air, with dwindling business and decreasing population in its territory.

This is why ocean transportation is of such importance to Alaska and Alaskans. Without adequate steamship service at reasonable rates between Alaska and the States, development of the territory must be confined largely to the operations of big corporations, which own their own means of transport.

According to statements made at recent hearings in Washington, the interests which own the steamships that supply such ocean transportation facilities as Alaska now possesses, have a mighty club that can be more than merely waved over the heads of Alaska residents. As stated in a previous article, the chief of those interests are what is known as the Morgan-Guggenheims, the last half of the hyphenate being dominant.

"Whenever we made an effort to have transportation rates reduced," John Rustgard, attorney-general for the Alaskan territorial government, declared before the United States Senate Committee on Territories a short time ago, "there always was a rumble in the air that unless they could charge the rates they pleased, the boats would be withdrawn from the Alaskan routes and we would be left without transportation. I assume it was for this reason that whenever we in Alaska undertook to apply for a reduction of rates, or to protest against an increase in rates, the Chamber of Commerce, of Seattle, Washington, officially requested the United States Shipping Board to let the rates be increased."

Mr. Rustgard called attention to at least two instances when the Seattle Chamber of Commerce came to the defense, he said, of the Alaskan shipping interests.

The attorney-general called attention to a war legislative incident that would seem to demand more explanation than the available records on Alaska divulge. In an effort to relieve the shipping crisis and help with the food problem, which came upon our entering the war, Congress authorized the United States Shipping Board to suspend the law forbidding the handling of coastwise traffic in foreign bottoms whenever the board thought it desirable to do so. This was to prevent the absurdity of vessels of our allies going from one American port to another without cargo, when tons of freight might be waiting for means of transport. But Congress added a proviso that the Shipping Board should exercise no such discretion with regard to shipping from Alaska, which in only a technical sense is coastwise. Mr. Rustgard declared that a friend of his who happened to be in the offices of the Alaska Bureau of the Seattle Chamber of Commerce on the night when news of the congressional proviso about Alaskan traffic came in told him later that there was "general rejoicing" at the bureau over the news.

Of course, one can understand why Seattle, the neck of the bottle which is Alaska, would be jealous even in war time of its trade with the territory in the Far North—a trade which Canadian cities have made constant efforts to induce away from Seattle.

Alaska's fishing went ahead, and was encouraged to go ahead with redoubled effort, with the view of helping to relieve the food situation in the States.

"A great many times I saw fishermen come in from the fishing banks loaded with fish, which would have to be dumped overboard because there was no boat to carry the catches away," Mr. Rustgard declared before the Senate committee.

Ultimately, it developed at the committee hearing, the Department of Commerce virtually amended the act of Congress by nullifying the exception of Alaskan trade in the matter of foreign bottoms. It announced that if any foreign vessels were fined for handling Alaskan traffic with the States the penalties would be remitted.

"At that time," Mr. Rustgard said, "fish was rotting on our wharves, to my knowledge, for lack of transportation, and many of the fishermen pulled their boats ashore and quit because they could not get transportation to the markets, while British vessels were passing our wharves regularly."

The exception, he stated, evidently was written into the law "to strengthen the present transportation companies so that they would not withdraw their ships from Alaskan runs and ruin the territory." In the denials made to the Senate committee the trustees of the Seattle Chamber of Commerce declare that they know nothing of any protests being made by the organization against appeals from Alaskans for lower rates, or of any action having to do with the exception on behalf of Alaskan shipping in the war statutes relating to foreign bottoms in coastwise trade.

Mr. Rustgard gave testimony to the Senate committee on rates charged by the two shipping companies which control Alaskan traffic.

He declared that the rate for general merchandise from Seattle to Juneau is $9, against $4 from Prince Rupert, the nearest Canadian port. At the same time the shipper to or through Seattle, he claims, has to meet large handling charges—larger, in fact, than the handling charges imposed on the shipper to or from Hawaii and the Orient—while at Prince Rupert and other Canadian ports there are no such charges.

"There is no port in the United States where port charges are so high as in Seattle," he declared. "They are four times as high there as in San Francisco."

The attorney-general filed with the Senate committee a copy of a report he had prepared for the governor of the territory on the earnings of the Alaska Steamship Company, the Morgan-Guggenheim concern. He declared that his investigations showed that the company "for the last six years up to the close of 1920 had earned approximately 50 per cent annually on the money invested." However, that did not come solely from Alaska shipping, which, representatives of the company claimed, had not yielded more than two per cent profit annually, as the company operates vessels on other runs.

The shipping company filed rate lists which would indicate that charges on independent traffic to and from Alaska are not higher than those on traffic between California ports and Seattle.

Those who claim that Alaska is being throttled by a shipping monopoly, assert that excess charges imposed on Alaska traffic come through manipulation of the rule that tonnage be defined by either weight or measurement at ship's option. They say that measurement is used very little in fixing charges on freight from California ports to Seattle, but that it is applied in the other direction whenever measurement favors the shipping company.

Just as this is being written there appears in the *Congressional Record* an address on the subject, delivered in the House of Representatives at Washington by Dan A. Sutherland, delegate from the Alaska territory.

It contains tabulations of actual collections on sev-

Reuterdahl vs. Einstein: Nailing a Fallacy

Former Insists Latter's Theory Wrong and Questions Its Originality

By E. LEE HEIDENREICH

AS THE Einstein enthusiasm is waning, we may well ask what thoughts and influences have caused this slowing down of the meteorical rise and advance of Einstein in giving the study of relativity its tremendous and unexpectedly sudden impetus.

The History of Relativity shows us that in 1889 Rudolf Mewes, in an article entitled, "Das Wesen der Materie und des Naturerkennens," gave a brief outline of his theory of relativity. Mewes held that the essence of matter consists in its action as manifest in continuous transformation in accordance with causality. He found in his basic concept a source of the relativity of space, time and matter. For him all reality depends upon the combination of space and time.

From 1892 to 1894 Mewes made a careful analysis of the derivation of *Weber's Law* from the *Doppler Principle*. This resulted in the evaluation by Mewes of the transformation formula which later made Lorentz famous through its use by Einstein. Mewes clearly antedates Larmor, Lorentz and Einstein in this development. In addition, Mewes grounds his system in sound philosophy.

Arvid Reuterdahl presented a brief outline of his Space-Time Potential and Theory of Interdependence at the inaugural meeting of the American Electrochemical Society, held in Philadelphia, April 5, 1902, under the title of "The Atom of Electrochemistry." In this lecture Reuterdahl showed that the physical universe is ultimately reducible to centers of activity which undergo compensating changes and displacements in conformity with the requirement of the whole cosmos regarded as a unitary, interacting and interdependent system of multiplicity, which is its own continuum.

What the Records Show

J. HENRI ZIEGLER, in September, 1902, laid the foundation of a cosmic theory in a lecture entitled "Die Universelle Weltformel und ihre Bedeutung fur die wahre Erkenntniss aller Dinge." Ziegler's cosmology is based upon the fundamental conception that the world is a unitary structure generated from the universal trinity of space, time and force, with the inclusion of an Absolute Principle, the constancy of the velocity of light.

In "Einstein and the New Science," Arvid Reuterdahl gives us the history of relativity, and gives a most concise chronological account of the authors and scientists preceding Einstein in the study of the theory of relativity—but also at the same time gives a serious blow to both the originality and the validity of "Einstein's Theory of Relativity." In this little book of 26 pages of concentrated facts, we find that Reuterdahl commends, lauds, encourages and acknowledges with the greatest freedom the works of the many scientific contributors, and in an article in THE DEARBORN INDEPENDENT of April 30, 1921, entitled, "Kinertia vs. Einstein," gloriously defends the great work of "Kinertia," although we know that Reuterdahl and "Kinertia" do not entirely agree in their ideas. But it shows Reuterdahl's unselfishness and fairness in contraposition to Einstein's avoidance of acknowledgments to the most important of his predecessors.

Reuterdahl has, in the past, been wilfully ignored. Attempts have been made to intimidate him and his work has been practically suppressed by the machinations of his jealous enemies. Undaunted by these obstacles, Reuterdahl's faith in the ultimate victory of truth remains unshaken. Now the time has come for someone who knows the facts to present to the world the truth concerning Reuterdahl, the man who dared to challenge Einstein, the alleged superman of science.

Back in 1913, Reuterdahl discussed with me in Kansas City his "Space-Time Potential, a conception of Gravitation and Electricity," and had his manuscript typewritten in my office. I spoke about the subject on my lecture tours covering other matters, and with the result, that in December, 1914, Reuterdahl was invited to lecture at the Kansas State College of Agriculture and the University of Kansas, which lectures were given early in 1915.

Shortly after, I had the manuscript, which was copyrighted, sent to Professor Stormer at the University of Christiania, Norway, who, after reading it, forwarded the manuscript in May, 1915, to Professor Mittag-Leffler in Stockholm, Sweden, where it apparently lay for five years, till the summer of 1920, during which time both Reuterdahl and I tried to recover it. I visited Christiania in June, 1920, and found that the manuscript had just been returned to Reuterdahl in St. Paul, Minnesota, with a letter from Mittag-Leffler, dated June 14, 1920, regretting the delay. Dr. Einstein, who visited Christiania in June, 1920, was confronted with an article in the *Aftenposten* containing a brief synopsis of Reuterdahl's theory of "Interdependence" as compared with Einstein's "Relativity," and then professed never to have heard of Reuterdahl.

In referring to the above article, Einstein said: "I do not know Reuterdahl's name and have never heard that he had worked on the Theory of Relativity. I have often corresponded with Professor Mittag-Leffler, but he has never mentioned such a work."

In the meanwhile, about 1916, Einstein commenced to use Reuterdahl's copyrighted expression "Space-Time" in such combinations as "Raum-Zeit-Kontinuum," "Raum-Zeit-Funktionen" and "Raum-Zeitkoordinaten" in "Die grundlage der Allgemeinen Relativitatstheorie" (Annalen der Physik, Band 49, 1916.) Einstein's use of the hyphen at this time and not in his former works may, however, be a *coincidence*.

Subsequent statements by Einstein, however, seriously weaken the supposition that his use of the hyphen between "space" and "time" is a mere *coincidence*. In a statement given to the New York *World* (June 12, 1921), he again disclaims all knowledge of Reuterdahl. This disclaimer is irreconcilable with his own previous statement to the *Aftenposten*. The question naturally arises: "Why was Einstein so anxious to efface the name of Reuterdahl in connection with the Theory of Relativity? Does the five years' sojourn in Europe of Reuterdahl's manuscript answer this question?

Reuterdahl finally in 1920 published his great work on the "Space-Time Potential," a new concept of "Gravitation and Electricity" under the revised title, "Scientific Theism vs. Materialism, The Space-Time Potential," a complete cosmology. After 1916 Einstein also turned to cosmological speculations, and "Kosmologische Betrachtungen zur allgemeinen Relativitatstheorie" appeared in 1917. *More coincidence!*

We will now endeavor to put in plain language how Einstein has tried to tie his Special Theory of Relativity to a physical universe. In the latest phase of his work he strove for a great synthesis which would unite, under a broad conceptual structure, all the known facts of the physical universe. He desired to create conceptually a complete worldsystem (Weltsystem). His special theory of relativity was an isolated product which lacked genuine contact with the physical universe. In the "General Theory of Relativity" Einstein attempts to overcome this difficulty. He tries to avoid the limitations imposed by a *particular frame of reference* by creating an all inclusive *world reference frame* within itself capable of harmonizing physical law and action. Physical action in both the *inter-atomic* and the *inter-stellar* worlds, in this proposed synthesis, must be phenomenal exemplifications of the laws of the single *world reference frame*. Any portion, large or small, of this *world reference frame* has an equal right to be regarded as a genuine and reliable reference system because the laws of the great frame are the same throughout all its parts. The relational factors which pertain to an infinitesimal portion of the great frame are the same as hold for a part conceived as great as the imagination may permit in conformity with the frame.

The Einsteinean *world reference frame* is Gaussian and four-dimensional in type, the co-ordinate system being an attempt at the *amalgamation* of space and time. Any reference section arbitrarily cut out of the frame is a veritable co-ordinate fabric. Such section has been called a *"Reference-Mollusk"* by Einstein. We may conceive that a large reference section or "Mollusk" shrivels or contracts into a small section or vice versa.

During such diminutions or augmentations the laws of the relational factors remain the same, and the resulting section is either a reduced or increased replica of the original. The changes are similar to the effect produced by looking at an original, first with a reducing glass, and then with a magnifying glass. All the parts of the co-ordinate fabric will remain in the same relative juxtaposition irrespective of the type of the glass through which it is observed.

In such a system force regarded as an independent entity does not exist. Action at a distance no longer becomes a problem because the world frame is a unitary interacting system.

Einstein holds that a further consequence of his worldsystem is the disappearance of the mass M (which pertains to a particular point) from the law of motion. He reduces the motion of a particle under the so-called influence of gravitation to a mere "Following" of a geodetic line in his four-dimensional world.

Nowhere has Einstein stated his own case as clearly as it has been presented in the above analysis, which is due to Reuterdahl. It is even doubtful if Einstein has grasped the significance of his own vague and stumbling attempts at formulating this great world synthesis. His pitiable inability to express the essentials of the system in a clear and intelligent manner can readily be accounted for on the supposition which grows upon us—that Einstein has taken his entire thought of this synthesis from the work of Reuterdahl.

Not grasping clearly the intent of Reuterdahl's Space-Time Potential, Einstein camouflaged it in a distorted manner into his own Space-Time Continuum—by transferring the conception from Euclidean to non-Euclidean. Reuterdahl's Space-Time Potential is a synthesis, not only of the same intent as Einstein's, but of a vastly more comprehensive order. Reuterdahl's complete cosmology proceeds direct from physical facts, whereas Einstein presents us with a skeleton, incapable of harmonious functioning, because it is constructed from the fibers of inconsistent mathematical speculation, which predict coming events with the hope that they will conform—and if they do not, they are quietly thrown out of court. Reuterdahl has distinctly stated, that force does not exist in the physical universe as an independent and distinct entity, and action-at-a-distance offers no obstacles, because the cosmos is an interacting unitary system. While Einstein numbers his various co-ordinate curves which constitute the fabric of his reference-mollusks, Reuterdahl also numbers his potential loci and shows carefully, that relative conditions existing between any two elements of a section, also pertain without change between the similarly numbered elements in any other section, irrespective of its size, and whether located in the realm of microcosm or that of macrocosm. His Space-Time Potential is a chart or diagram defining the motion of every activity center in the entire interacting system.

We realize the similarity of the two systems, the one complete and the other an incomplete instantaneous static view of the dynamics in the former.

Reuterdahl's priority is undisputed, the relative dates being nailed down chronologically. If the Space-Time Continuum is not a camouflaged edition of Space-Time Potential, it certainly looks like *another coincidence*.

Einstein's version suffers sorely when compared with the earlier synthesis of Reuterdahl. Einstein abandons the classical mechanics, while Reuterdahl adheres strictly to its experimentally demonstrated principles. Einstein resorts to non-Euclidean geometry for the fibers of his Space-Time Continuum, whereas Reuterdahl contents himself with observed physical data.

Comparing the Theories

IN PASSING from one geodetic line in Einstein's system to another, the measuring rod must undergo appropriate change in length. This purely hypothetical and experimentally unwarranted assumption is entirely absent in Reuterdahl's cosmology.

Einstein's cosmology contains no genuine *absolute principle* and leads to skepticism, while Reuterdahl in his theory, shows that the physical universe is inoperative and inexplicable without the *absolute being of God*.

The following parallel citations will show the clearly complete synthesis of Reuterdahl opposite the attempts of Einstein to cover the same ground by his non-Euclidean process.

REUTERDAHL:

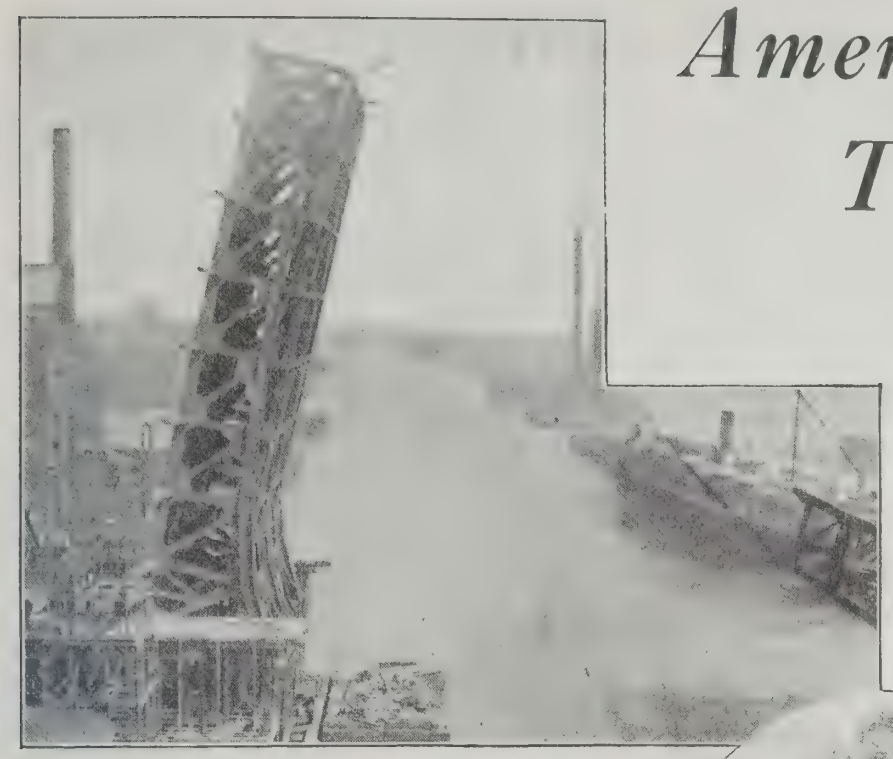
"The constant values which pertain to the interdependent physical magnitudes located within an area equal to one-ten-thousand-millionth of a square inch, exemplify the laws of the Space-Time Potential with the same invariable rigor as obtains in the case of interdependent physical magnitudes found within an area equal to ten thousand million square miles. This constitutes the complete relativity of physical action (kinetic or potential) to space and time."

(Scientific Theism vs. Materialism, The Space-Time Potential, page 10.)

"The laws by which we interpret the activities

(Concluded on page 14)

ARVID REUTERDAHL, dean of the department of engineering and architecture at the College of St. Thomas, St. Paul, Minnesota, since 1918, as far back as 1896, while a student at Brown University, Providence, Rhode Island, conceived the basic outline of his work, "Scientific Theism Versus Materialism, the Space-Time Potential." He has lectured extensively on engineering, scientific, mathematical and philosophical subjects, and has published a number of books on scientific subjects.



ARVID REUTERDAHL

When the trumpets of Einstein began to sound the blasts of glory for Relativity and its discoverer, the American scientists were swept off their feet because they were unfamiliar with these strange doctrines, but Dr. Reuterdahl had been thinking in "Space-Time" terms since 1896; in fact, he was the first to employ the hyphen between the two words, space and time, and his Space-Time Potential antedates Einstein's Space-Time Continuum. Professor Reuterdahl was the first in the United States to denounce Einsteinism as a fallacy.

Dean Reuterdahl was born February 15, 1876, at Karlstad, Sweden, the son of Jonas and Christina Reuterdahl. In 1882 the family came to the United States, eventually locating in Providence. The son's early education consisted in private instruction given by his father, a former officer in the Swedish army, and an excellent mathematician and philosopher.

America's Billion Dollar Three-Shell Game

By EDWARD JEROME DIES

It has been said that every time the Boulevard Link bridge opens its giant jaws some gentleman with real or figurative chin whiskers and a gripsack pays admission to the impressive sight.

SWINDLERS are ending the fattest period of their lives. In the wake of their efforts are skeleton mining shafts that rise like monuments to buried hopes. Empty factories, mere shells tacked together as evidence of future magical wealth. Stores, co-operative so-called, but dust-covered and moldy from lack of trade. Orchards of withered trees as barren as an iron pole.

Every conceivable commercial project has been foisted on an unwise public. And this public, like the idol worshipers of old, has heaped high the altar of the crusaders who exploit dry oil wells, blue print gold mines, horse meat packing plants and a thousand and one other visionary schemes.

A score or more bucket shops have failed already this year, due to a rising market in stocks, and millions of the public's money was lost. Bucket shops are supposed to be outlawed, but they manage to do business until the crash comes. They thrive on a declining market.

Worthless securities having an aggregate face value of a billion dollars have been scattered over the country in the last year. The estimate is based on reports of banks, bond houses, government bureaus and trade associations. The amount actually collected in the bonanza schemes is conservatively placed at a quarter of a billion dollars. Burglars and embezzlers were far less prosperous than their crafty brothers, the confidence men. Reports of 30 leading insurance companies show that in 12 months burglars and embezzlers separated the public from only $100,000,000. In so doing they risked death from the watchman's pistol or chanced long prison terms.

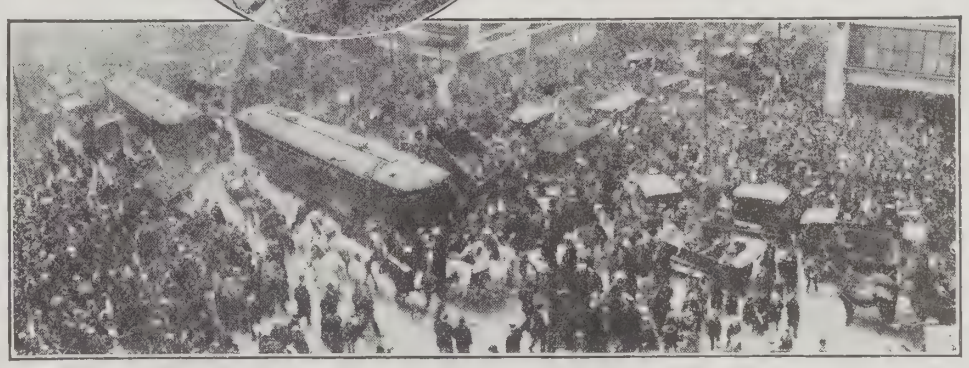
The "blue sky" gentlemen in most cases did neither. They hired brilliant legal talent and remained just within the law, or disposed of the worthless paper and skipped to new fields before the smash came. The James boys faced death for less than a hard-working promoter made in a single month.

Back in 1912 the government uncovered schemes which had picked the public's pocket of $77,000,000 in a short time. Authorities also terminated in the same year projects that had defrauded New York City of a billion dollars in seven years.

These government raids caused a mild flurry in Bunco Land. A lull followed; new laws were enacted here and there, and for a time investors regained faith in honest business institutions.

Then the war came on and with the phenomenal rise of securities, a fever of speculation broke out. Thousands who had never before chanced a nickel went money crazy. In the subsequent orgy of speculation, fortunes were made by people in all walks of life. Stories of newly acquired wealth spread like wildfire and the sums increased with the telling. Reckless speculation should have ended with the war. But the public had known the flush of surprise that comes of throwing "sevens" and "elevens" and wanted to continue the game. The public was ripe for a trimming and the "blue sky" operators were prepared. By the beginning of 1920 they were out in numbers and by 1921 they were going full speed ahead. Financial leaders declare that never before have so many purely fantastic notions been commercialized.

The crusaders first centered on the eastern and western coasts. Figuratively, they converged in the Central West, a fertile field, shook hands in high good humor and went on their happy ways. No city or hamlet escaped. Each dropped its handsome contribution into the hat, sometimes on recommendation of a local chamber of commerce, duped by the crafty Wallingfords.



"In the last two years," said a financier, "a forest has been reduced to paper for the printing of worthless securities. There seems to be an actual demand for them. Stop 10 men on the street and nine of them will chance their money on a wildcat rather than invest in sound securities with certain returns.

"An investment worthy of consideration is approved by public accountants, appraisal engineers, legal counsel and an expert financier. These inquiries, made at heavy cost, protect the investor. First-class banks and bond houses purchase securities with their own money and sell to investors at a slight increase. A market for resale also is provided.

"When the investor opens negotiations with a house that observes none of these precautions, he is flirting with financial disaster."

Through confidence games strips of invaluable park land have changed hands more often than a haunted house.

"Suckers? Why, an old-fashioned three-shell game at State and Madison streets would finance the Chicago Subway," said the head of an investigating agency.

But, adds this authority, the investor goes right on flirting. He stares dreamily at the beautiful prospectus, a siren that will become a toothless jade. He is entranced by the striking photographic views, and listens enthralled to the glowing reports of "our President, who is on the scene rushing construction work." When the salesman lowers his voice and says, "Next week the directors will advance the price 20 per cent over the present low price of five cents (par value $1)," the sucker feels on his shoulder the touch of the Goddess of Fortune.

Mails are being flooded with printed matter describing how fabulous fortunes may be quickly made. Here is a specific case that is typical. A Texas promoter has been conducting a drive to sell unit leases in a "1,000-acre potash lease syndicate."

The investor is promised 2,000 times the money invested!

This promoter claims that in drilling an oil well in Martin County, Texas, an enormous bed of potash has been discovered. "Our present information," he says, "indicates we will have an income for 100 years of more than $100,000 a day." Cost of a lease on one acre is $150. The lease owner gets 10 per cent royalty. The profit on each acre is figured to be $3,469,660, and the lease owner's return on his $150 is from $346,907 to $567,666, depending on whether the royalty is on the gross or the net.

The promoter reproduces an "interview" with D. D. Christner, co-operating chemist for the Bureau of Economic Geology and Technology of the University of Texas and the United States Geological Survey. Christner is made to say that the salts in certain counties named are more valuable than any others in the world.

The "interview" was published without Christner's knowledge, and a large part of it has been branded as false by the United States Geological Survey. The survey states that no authenticated discoveries of potash have been reported in Martin County. Potash has been found in some places, but under circumstances which make it impossible to state whether it exists in beds sufficiently deep to warrant development. Extent of the beds cannot be proved, says the Geological Survey, until wells have been drilled throughout the entire territory. Yet the promoter claims to have discovered a bed covering vast areas after drilling only one well.

So flagrant are the misstatements that the National Vigilance Committee of the Associated Advertising Clubs of the World is exposing the scheme. Meantime, the United States Geological Survey has sent out warnings against get-rich-quick potash operators.

Disposing of fake securities has become a fine art and an examination of methods is enlightening. Salesmen are carefully schooled and are compelled to repeat verbatim certain talks which, while sounding ridiculous to many, are strikingly effective when the law of averages is applied.

The salesman first refers at length to well-known projects that have enriched stockholders. He assails banks for low interest rates and declares the banker who pays the depositor three or four per cent usually makes from 50 to 100 per cent on the money. He soon destroys the victim's sense of values. He skillfully injects into the talk many impressive names, conveying the impression that these persons are financially interested. At the proper moment, according to the printed sales talks of these houses, he is to swing into dramatic art and register "enthusiasm, chagrin, amazement or anger, as the occasion suggests."

"Concentrate the prospect's attention," says one of these instruction books, which is typical. "Write as you talk. Mention that you understand the price will be doubled next week. Read very slowly paragraphs of prospectus indicated in red. Then continue as follows:

"Now, Mr. Brown, you have the proposition in a nutshell. If there are any questions, I'd be glad to answer them (while saying this, get your pen ready, as if you expected him to use it. Lay the application before him in a comfortable position to sign) and if there are no questions, I'd be glad to have your check. (Lay pen on blank ostensibly for him to use.)

"Successful men advise investment. Investment will make you a man of affairs. It will make you a force, not a mere drag. Men who are forceful are quick in decisions.

"Now, be honest with yourself, Mr. Brown." (Never let him get in a word until you have reached this point. If he should break in with an objection, ignore it and go on. When you are ready for his objection, let him speak).

"I must talk it over with my wife." (This is a frequent feeble alibi which must be met in this way.)

"Mr. Brown, your wife is not the one who must study this. She is not the one who must pay for it. All she can do is to tell you that it would be wonderfully good. (Here register sincere feeling.) But you know that yourself right now. Your trouble is not that you need advice, but that you need courage. This fear is the hallmark of the weak man.

"The strong man never fears, never doubts, never hesitates. As Emerson says, 'he not only leaves the many out of his calculations, but he also leaves out the few'. He is sufficient unto himself. He knows himself, knows what he wants and has the courage and initiative to go after it. If you want to be a strong man, act as a strong man acts. A man is but the personification of his habits. Make courageous acts a habit. If you wish to be strong, imitate the strong. Your acts will become habitual. Then you'll be one of the strong. Isn't that reasonable? (Yes). Right on that line, please."

In recent years co-operative enterprises have become almost a fad. Hundreds have gone to pieces. Sometimes these "cure-alls" die simply from stupidity but more often the hand of the professional promoter may be seen. Companies, associations, corporations and societies have been organized to cut down the grocery bill, increase prices to producers or correct some other evil, imaginary or real. Promoters juggle the funds and shift their activities to new states before the organization falls apart. Organizers of pseudo-co-operative groups never fail to shout the merits of the Rochdale plan, which has proved beneficial to consumers in England. The dupes sign contracts which, in effect, turn over their bank rolls to unscrupulous organizers with virtually no entanglements. The Rochdale principles and the "knock-down-and-drag-out" methods of the professionals are as different as night and day when the time for action arrives.

An Indian Chief's Version of Custer's Last Fight

Concluded from page 3

in "war" that they met their death. So the Indian had a "grudge" that, from his viewpoint, was entirely natural and fully justified. It was with this feeling of great personal injury and humiliation that he went into the Custer fight on that beautiful June day in 1876, and if we are to believe the statement of the white survivor quoted, he made good his threat at last.

But we are yet to hear from the old chief who knows most about it, the man who was the best friend of Rain-in-the-Face and who was with him in the fight and saw just what occurred there. It is the story of the victor and is told in the same manner and with the same indifference that the white man tells, in our history, of the fight at Washita. Flying Hawk was born in the Black Hills; it was his home that the whites had invaded; it was his gold they took in violation of law and sacred treaty; it was his buffaloes they slaughtered for amusement, so causing him to go hungry and cold. It was from him and his friends and relatives that they withheld food and blankets and money that was due them under their treaty, and grudgingly gave them "bones" and "rags" and "10 per cent" instead. It was his friend they had humiliated by arrest and imprisonment unjustly. All this was followed by a further series of abuses until there was a general uprising of all the Dakota and neighboring tribes in retaliation. Because they had begun to show this spirit of retaliation and had left the reservations, American troops were ordered to drive them back into the bondage they had deliberately, and as they considered, rightfully, abandoned.

It was in this "rounding up" operation that Custer met his fate. Justly or unjustly, it was war, and Custer was not inexperienced in Indian warfare. He closed a campaign against the Cheyennes in 1868 by the crushing victory of Washita, where 103 warriors were killed and the tribe forced to return to their reservation. Following this he fought a number of battles, and opened up the Black Hills country. Therefore, we may now draw a mental picture of the several Indian tribes consolidating in and about the junction of the Little Big Horn and the Big Horn rivers in various camps, while American soldiers are surrounding them to force their surrender or perhaps annihilate them. Custer rode out with his cavalry, intending to move around to the south and up the Rosebud, driving the Indians down the Little Big Horn *into the grip of the strong force* marching against them.

Now let us learn just what happened, according to this last surviving chief on the Indian side. He told it to me in a simple straightforward fashion without show of resentment. It must be remembered that this old chief does not speak English, nor is he able to write, and his story was translated and put down, exactly as he related it after several days of deliberation. Here is its substance:

"We started from Fort Robinson and traveled up into Montana. There we joined the Cheyennes and four companies of Sioux Indians. They were under four chiefs. We all camped on the Little Big Horn River, up the river from where the fight took place. Before this fight we had had a little fight with the United States soldiers and a few Crow Indians on Rosebud Creek; they killed three of our men and we killed nine of their men.

"We left them and went back to the village and broke camp and moved down to where the battle with Custer took place.

"It was a nice summer morning. Before noon, we saw a cloud of dust rising in the air up the river. A cry was raised that the soldiers were coming, and we all started for our horses. We caught them and mounted. About this time they were nearly on top of us, firing into the village. The women and children ran down the river.

"Every warrior was ready by this time so we charged the soldiers in the face of their bullets. We whipped them back into some holes they had dug. We killed many of that bunch. They were called the Reno company.

"Some of the Indians rode up to us and said Custer was coming up the river with his command, heading off the women and children. So we all charged down to where Custer was coming up. When we got close to Custer's command they dismounted and commenced firing on us, but we kept going for them. They saw that we would not stop, so they started to mount and retreat. But we were already among them, shooting them down with arrows, knocking them off with war clubs, pulling them off by hand. They must have been scared out of their wits, as they showed no fight after the first fire.

"After we got them on the run, we chased them about a mile till only a few were left. We ran those into the river. Many were drowned, the remainder we killed. We lost 30 killed in the battle.

"The next day scouts were sent out; they reported that General Miles was coming with his command. The chiefs said we would not fight Miles, as he had too many men. So we broke camp and got away from there."

As this statement contained no reference to mutilating the bodies of the dead soldiers, the chief was asked to speak on this point definitely. In a letter dated December 5, 1921, he says: "You ask me another question about the Custer fight: They did not cut out the heart from that soldier's body, just took off his clothes and we ran away. The big chief all dead. All the soldiers were killed in about one-half an hour."

The statement must stand or fall as it is believed or denied. It will be believed by some and it will be denied or ridiculed by others. That is to be expected. But where is the proof that it is not a truthful and accurate statement of the facts?

America's Billion Dollar Three-Shell Game

Concluded from page 13

Operations of swindlers have reached such proportions that they are reflecting upon legitimate business and the need of drastic action is recognized. Commercial organizations are trying to combat the evil. Legislatures will be urged to enact new "blue sky" laws or put teeth in existing statutes.

In the meantime, Illinois, a playground of dishonest promoters, is instituting a plan that will be closely watched by other states. A securities bureau is being established by the Illinois Chamber of Commerce. This bureau will be linked up with all local chambers of commerce in the state. When a stock-selling project is started in a community an immediate investigation will be made by the securities bureau, covering everything from the assets of the company to the business careers of its principals. Results will be submitted to chambers of commerce and to newspapers.

Outlying strips of the Chicago park system have changed hands more often than a haunted house. The plan is simple. The "jayhawk" is led about town by a chance acquaintance, who, at the proper time, turns out to be a real estate man.

"Now, here is some land," he says in a casual way, "that we are closing out. The last 20 acres go tomorrow.....A hundred dollars cash takes it....Now, you just hang on to that deed for a year or two."

This and other cheap tricks should have died with the barroom. Among these pastimes is the "Bridge of Si's" trick. It gained popularity with the completion of the Boulevard Link Bridge spanning the Chicago River. It is estimated that nearly every time the giant structure opens its jaws for a string of ships to pass, some gentleman with real or figurative chin whiskers and a gripsack pays admission to the impressive spectacle.

"Let a gambler set up an old-fashioned three-shell game at State and Madison, Chicago," said a well-known investigator. "Give him police protection. In two years he could finance the first five miles of the new Chicago subway.

"Is it any wonder that stock swindlers and bunco artists prosper? They merely satisfy a public demand."

When Snow Hit "Sunny California"

Persons in "Sunny California" were rudely shocked when a snowstorm descended upon them. But they quickly recovered, and hurried to take advantage of the novelty. The "snow line" descended to about 400 feet above sea level, throwing a blanket over much of the Coast Range. The populace soon moved almost en masse to the hills. Automobiles came into the business districts of Oakland heavily laden with snow, and snowballing was a popular diversion. The accompanying pictures were taken on "Skyline Boulevard," of Oakland.

Reuterdahl vs. Einstein: a Fallacy Hit

Concluded from page 12

time. The primary relativity concepts are built upon these three cosmic fundamentals." (page 88)

"The cosmos is a unitary interacting system in which the distance and duration are respectively the spatial and temporal indicators of the relative magnitude of the interaction between things." (page 91)

These lines indicate the completeness of the synthesis of Reuterdahl. Gravitational, electrical, thermodynamical and all forms of physical activities are comprehended under the single plan of his Space-Time Potential, every portion of which exemplifies the same fundamental properties (laws) as every other portion, whether in microcosm or in macrocosm. Any portion of Reuterdahl's Space-Time Potential *may be used as a reference section,* because every portion is equally representative of the interrelational background of the universe.

Einstein's construction of *reference sections,* which he calls *"mollusks,"* is as follows:

EINSTEIN (Relativity, Pages 103 and 104.)

"We imagine a system of arbitrary curves drawn on the surface of a table. These we designate as *u*-curves, and we indicate each by means of a number. . . . . We have then a system of *u*-curves, and this 'indefinitely dense' system covers the whole surface of the table. These *u*-curves must not intersect each other, and through each point of the table surface only one curve must pass. Thus a perfectly definite value of *u* belongs to every point of the surface of the marble slab. In like manner we also imagine a system of *v*-curves, they are provided with numbers in a corresponding manner, and they may likewise be of arbitrary shape. It follows that a value of *u* and a value of *v* belong to every point on the surface of the table. We call these two numbers the co-ordinates of the surfaces of the table (Gaussian co-ordinates).

"This non-rigid reference-body, which might appropriately be termed a *'reference-mollusk,'* is in the main equivalent to a Gaussian four-dimensional co-ordinate system chosen arbitrarily . . . . Every point on the mollusk is treated as a space-point, and every material point which is at rest *relatively to it is at rest,* as long as the mollusk is considered as reference-body.

"The general principle of relativity requires that all these mollusks can be used as *reference-bodies* with equal right and equal success in the formulation of the general laws of nature; the laws themselves must be quite independent of the choice of mollusk." (page 118)

Regarding fields of force and gravitational fields in Einstein's General Theory, his disciple, Eddington, says: "The track of a particle of matter is thus determined by interaction of the minute gravitational field, which surrounds and, as far as we know, constitutes it, with the general space-time of the region." (Space-Time and Gravitation, page 138.)

REUTERDAHL:

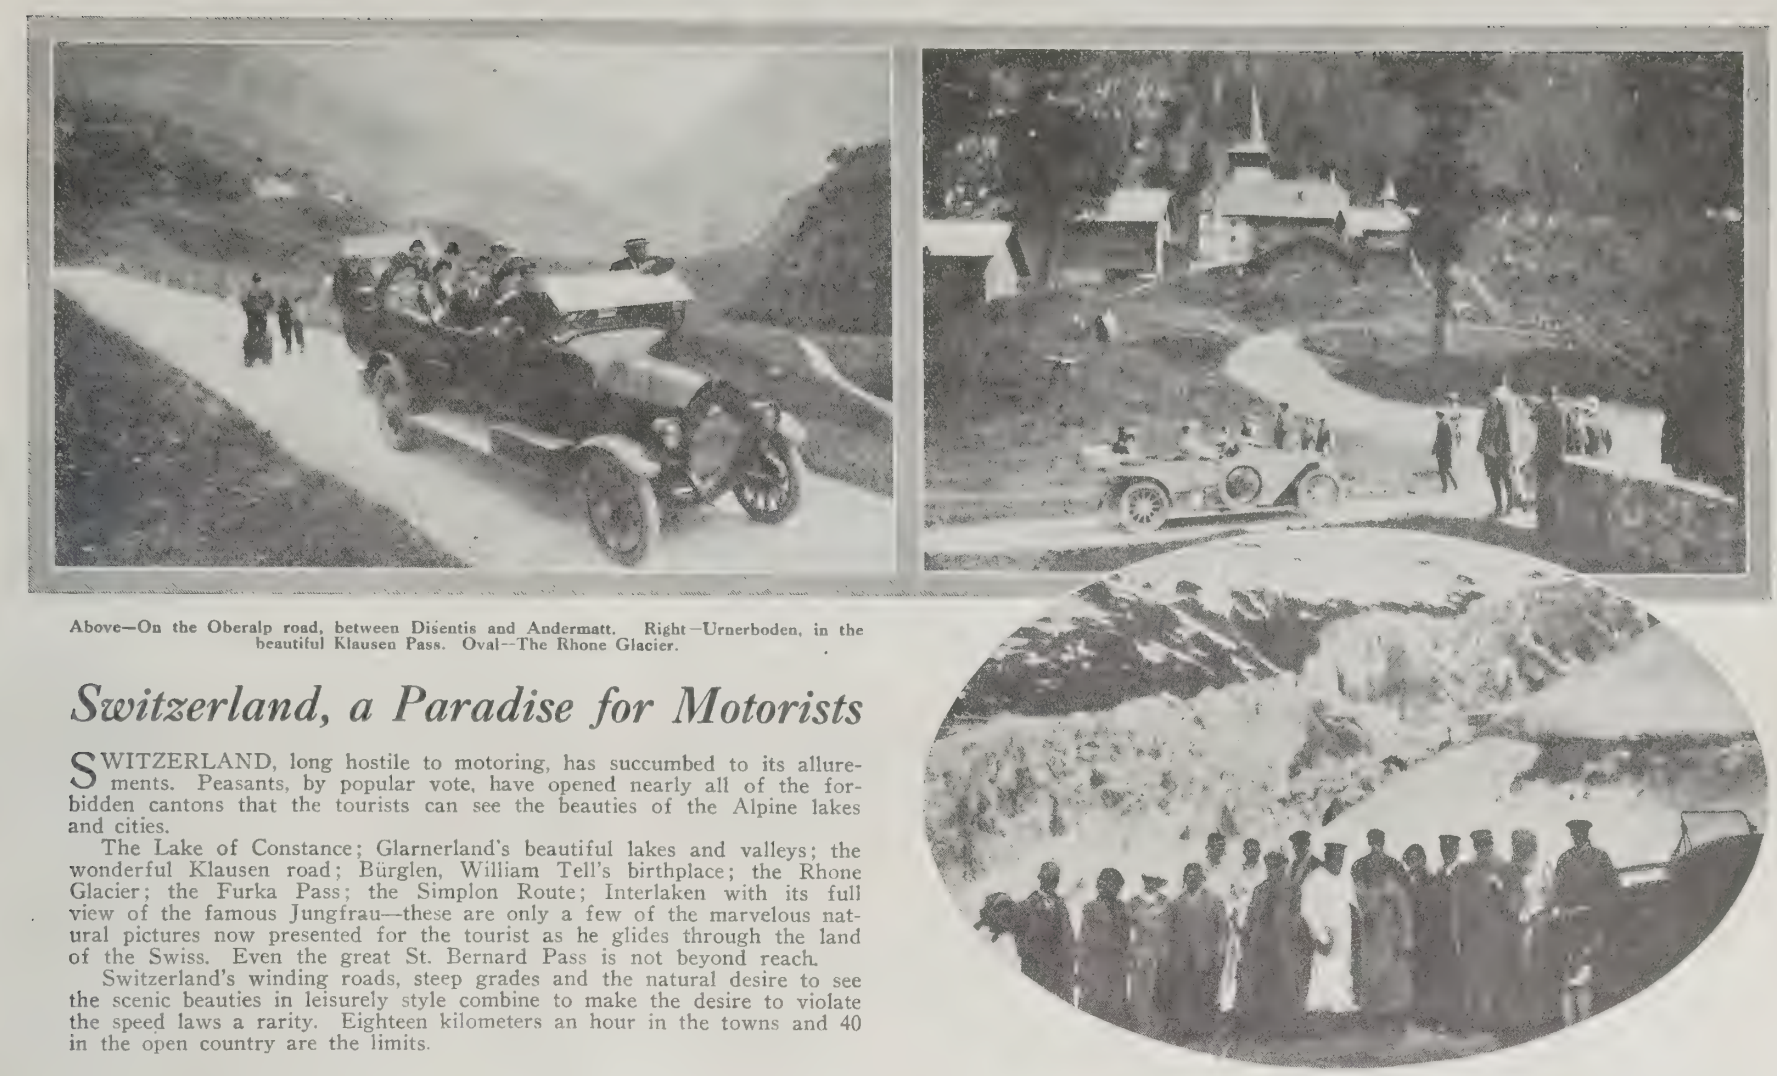
"Space may be considered as laminated in every direction with such fields (fields of gravitation). Empty space has no meaning from this point of view, for the reason that every surface in space is subjected to interaction, which results in giving to every one of its points a definite work or energy value. The motion of a particle within a given surface can be definitely predicted, if we have a prevision of the work value of the points in the surface." (Scientific Theism, page 124.)

The similarity in the contents of these last passages is *another coincidence.*

Moritz Schlick, another exponent of the Einstein theory of relativity, says in his "Space and Time":

"The Einstein law, which comprises both inertial and gravitational effects, asserts: The world-line of a material point is a *geodetic* line in the Space-Time Continuum."

These quotations show conclusively that Einstein employs his *reference mollusks* as a means of passing beyond the limitation of his Special Theory. His Space-Time Continuum has become a chart of possible and actual interaction, every point of which has a definite significance. Successive points constitute world-loci or lines which are the tracks along which material particles move. The relational factors hold in a microcosmic as well as in a macrocosmic portion of this world-chart.



We thus see the entire thought of Einstein's Space-Time Continuum contained in Reuterdahl's prior contribution, but the *Space-Time Potential* is *a far more comprehensive synthesis.* Reuterdahl, with the utmost vigor and consistency, applies his Space-Time Potential to the molding of the atomic structure.

A Space-Time Potential Zone System is shown on page 245 of Reuterdahl's work. This zone system is far more complete than anything attempted by Einstein.

Reuterdahl has shown that one is enabled by his Space-Time Potential to calculate the dimensions, velocities, accelerations and orbits of subatomic particles, atoms, molecules and planets. Reuterdahl abandoned the old ether hypothesis back in 1902, and has given us in its place a medium of neutral primordial matter, which is so closely interwoven with the fabric of his Space-Time Potential, that these three basic elements of reality interact in perfect harmony.

Einstein, after discarding the old ether hypothesis, has failed to provide a substitute. That he now realizes how seriously this omission threatens the foundations of his theory is clearly evident from his apologetic lecture at Leiden, May 5, 1920.

Reuterdahl completes his cosmology by showing the impotency of every system of relativity which attempts truthfully to represent the cosmos without including a genuine Absolute Principle. His complete system of relativity is the greatest proof yet advanced for the existence of God. Einstein may be able to avoid the condemnation of the just by the plea of *"coincidence,"* but he can never remove the seal of priority which will remain through the ages upon the work of Reuterdahl.

Above—On the Oberalp road, between Disentis and Andermatt. Right—Urnerboden, in the beautiful Klausen Pass. Oval—The Rhone Glacier.

Switzerland, a Paradise for Motorists

SWITZERLAND, long hostile to motoring, has succumbed to its allurements. Peasants, by popular vote, have opened nearly all of the forbidden cantons that the tourists can see the beauties of the Alpine lakes and cities.

The Lake of Constance; Glarnerland's beautiful lakes and valleys; the wonderful Klausen road; Bürglen, William Tell's birthplace; the Rhone Glacier; the Furka Pass; the Simplon Route; Interlaken with its full view of the famous Jungfrau—these are only a few of the marvelous natural pictures now presented for the tourist as he glides through the land of the Swiss. Even the great St. Bernard Pass is not beyond reach.

Switzerland's winding roads, steep grades and the natural desire to see the scenic beauties in leisurely style combine to make the desire to violate the speed laws a rarity. Eighteen kilometers an hour in the towns and 40 in the open country are the limits.

Steamship Monopoly Stifles Alaskan Trade

Concluded from page 11

eral different items of general merchandise freight that were shipped from San Francisco, via Seattle, to Alaskan ports. The figures were taken from actual freight bills sent by persons who paid the freight charges. Those bills show the actual charges made for transit to Seattle and from Seattle.

The largest tabulation has to do with freight whose destination was Ketchikan, the first port of call in Alaska. It is 742 miles from Seattle, or 198 miles shorter than the run from San Francisco to Seattle. The total of all the freight bills covering shipment to Seattle from San Francisco called for payments aggregating $145.29; those covering shipment from Seattle to Ketchikan—of the same articles—called for payments aggregating $197.33.

"The actual cost of transportation of freight from Seattle to Ketchikan," Mr. Sutherland declared, "not including the wharfage charges at Seattle, is 36 per cent greater than the charges from San Francisco to Seattle, a distance 200 miles greater."

He called attention to charges for an actual shipment of sugar. The tariff sheets show that the rate for sugar in less than carload lots is $12 from San Francisco to Seattle, but only $9 from Seattle to Juneau. But a man at Ketchikan, which is nearer Seattle than Juneau, paid, according to Mr. Sutherland, $96.96 freight on a shipment of sugar from San Francisco to Seattle, and $129.28 for the same shipment from Seattle to Ketchikan.

He presented figures taken from actual freight bills showing like excess charges for freight shipments to Wrangell and Skagway. A highly interesting exhibit in his address is a quotation from a letter written him by "one of Juneau's leading citizens" in reply to a request for like information as to charges paid at that Alaskan port. It follows:

> The shippers are a little reluctant to give out information of this nature without knowing the purpose of the request, thinking it might prejudice the transportation companies against them if their action became known.

"And thus, through fear of a monopoly," Mr. Sutherland declared, "the public is prevented knowing how much is contributed in the increased prices paid for food and other necessities imported into the territory."

He declared that excessive rates are maintained by the two companies which "for years controlled the water transportation from Seattle to Alaska. There is no evidence of joint ownership or interlocking directorates in the published reports of the two organizations, but their harmonious work in extorting exorbitant freight rates from Alaskan shippers for these many years would indicate that a common financial interest exists somewhere, and nothing serves to illustrate their common interest in throttling Alaskan industry as does the co-operative and combined work of their Washington lobby, whose activities are paid for indirectly by the Alaskan shipper. 'The small competing lines have been eliminated,' says Governor Riggs, and he, as well as the people of Alaska, know that they were eliminated by co-operative action on the part of the major companies.

"There is but one copper mine operating in Alaska today outside of those operated by the interests which control the steamship monopoly and the Tacoma smelter, of the American Smelting & Refining Company, at Tacoma, Washington. Many copper properties on the coast of Alaska are closed down because of the exorbitant smelter charges and freight rates."

Mr. Sutherland also charged that a lobby serving the interests of those who control Alaskan shipping operates regularly in Washington and works to defeat any move toward correcting the evils of which he complained.

Virtually all consideration of measures for Alaskan relief have been suspended for the time being, probably because of President Harding's desire to visit the territory and look into the problem at first hand. This he may do during the summer.

Marooned on a Gold Reef—the Fate of the U. S.

Concluded from page 8

the other, render its readjustment inadvisable if not impossible.

If, as may be possible, the pound sterling reaches par of exchange in the near future, the last vestige of American financial supremacy will be lost. A par pound sterling will mean the early liquidation of the British debt, and no sooner will that take place than the United States will be unable to influence European monetary values, except through the pound sterling. The economists who do not know what this will spell had better go back to grammar school.

The war has taught European nations—victors and vanquished—that the gold standard is the last survivor among many nostrums, and continental reconstruction might mean a readjusted standard. Certainly it is not conceivable that Europe, England excepted, can return to the gold standard of yore, since buying back the gold in America at the present price is out of the question.

Europe's reconstruction has been retarded of late mainly because it has been attempted to obey the gold standard with a paper standard, which is comparable to the American saying of "champagne thirst on a beer income." However, it is just as well that Europe has tried the experiment and proved it to be anything but practical. Of course, an arbitrary and exaggerated paper standard can be no whit better than its gold model, but it begins to look as if the doctrines of Quesnay, which emphasize the powers of nature as the source of public wealth and national prosperity (and the only proper source of public revenue) may come to the fore sooner or later. Certainly it does not seem logical that countries without auriferous deposits must accept gold as a standard in preference to even more valuable natural wealth.

A genuine, modern, efficient money standard will mean, of course, the elimination of foreign exchange as a principal vehicle of speculators. It will do away with the necessity, so often apparent now, of having to pay tribute to every middleman who handles international transactions. It will give an American producer and a foreign consumer, or vice versa, a full value for their investment. It will mean, which is more important, a commodity value rather than a gold value.

As things stand now, and as they will continue to be as long as the present unsatisfactory state of affairs continues, a very important part of business will not be done. Foreigners are waiting for cheaper dollar exchange; Americans are waiting for depreciated foreign currencies. The latter by recent habit and the former by necessity are looking at each other through golden glasses.

Midas was a tyro compared to the United States today. Coal, leather, lumber, foodstuffs, cotton, wool, to mention a few elemental products, have to be measured in terms of gold both by seller and purchaser under existing conditions, although it does not mean that the American producer is the sole gainer of what the European loses—but a huge, almost incalculable part is sidetracked to the pockets of the gold barons, of which there are too many.

It is alleged, naturally, that the American workingman is a gold-standard man; that he owes his standing to the high value of the dollar; that his usufruct is gold or its equivalent. That may be so, although that does not cut any ice with the unemployed American—and his name is legion—who has no gold money or any other kind of money, tin, leather or lead, and is at the same time of little consolation to the cotton farmer who could trade his crop, on a commodity-to-commodity basis, for something else.

Unless the insistent anti-gold standard movement in Europe is headed off, something is going to happen here.

Of course it would happen to the bankers, but they in turn would pass it along to the rank and file of capital and business and labor. But the shock can be prevented by the American Government, which should arrange to fix an exchange rate for every currency (in the case of the major powers to be set at the post-armistice ratio for the settling of all foreign debts incurred at the above rate). The new rate would not have to be perpetual, but every three or six months—six months preferably—reaffirmed or changed to meet conditions here or abroad.

Official adjudication of foreign exchanges, by simultaneous posting at every capital, would do away automatically with the foreign exchange speculators, whose only outlet would be to trade upon the next semi-annual rate, a rather lengthy period apt to break them of their habit. Moreover, *official* exchange rates would inspire confidence in everybody, inasmuch as it would remove all suspicion of private manipulation—a fear that influences many business men.

The suggestion is simple. That it could be carried out successfully if statesmen really wanted to succeed in the matter is not doubted in the least, and there is ample precedent for the step. But as to whether they will feel free or courageous enough to do it, against the opposition of the American Bankers' Association, is another story.

BRIEFLY TOLD

Roscoe Conkling Simmons, a nephew of Booker T. Washington, claimed in an address: "We have a record to defend, but no treason, thank God, to atone or explain. While in chains we fought to free the white men—from Lexington to Carrizal—and returned again to our chains. No Negro has ever insulted the flag, no Negro ever struck down a President of the United States, no Negro ever sold a military map or a secret to a foreign government, no Negro ever ran under fire or lost an opportunity to serve, to fight, to bleed, to die in the Republic's cause."

Jefferson Davis Cohn, godson of Jefferson Davis, bought the pawned pearl necklace of Maria Theresa, Queen of Hungary.

"Respect for law is of more value than respect for the violator," is the motto of the Rev. Mr. J. H. Williamson, new law enforcement officer of Chicago.

Norwich, England, is famous for its canaries. They came to Norwich with the weavers of Flanders, banished from their homes by the Spaniards, and ever since, the people of that city have been canary lovers and fanciers, almost to a man.

All pilots on transcontinental mail airplanes in the United States are to be furnished with side arms.

The American Bible Society, after more than 100 years of publishing the Bible, has announced it will soon close down its plant in New York City because of the high cost of production.

The Alaska Agricultural College and School of Mines, at Fairbanks, Alaska, will be the world's farthest north university. It will be within 100 miles of the Arctic Circle. It will open its doors next September.

The undergraduate in college now is better than was the student of a quarter of a century ago, according to the dean of Brown University. The new man is more amenable to discipline; has a keener interest in education; has a larger capacity for work and a higher sense of integrity. The dean says in 30 years he has met but two students who were liars.

More is paid for a mutton chop in New York hotels than for a sheep in Colorado, according to reliable reports.

A registered letter from Russia recently arrived in Newark with 500 or more stamps attached to the back of the envelope by metal fasteners. The stamps exceeded $1,000 in value at the normal rate of exchange.

"Jewish Influence on American Life," Volume III in the series on "The International Jew," comprises a third selection of articles on the Jewish Question, and is now off the press. It contains 256 pages, and will be sent for the cost of printing and mailing, which is 25 cents.

"The International Jew," Volume I, and "Jewish Activities in the United States," Volume II, 235 and 256 pages, sent for 25 cents each.

An airplane compass, believed to be the first completely satisfactory type, has been invented by experts of the Bureau of Standards. The idea of the revolving coiled wire is used instead of the magnetic needle. The compass responds instantly to the quick turns or evolutions of an airplane.

Engineering and carpentry will be taught the natives of New Guinea soon. The New Guinea Central Labor administration plans to equip the islands with skilled native labor and eventually hopes to train the natives in every trade.

Ninety-eight per cent of the land in Alaska is national property.

Luther Burbank's latest addition to the plant world is a new blackberry known as the "thornless blackberry." The cane has no thorns and the fruit is larger and more delicious than the ordinary blackberry.

Telephone-telegrams are sent in Berlin. The message is given to the operator, who gives it to an operator at the other end who communicates with the addressee, obtains a reply and telephones it back.

The public highways of the largest national parks are given over to monopolized transportation, according to reports. In Yellowstone National Park, it is said, the traveler in an automobile pays $7.50 toll and still does not have the road rights while on the road. The traveler cannot start early, but must wait until the monopoly cars have started. The traveler must not pass a monopoly car and must give it the right of way at all times. It is believed that this practice discourages travel to a great extent.

Three annual prizes, the highest of which is $2,500, are to be offered by the province of Quebec for works of literary merit.

The cow and the hen, always dependable stand-bys of our agriculture, have demonstrated their worth as reliable sources of income during periods of depression and returned good profits, according to the secretary of the Kansas state board of agriculture.

A beaver colony on the east fork of the Hood River in Oregon recently felled a tree 18 inches in diameter across a power line of the Pacific Power & Light Company, plunging the entire countryside into darkness.

Extensive remains of what apparently was once a Roman city have been discovered near Bantibanez, Spain. Traces of a highway have come to light and cisterns, with copper piping, have been found, as well as fragments of ceramics, gold coins, vases filled with ashes and numerous other articles.

M. Tardieu is an assistant editor on the *Echo National,* a new daily paper started by Georges Clemenceau.

Many thousands of clams were killed along the famous Pismo Beach in Southern California, by the cold weather recently, according to the fish and game commissioner of San Luis Obispo. Thousands of pelicans and sea birds swarmed the beach, feasting on the clams.

The "talking movie" has been developed in Japan, in that the part of every player in a screen play is taken by actors, placed in boxes on either side of the screen. These actors speak the parts of the characters as they would on the legitimate stage.

The "superphone" is a new invention which is said to assure absolute secrecy of communication and security from interruptions. One telephone line to which "superphones" are attached can be used for a number of conversations simultaneously and no pair of speakers can hear or interrupt another pair.

Nearly one-fourth of the land in Scotland has changed hands since the armistice, due to the changes in the owners' financial position brought about by the war.

The "grape cure" attracts many invalids to the vineyards of the Tuscany district of Italy. The day begins at 7 o'clock, with a breakfast of wholesome food and with grapes on which the dew is clinging. Grapes are served with each meal and the diet is carefully planned. The guests wander through the vineyards, eating the grapes and breathing deeply the sweet aromatic air. Plenty of exercise is essential to the "cure." Most of the invalids leave at the end of the vine harvest in robust health.

Bootlegging In Humans

"Till They Sweat Blood!"

The Real Negro Problem

Chronicler of the Neglected Truth

Bootlegging in Humans Across Our Borders

Closing of Ocean Ports to Undesirables Brings About Evasions

ELLIS ISLAND officials sum up the first eight months under the Dillingham three per cent immigration law as follows:

Aliens admitted, desirable stocks: 28 per cent of legal quotas.

Aliens admitted, undesirable stocks: 102 per cent of legal quotas.

With four months remaining, the United Kingdom, the stock of which furnished the North American settlers during the seventeenth and eighteenth centuries, had furnished less than 30,000 of its authorized quota of 77,206 immigrants. The Anglo-Saxon is not swarming to the United States.

Germany, whose sturdy emigration following the Revolution of 1848 gave strength to the development of the Middle West, was represented by about 13,000, less than one-fifth of its authorized quota of 68,039.

The Scandinavian countries, emigration from which a generation ago gave stalwart citizenry to Northern Michigan, Wisconsin, Minnesota and the Dakotas, have furnished only a few more than their quotas which total 40,000.

But there are dark contrasts to this modest migration of northern European stocks, whose easy assimilability kept immigration from being a problem for two and one-half centuries. These contrasts come in the excessive immigration of the very type the Dillingham law was framed to minimize.

Countries whose nationals have not only exhausted but have exceeded the quotas under the Dillingham law include practically every southern European country and the one northern European country of Poland. In justice to the Poles, it should be said that genuine Polish immigration does not differ measurely from that of the Teutonic, Anglo-Saxon and Scandinavian countries. Practically the entire emigration from Poland was Jewish. A parallel condition existed in Rumania, the government of which granted passports together with warnings that the emigrants would not be permitted to return if the United States did not suit them.

Other countries whose quotas were exceeded in the first eight months of the operation of the law include: Bulgaria, Greece, Jugo-Slavia, Portugal, Spain, Palestine, Syria and Turkey. Armenia was within a few dozen of its quota.

It may seem odd, but Palestine, smallest of the countries, is the land which furnishes the largest proportion of immigrants, figured on the law's percentages. Department of Labor reports on February 15 showed that Palestine had already got 370 per cent of her authorized quota past the Ellis Island gates.

Quantity Smaller, Quality Unchanged

CLOSE observers at Ellis Island say that the three per cent law has had the effect of reducing somewhat the *quantity* of immigration. But it has failed as a test of the *quality* of the aliens. Several defects in the law, some of them fundamental, have been discovered.

The most obvious of these, though probably not the most perilous, lies in the fact that the hard and fast percentages fixed by congressional enactment have not been obeyed. Americans, however, during these last few years of prohibition violations and tax law evasions, have been sadly disillusioned of the idea that the existence of a law implies its strict observance. In connection with alien restriction, it is no surprise to learn that approximately 2,500 exceptions have occurred.

Exceptions are inevitable as long as the human element and the political element remain in government. The human element is not proof against the sympathetic pull on the heartstrings. The political element is not proof against the insidious devices of those alien elements which constantly seek special privileges. An immigration official has said that there has never been a case at Ellis Island which did not possess its sympathetic side. The tearfulness of mothers exists with compelling sadness in the case of the dangerous criminal and the hopeless criminal. It is little wonder that the legal possibilities are stretched to the utmost on behalf of these cases. The unfortunate fact is that sympathy allowed sway in favor of the undesirable individual undermines the policy of the country as a whole.

In some measure, however, the first year's evasions of the law may be excused. An example is that of a family from Persia who arrived in San Francisco several months after the law had become effective. They had left their homes before the three per cent law was proposed, had traveled by caravan and on foot across Asia, and finally by slow steamships reached this country, where they intended to seek a livelihood by farming. They were without sufficient money to return to Persia. When they arrived, the small Persian quota was already exhausted. The Department of Labor, after determining that they were of industrious type unlikely to become public charges, wisely permitted their entrance.

Another example, somewhat more questionable, was resolved in the favor of immigrants, when a number of Armenian aliens arrived seeking entrance as Turks. The Turkish quota—used up incidentally largely by Armenians—was gone, so the aliens were admitted as nationals of that particular territory now known as Armenia, though they hailed from Turkey in Europe.

James J. Davis, Secretary of Labor, at Christmas time released on bond over a thousand aliens who had arrived in excess of quotas for their countries. Some of the more hopeless of the Ellis Island officials have come to refer to the island as Bond Island, because of the number of inadmissible aliens who have been granted entrance to the United States on the filing of a bond. Seldom, indeed, does one of these immigrants suffer deportation at the expiration of the period named in the bond.

Some of the excesses over the quotas have been due to doubt as to the method of figuring the allowance for each national or to other questions of interpretation of the law. Such troubles are always incident to the enforcement of a new law and may be excused.

Another defect in the three per cent immigration law as it was originally enacted and recommended for renewal by the House of Representatives affords a great injustice to immigration department employes. It is responsible, too, for the racing by steamship companies to get their passengers into New York Harbor first. This defect is the failure to prescribe monthly quota, so determined as to prevent the great jam in the first months of the fiscal year, and almost complete idleness toward its close.

During the first five months of the operation of the Dillingham law, the rush of immigrants to get in the United States first practically exhausted the permissible immigration from such nationalities as were eager

(C) U. & U.

REPRESENTATIVE ALBERT JOHNSON,
Chairman House Committee on Immigration

for American privileges. Necessarily, the examination of the newly arrived immigrants was too hasty. But more unfortunate was the fact that it gave the Federal Government on the first of March an opportunity to put into practice a particularly costly piece of economy.

The Department of Labor, doubtless egged on by the scrimping of parsimonious Congressmen, caused furloughs without pay to be given a number of veteran immigration employes. Subordinates in government employ have been notably ill-paid for years. The majority of such employes are scarcely able to make their stipends constitute a living. A few weeks without pay is almost a tragedy. It is obvious that a government service with poor pay, and the hazard of weeks of idleness, is not attractive, and that the immigration employes furloughed will be on the lookout for other work. Once before, the grant by the government of furloughs without pay, resulted in the loss to the service of many valued men. There is no government service in which experience and training plays a more important part than in the dealing with aliens.

Remedies for Law's Flaws

ELLIS Island officials suggested that the renewal of the Dillingham law be made with an amendment, providing equal monthly quotas for the first 10 months, with the remaining two months to pick up the loose ends. Such an amendment would enable a slight reduction in the immigration force but would make it a year-round staff.

The provision in the Dillingham law permitting aliens to enter the United States after one year's residence in Canada, Mexico or other contiguous territory has occasioned much alarm among persons interested in conserving American citizenship. Secretary Davis felt so strongly on the matter that he went before the House Committee on Immigration during its hearings and denounced the situation which permitted what he denominated "bootlegging of aliens."

Representative Albert Johnson, chairman of the House Committee, believes that the extent of the evasion of American immigration restrictions through the crowding of aliens into contiguous North American countries has been exaggerated. He says, however, that the one-year proviso is a flaw. Members of the committee expect to correct this defect in the revised immigration code and permanent immigration bill, now almost ready for introduction into Congress.

This code and bill will be one of the most important pieces of legislation in a century. There is danger that the force of public opinion may not be exerted sufficiently to compel its speedy enactment. Real American public opinion is difficult to arouse and easy to lull into inaction. But it was sufficiently aroused a year ago to compel the enactment of some sort of an immigration law. The alien influences which for more than a score of years had contemptuously resisted and killed practically all restrictive legislation were easily overcome, and forced to rely on hamstringing the law rather than defeating it.

The enactment of the Dillingham law was due to the power of an aroused public. In all justice it must be said that, despite defects, the law has done immeasurable good. The danger is that the public will rest on its laurels and forget that the lessening of the current of undesirables is not enough. Alien elements whose presence will poison still further the entire American system, will seep in more slowly under the three per cent law but they will get into the country just the same. The progress of the disease may be slower but it will be none the less fatal.

The vital defect in the present immigration law is lack of a test of quality, with a provision permitting the exclusion of undesirable elements, solely because of their undesirability—a filtration of the immigrant stream.

It is a difficult task, facing great obstacles in law and diplomatic relations with other nations.

Nearly every member of Congress and all immigration officials have come to the realization that the alien problem in America is one of race and of race alone. But it is accepted that there can be no exclusion enacted into law with the mention of a race.

One of the saddest bits of humor in all the solemn majesty of American law is that embodied in the Chinese Exclusion Act and in the general belief in illegality of excluding any more assertive race. We see no incongruity in denying Chinese laborers entrance at a time when American labor cannot stand their competition. But who would dare to demand exclusion of Frenchmen if French chefs were threatening the existence of the American cooks, of Italians if Italian fruit-stand men threatened the American grocer, of English coal miners if the American miner was in danger, of Jews if the "American" pawnbrokers were having hard sledding!

Obstacles to Testing Aliens

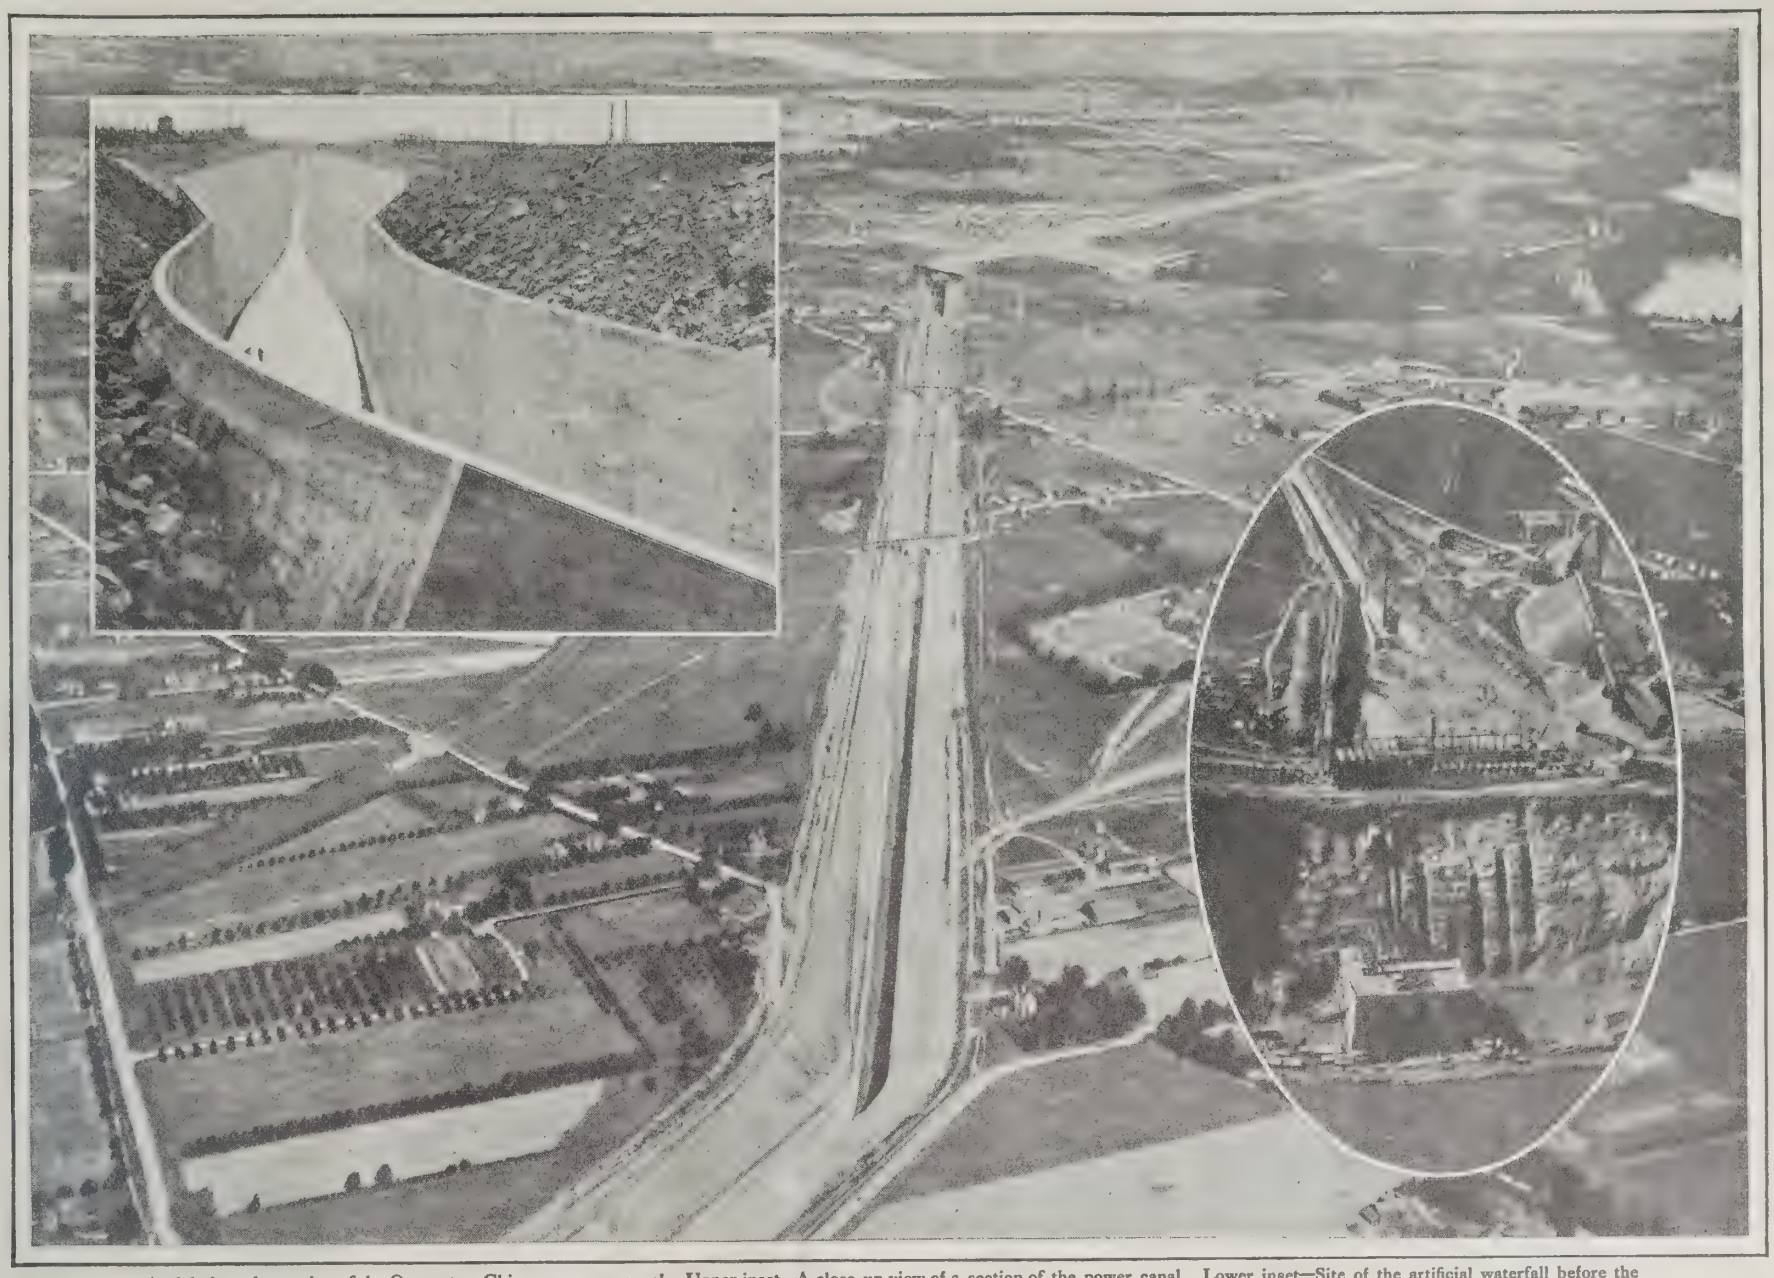
INCONGRUOUS or not, it is accepted in American law that there can be no racial discrimination in legislation. Therefore, as much as possible of the racial restriction must be attained in another way.

Congressman Johnson set forth for THE DEARBORN INDEPENDENT some of the problems faced by his committee when it took up the preparation of an immigration code.

"There have been 10,000 suggestions for laws to meet the immigration crisis," he said. "All of them have the essence of a good idea. But none is puncture proof. There are insurmountable obstacles in the way of nearly every one.

"There has been much support for the idea of complete suspension of immigration. But it stands to reason that complete suspension is impossible, and nobody seriously desires it. Our tourists go to other countries; we must allow their tourists to come to ours; treaty rights, in fact, make it imperative. Then, too, our citizens have business in other countries which takes them weeks, sometimes months and years. We must give reciprocal privileges to the nationals of other countries. Then there comes the question of students, of artists, of scientists and scores of other classifications, each only slightly worthy of consideration than the one previous, but all uniting to make impossible the idea of complete suspension."

Mr. Johnson, in common with nearly all the experts on immigration, agrees that the undesirable aliens should be prevented from sailing, rather than deported after arrival.



"But," he said, "the halting of an immigrant at the point of embarkation is a delicate problem. All governments are jealous of their prerogatives. European governments would be reluctant, to say the least, to permit us to establish inspection stations and espionage bureaus in Europe to test an immigrant's qualifications."

Delicate diplomatic problems are things Congress does not like to trifle with. As a matter of fact, however, it is probable European governments would exercise their common sense in consideration of the relations with American alien laws. In fact, the Italian Government after enactment of the Dillingham law took steps to prevent its nationals in excess of the quota requirements from sailing for this country. It is probable that, except for such European governments as have an undesirable populace they are desirous of getting rid of, there would be no diplomatic difficulty over any sensible provision for examining immigrants' qualifications at the point of embarkation.

It is probable, however, that the permanent immigration law when enacted will provide impliedly for qualitative restriction of aliens through regulations on viséing passports.

The United States consul in the chief city of a country will doubtless be charged with the duty of

Saturating a Commonwealth With Electricity

Niagara Made Twice as Mighty by Highly Kilowatted Citizens of Ontario

NATURE and man joined forces years ago to make the province of Ontario, Canada, the world's most highly electrified commonwealth. The effort was successful. But the residents of Ontario were not content. They took thought and then took action.

Their achievement has just become a fact. It consists merely in making Niagara Falls, the mightiest of Nature's vast possessions, twice as mighty as it was before.

Nature gave to the province of Ontario a half interest in this great industrial potentiality. Far-seeing, energetic Canadians seized upon it for development.

The result has been the literal electrification of the province. It is a province peopled, by the way, with residents of the same stock and habit of life as is Kansas, Nebraska, Indiana, Western New York, or any other rural community in the United States which has not been inundated by the immigrant swarms of recent years.

But while agricultural sections of the United States still live in the dim flickerings of the kerosene lamp age, Ontario from end to end, in farm and city alike, is agleam with electricity.

Better than one family of every three in Ontario uses electricity. One of every 10 persons in the province is a paying consumer of electricity furnished by the Hydro-Electric Power Commission. Eleven complete power systems are operated by the public alone. Electrically speaking, the Ontario kilowatt per capita is the highest in the world.

People have long since given up the attempt to marvel at developments of science and invention. Once upon a time, long ago, there was interval enough between the inventions of the printing press, the steam engine, the telegraph, the telephone and the sewing machine, for the human race to pause, to wonder, to gasp, to applaud, and even to build monuments to the persons credited with the great accomplishments. But during these recent decades, inventions and scientific achievements, automatons which do in an hour or so man's lifelong work, have appeared too frequently for man to do more than inquire the price. The ramifications of electric possibilities have become too many for consideration.

In Ontario, on a vast scale, electricity operates railroads; it also churns, bakes and does the family washing for Mrs. Hiram Smith, of Tilsonburg. Huge factories, employing thousands of men, owe their existence to the utilization of the water power; besides, Farmer Henry Jones, at Brownsville, saves time to cultivate his corn because electricity fills his silos and milks his cows.

But it is not in the variety of ways in which the power may be made useful that the average observer obtains his idea of electricity. Rather, it is the evidence which forces itself upon the senses. Therefore, it is Ontario as a well-lighted commonwealth that appeals to public imagination.

Ride through the province at night, on the train or over automobile roads, and your thoughts must dwell upon lighting. Everywhere the conviction is impelling that the province is years ahead of the rest of the world in development of its power possibilities. Little hamlets, which in another territory would be dark, are as well lighted as some of the great American cities. Street lights every 100 or 200 feet are not unusual.

Ontario is almost devoid of coal supply. That fact was largely instrumental in giving impetus to the movement for development of the water power, abundantly available in the great waterfall of Niagara. It is true that early development on the American side of the Falls was great. But the coal supply from the Pennsylvania fields was easy of access, and the need for water power was, therefore, not so pressing. The American development, too, met the usual handicap of excessive financial exploitation. A New York state legislative committee as late as 1918 reported that there was a generating company, a transmitting company and a distributing company, all with interlocking directorates, so that the ultimate consumer was compelled to pay dividends into three pockets. Naturally, the price of electricity to him could not be extraordinarily cheap.

Power development in Ontario was partially under private ownership and partially under public ownership, but the World War threw it practically all under government control. It has been under government control that the Queenston-Chippawa development has been carried out.

Canada is heavily endowed with water power, and Ontario is the richest province of all. It has been estimated that the total water powers of the world available for use approximate one hundred million horse power, of which only seventeen millions have been developed. Canada's share of the world's grand total is about twenty million horse power, one-fifth of the whole. Quebec and Ontario divide about twelve millions between them.

Development of water power on both American and Canadian sides of Niagara began during the last century. As early as 1853 an American corporation was formed with the design of building a canal and cutting shafts to permit the greatest possible use of power on water wheels. In 1883 the water power was first converted into electrical energy. Twelve years later advances in electrical science and improved turbines permitted for the first time the use of the full head of 210 feet from the top of the cliff at Niagara to the river below the Falls. Electricity had been used as motive power for street railways in Toronto in 1883. Five years later the first transmission of electric energy by water power in Canada occurred at Georgetown, Ontario, when 100 horse power was utilized in a paper mill.

Forty-three years of tremendously accelerating progress were punctuated by marvelous strides in electrical utilization, until the formal opening of the Queenston-Chippawa power development canal on December 28, 1921, a date which historians may be able to use in marking the passing of water-power development from the stage of haphazard individual effort to wholesale peak production.

Electricity saw the notable achievement of the installation in 1900 of a 200 horse power dynamo at Niagara, and only a few years later the casual recording of dynamos with 15,000 horse power and generators of 52,500 horse power. In 1891 the city of Ottawa was elated over the operation of electric cars in wintertime, but a few years later the transmission of power from the Falls to Windsor, 232 miles, occasioned only a passing notice.

It was only 15 years ago that the Ontario legislature took notice of power development and provided for the co-ordination of effort by passing the Power Commission Act. Under this measure, purchases, leases and developments have brought practically all Niagara power under the Hydro-Electric Power Commission, which sells the power to the municipalities at a cost equivalent to the cost at the source of supply plus transmission charges and proportionate shares of sinking fund and maintenance charges.

In 12 years the commission's activities have grown from one system of 4,000 horse power supplying 12 municipalities to 11 systems embracing 280 municipalities and distributing 350,000 horse power over a territory as large as England. Five hundred separate farms in various parts of the province and 5,000 other rural consumers at present receive power from the commission, but a comprehensive scheme of rural supply has been worked out and further extensions are expected.

Almost from the outset, the number of power users kept pace with the power development. Surveys of

Busting the Bucket Shops

NEWSPAPERS and "stock exchanges" are carrying on a bitter war against the "bucket shops" and curb brokerages in which the common people are fleeced in stock speculation. Practically the only difference between a stock exchange and a bucket shop is in clientele, one being exclusive while the other invites the hoi polloi. The elements of the gambling are the same. There is this, perhaps, that may be said of the cheaper concern, that because of the opportunity more swindlers in proportion are bucket shopping, but the sheep are shorn in Wall Street by the same methods in both places. It makes little difference to an investor whether he is "sold out" or his deposit is stolen. The tiled floors of marble palaces in the financial district have seen more men end life with bullets than have the less pretentious establishments now under the ban.

Back of both stock exchange and bucket shop is a greater power than either, a power that holds the destinies of both in a grasp so tight that it is able to crush at any time. The same power has present control of the fate of legitimate business as well as of the speculative markets. *That power, through its ability to control the money volume, can rule or ruin as it pleases.*

In 1907 that power brought on a panic as suddenly and as unexpectedly as if a bolt had fallen from a clear sky. New York banks refused to honor the drafts from their country correspondents and the whole country was thrown into a turmoil. Wall Street went wild. Money commanded almost any rate. The power, represented by an international banking institution, held "the street" in suspense almost to the closing minute, then turned loose a stream of money it had obtained in ample time to have quieted business hours before.

The grip of that power has not lessened since 1907.

Government and Martyrs

GOVERNMENT never learns. The pendulum of national control may swing from absolutism to democracy, and governments may rise and fall, but each new generation of executives acquires almost instantly the colossal egotism of its predecessors.

All the experience of the ages and the simplest dictates of common sense seem powerless to save administrators from repeating the blunders of those who have gone before.

The recent sentence of Mahatma Gandhi, the Hindu non-co-operationist leader, to a six-year term in prison, is the latest example of the persistence of rulers in the belief that they can check the spread of political ideas by suppressing the leaders.

The imprisonment of Gandhi should be considered as quite aside from the justice of his cause. The movement for the freedom of India involves questions of racial antipathies, color consciousness, religious and caste hatreds, industrial exploitations, political self-determination, and perhaps most important of all the bitterness that springs from actual physical hunger of millions of persons. The Government of Great Britain believes that its paternal doling out of charity, religion, government, western education, military protection, improvements and what not, is a good thing for India. Much of India does not agree.

The wisdom of the arguments are unimportant. All arguments have been brushed aside by the exercise by the British Government of its power to place behind bars the exponent of a contrary political belief.

It matters not whether Gandhi's imprisonment was countenanced by the British cabinet, or the individual act of the inept and now discredited Indian régime, of whose selection the British Empire now repents. The British Raj will get the blame.

It has been the martyrdom of individuals which has given life to nearly all great political movements. Joan of Arc, burned at the stake, lighted the fire of nationality for France. "Bloody Mary's" executions rather than the divorces of Henry VIII gave to England its state religion. Robert Emmet's fiery words on condemnation to death and on the scaffold became Irish doctrine. John Brown's body moldering in the grave solidified abolition sentiment in the North and sounded the knell for slavery. Dwarfing but proving these individual cases, is the Christian religion, the surpassing proof of the futility of government repression.

Putting to death has gone out of style in present civilization, but prison still remains for government to utilize in martyring the individual and perpetuating his cause.

Credit: Straight and Mixed

IN THE bad, mad, foolish days of the "wet" era, the wiser were distinguished from the less wise drinkers by their preference in the matter of "straight" as against "mixed" poison. Psychoanalysts could probably trace the same tendencies in other things. Americans and Anglo-Saxons generally are much more partial to plain roast beef or corned beef and cabbage than to the "fancy" or "made" dishes prominent in the menu of the Latins.

Perhaps it is a sign of returning and spreading sanity that revolt is gathering against the Babylonish mixture of credits of two very different sorts as basis of our circulating medium. Take our Federal Reserve bank notes. Of what are they compounded? Section 16 of the Federal Reserve Act tells us:

> Federal Reserve notes are issued at the discretion of the Federal Reserve Board on the following collateral: notes, drafts, bills of exchange, or acceptances, or on gold or gold certificates.

Quite a wide discretion, it will be observed. Like national bank notes based on a single class of collateral, government bonds, these Federal Reserve bank notes are supposed to be issued on the credit of the issuing banks. As a matter of cold stern fact, it is not the credit of any one bank or group of banks that causes these notes to be everywhere current and receivable as "money." It is the credit—the honor and good faith—of the government of the United States of America; the confidence which the honesty and ability of that government commands universally. Without this credit back of every such note, precisely as it is back of every government bond, the notes would be valueless as medium of exchange—as "money." It is this government endorsement alone that makes them "money."

Why then confuse the nature of the credit that alone really counts by mixing it up with the credit of the banks—of private corporations run for the personal profit of the owners? Why should the constitutional prerogative of the United States Government to issue money be shared with these corporations? Why should the Federal Reserve Board be vested with the "discretion" mentioned in the section cited and amounting virtually to a transfer of sovereignty? Are the bankers above the Constitution?

This whole question might be brought to a head by an issue of real, straight and unmixed money based on the credit of the United States, or on a specific part of the productive wealth of the United States.

The forces controlled or influenced by the banks are clever enough to see that such an issue would be practical demonstration of the superior beneficence and practicality of straight money over mixed money; of honest over dishonest money. They realize that it would be the entering wedge for the full resumption by the government of its sovereignty; of its emancipation from the yoke of the "shent per shent" gentry?

Work and Worship

DURING a recent Sunday, on the invitation of the Greater Boston Federation of Churches, the pulpits of 25 churches in and around the Hub were occupied by as many labor leaders assigned by the Central Labor Union. It is now suggested that the ministers of these churches shall each on a certain day take the jobs of the workers.

This is an interesting variation on the idea of "exchange professorships" designed to promote better understanding, and consequently friendlier relationships, between various countries. Much of the trouble of our time may be traced to an illogical separation between labor and prayer; between practice and preaching. Let us have more of the spirit of worship in our work and a more constant translation of work into worship. In that way we shall be really doing something toward the world's redemption—the betterment of all humanity.

Let's Not Argue About It, Either

WHAT would happen if every member of the Senate and the House were to lose the use of his vocal cords for just one year?

Is there anyone who doubts that government would become less oppressive, that congressional acts as distinguished from congressional words would be wisely increased tenfold, and that the nation's full-lunged breath of relief would be 12 months long?

Congress has been proceeding cautiously for 133 years. It will not be accused of undue rashness if it decides now permanently to curb debate. The decision a few weeks ago to set a final limit on the discussion of the Four-Power Treaty in the Senate is one of the most hopeful signs the country has noted in years. Fear was present in the public mind that we were again to be watchers, perhaps even unwilling listeners, while the official debate dragged along through the months. The public has not yet forgotten the Lorimer case, the Ballinger-Pinchot controversy, the League of Nations battle, and others in which arguments passed and repassed before the public in long-winded review.

Nobody, least of all the Congressmen, imagines that congressional debate affects a single vote on any question at issue. Congressional arguments, whether actually spoken or "extended in the *Congressional Record*," are for public consumption. But thanks be, Congressmen can send their speeches to the public, but they cannot make the public read them.

The Four-Power Treaty debate is typical of questions before the two Houses. Borah, Lodge, Reed, Underwood, Walsh, John Sharp Williams and perhaps two or three others gave voice to enlightening discussion of controversial points. Other speakers expressed the "me-too" rehash, the "administration views," the anti-administration vitriol, and the plain garden variety of buncombe.

The American is chiefly notable throughout the world as a man who, upon seeing the necessity of doing a thing, goes and does it. It is too bad that the American Congress, upon seeing the necessity of doing a thing, proceeds deliberately to the duty of saying it.

Let's have an era of fewer good words and more good deeds.

Worth Trying

A FEW years ago there was a considerable demand for universal training for military purposes. The demand failed, partially because of the opposition of those who did not believe in the principle and partially because of the cost.

Recently, the Burlington and the Great Northern, Hill railroads, instituted a policy which might well grow into a system of voluntary industrial physical training of incalculable benefit to the country.

For 10 minutes each day, employes are put through snappy calisthenics and physical training. Employes have come to look forward to the healthful relaxation. Company executives report that the few minutes subtracted from industrial routine have been compensated for by increased energy and ambition displayed in the work.

Physicians maintain that the steady grind of unvaried employment slows up the productive energy of the individual. It would seem that on this ground alone, industrial interests would try physical training.

A Lesson for the Employer?

THE country has become accustomed to paying double and triple for the installation of all railroad equipment. When the X. Y. Z. railroad laid a rail at the Cattle Run Siding back in 1873, the financing was by bond issue. The public through passenger and freight tariffs paid interest on this bond issue for 30 years, then the matured bond was paid for by money obtained from a new issue of bonds, and the public took up again the burden of paying interest. Meanwhile, wear and tear had several times caused the replacement of the old rail, and other bond and interest operations similar to the first were made necessary.

The conviction has been so general that all railroad financing has been by bond issues with attendant commissions to brokers and annual interest charges, that it is a pleasure to announce a replacement in railroad equipment, financed by the day-to-day receipts.

Mr. John J. Jones, dining car waiter on the Congressional Limited Express between New York and Washington, has installed a complete new set of brass buttons, paid for entirely out of operating revenues.

So extraordinary is the case of Mr. Jones that the railroad has published a booklet dealing with him. He has been in the dining car service for 35 years, 25 of which have been on the same train. Every night it has been his policy to remove the buttons and shine them up. Ultimately, the polishings wore all the shine off and he was compelled to replace them. The cost has been taken out of Mr. Jones' operating revenues from serving 300,000 patrons.

Mr. Ford's Page

WHATEVER has been done to make war more difficult for the governments, this still remains true, that not enough has been done. This is said in no sentimental sense: the meaning is that not enough of the obvious thing has been done, the thing which everybody sees is needing to be done.

Most of our war preventives proceed on the false theory that war is a matter of sudden gusts of bad temper, that the people of two or more nations become so inflamed against each other that they simply demand each other's blood, and that the governments are powerless to hold them back from the fight.

We have had a number of treaties made on that theory. The treaties provided that a year should elapse before a declaration of war could be legal, on the theory that any nation's temper would be likely to cool in a year. The treaties are all right; if anyone observes them they may prove useful some day. But they proceed on the wrong theory. Tempers will cool in a year, but plans for profit will become more perfect in a year.

War is not originally a matter of national bad temper. If we could only rid our minds of that idea, we should have a much clearer understanding of the problem. A war is always determined upon first; and after that, the national temper is aroused. The science of making a nation angry is well known to certain groups of gentlemen who control the printed page. It doesn't take very long to whip a nation into a rage, make it believe its honor has been attacked, that its existence is in danger, that it is the victim of another nation that has harbored unfriendly designs against it all the time. These things are done as expertly as a new style of straw hat is exploited.

Any government can curb the temper of its people by simply stopping the flow of the material that incites to bad temper. Every government has done it. There are international forces that sometimes creep in under the tent flap, so to speak, and arouse a storm when a government's back is turned, but ordinarily, the government can always control the temper of its people, and every government has. The people of the United States are no exceptions to this provocative use of propaganda for the sake of inciting violence.

The one certain way of stopping war between civilized nations is by cutting out all possible profit from war. If anyone has any doubt of the pertinence of that plan, just arrange to have it proposed, and observe what a storm of opposition it will meet!

More potent than peace treaties, more drastic than the sinking of navies and the demobilizing of armies, would be the simple act of providing that any future war shall be profitless.

Of course, the learned men who befog the public mind with words that mean nothing, might suggest that governments have no right to enter upon that matter. Yes they have! Governments that can conscript human lives, that can fix prices, that can saddle unborn generations with the grievous burdens imposed by the war usurers, can decree that hereafter war shall pay no dividends to anybody—profiteers or non-profiteers.

The proof of the potency of this plan to stop wars is the refusal of the dividend-takers to permit the governments to adopt it. If they want to stop war, why do they still fight for the retention of war profits? Why, if not that they want the profits that war always brings to those who know the financial game?

It is not too late to begin on the last war. Many things could yet be done to stop the horrible plan which enabled certain groups to make money out of the world's last great war tragedy.

For example: The United States could say to the nations, "You borrowed a lot of money from us. You borrowed a normal dollar. But since you borrowed, the dollar has shot up in value to such an extent that whereas the dollar you borrowed would buy nearly a dollar's worth of goods, the dollar you are paying back will buy about half as much, thus requiring you to work twice as hard to repay a debt that served you less."

That would be only neighborly. If John Smith borrowed a dollar to be repaid in potatoes, and at the time of the loan the dollar would buy two bushels of potatoes; would his creditor and neighbor, John Jones, compel him to pay two bushels of potatoes that had gone to a dollar a bushel? No. John Jones would say, "Smith, it will be taking twice as much out of you as you received. We're human beings, let's be square with each other."

Will the United States do that? Not that anyone can foresee. Why? Because the money interests would not permit the government to inform the people to that extent about the tricks and crimes of high finance. If the United States did that, immediately the people of this country would be given a glimpse of the whole money system that would horrify them by its unfairness and cruelty.

The proposal would be simply that the borrower should repay what he borrowed and no more, instead of twice as much, as he must now do. Isn't that fair? Yes, but it is not finance, and it would cheat the very groups that foresaw and planned just that very thing.

Well, if they won't do that, maybe the United States will say to the nations, "Pay up your debt, but never mind the interest." That would be human, too. We don't gouge our brother for the money we lend him when his child is sick—we don't take advantage of his emergency to charge him interest? Neither should it be done by the family of nations in a world emergency. "Pay back what you had, but never mind the interest."

But will we do it? Not that anyone knows, because, you see, that would be showing up the whole interest-taking system which is the heaviest part of the practice of war-profiteering. People think that the war profiteers were those who charged a little more for clothing or sugar or manufactured goods. No, these were small fry compared with the financiers who dealt in no commodity at all except the people's money, and had nations and governments for their customers in transactions under which the world still staggers. These are the profiteers of the last war, and all the wars, until war is given its last blow by the elimination of profit. Yet you never hear these groups denounced for profiteering. Which is very strange, since their profiteering still goes on, and will continue until the last drop of interest is wrung out of the world—unless—unless the world rises in its moral right and cuts the whole game short.

There is a great deal of talk about canceling war debts. If only the plain people of the nations could be benefited by that course, it might be considered. But cancellation would be principally for the benefit of the financiers.

If financiers are willing to cancel the war debts, why are they not willing to have the debts repaid on the basis of values as at the time of borrowing? Why are they not willing to forgive the interest? Surely, friends of the greater thing ought not to hesitate over these lesser things. But they do hesitate. And there is a reason.

It is not too late to inaugurate a policy with regard to the last war that will cut off the profiteers there; and by simple extension of the policy to the future, you would soon find that our money lords would lose interest in pitting nation against nation as the fighting cocks of a crowd of sporty bettors.

THE fatal blow at war will not be struck until the money profits of war are eliminated. Anything less is simply vain. If you doubt that profit is the war group's main interest in war, just observe the storm of protest which greets every proposal to abolish profit; just observe every government's fear to attack that phase of the problem. Propose that we forgive the interest on the war loans; propose that we require repayment of the war loans at the value of our credit when we granted the nations our credit—and see how far the proposal goes. They are willing to cancel the war debts, oh yes; because that would benefit finance. But the other proposals, which would benefit people, are not favored. Do you know the reason?

Where Work Is Legal Tender for an Education

University of Oregon's Doors Wide Open to Students Who Earn Own Way

By HARRY H. DUNN

THERE remains in the United States at least one university, large in area, full in equipment, properly prepared as to faculty, and well endowed, in which the work of the hands of the boy or the girl who comes to it is immediately accepted as legal tender for every educational service the institution can give. Two-thirds of all those who have entered this university since its founding nearly 50 years ago have earned their entire way through.

This educational institution is the University of Oregon, located at Eugene, at the head of the Willamette Valley, with the beautiful Willamette River flowing in a curve around one end of the campus, the stream of which one of the older poets wrote,

> "Time that scars us,
> Maims and mars us,
> Makes no track nor trace on thee,"

and the state of Oregon is seeking to make of this university a thing as permanent in educational life as is the winding river beside which the men of the '70's erected it on a capital of $50,000—all subscribed, but not all paid in. Knocking at its gates for entrance since the first commencement in 1878 have come rather more than 10,000 students, of whom 3,000 have graduated and received their degrees, according to the alumni records. Former students to the number of 7,000 did not complete the work for degrees, but dropped out during the first, second and third years. This is considered a high percentage of completions.

But the important factor, and the one which is of interest to all who contemplate undertaking a university course, is that, by actual and accurate records, *70 per cent of all these students made their own way,* with the work of their own hands, through every day of their stay at the University of Oregon, whether it was for one year or for four. This year there are 531 students at this university who get no money from home, who earn every cent their education is costing them. "Undeterred by empty pockets," says Professor Powers, "these students, through summer labor, and 'spare-time jobs' in winter, at Eugene, are buying their clothes and books and paying for their laundry and board, the only expenses at the University of Oregon, where tuition is free. No job is too humble or too difficult for these determined boys and girls. They support themselves doing a multitude of homely tasks, and study and toil are linked in close companionship, as they should be in every democracy."

The interesting figures previously quoted further show that of these working students, 127 are freshmen; 110, sophomores; 111, juniors; 88, seniors; 44, specials, and 42, graduate students. Working for an education is not confined to the boys, for of the 531 who are earning every cent of their way to an easier and more complete life, 127, or about 25 per cent, are women. In addition to these, there are 632 students—429 men and 203 women—who are partially self-supporting. This year's enrollment at the university is 2,010. The figures show, therefore, that 25 per cent of these students are entirely self-supporting, and approximately 30 per cent partially self-supporting.

The university is strongly predisposed toward the working student; to the president, the board of regents, and the faculty, willing labor is legal tender for all manner of educational services that they can render.

"The University of Oregon is maintained by all the people of all the state of Oregon, that the opportunities for a higher education may be open to every determined boy and girl in Oregon," says Dr. P. L. Campbell, president of the university. "There are two outstanding features to the maintenance of which the entire control and management of the university are dedicated: One is a high standard of scholarship; the other is an atmosphere of real, sincere and practical democracy. Tuition is free and expenses are low; in so far as it is humanly possible, these two conditions will be continued as they are."

Though Eugene is a city of only 12,000, remunerative work is plentiful for those who seek it as a foundation for their education through the furnishing of the money which that education costs.

The Oregon state legislature in 1872 established the University of Oregon, "having for its design"—the lawmakers said—"to provide instruction and complete education in all departments of science, literature, professional pursuits and general education." The "complete education" so generally predicated by the legislature, has been the outstanding mark of the university since its establishment. "Professional pursuits," also mentioned, have received increasing emphasis, until today 10 professional schools, besides the college of liberal arts, are contained in the university. These are the colleges of architecture and allied arts, business administration, education, journalism, law, medicine, music, physical education, sociology and the graduate school. The college of literature, science and the arts, containing 23 departments, has given, without any sacrifice of cultural values, professional direction in many courses, such as geology, chemistry, biology, zoology, botany, dramatic art, public speaking, household arts, military science, pre-medic and pre-engineering, and many others.

The history of the University of Oregon has been one of growth along somewhat unusual lines, largely directed by Dr. Campbell, the president for nearly 20 years, and still the president, who describes the development of the university as follows:

"The Pioneer," representing the spirit of those who followed the Oregon Trail westward. It stands on the campus of the University of Oregon, and is the work of A. Phinister Proctor.

"During the early years of the institution, the only high schools in the state were located in two or three of the larger cities, and it was necessary for the university to offer preparatory courses that students graduating from the schools in smaller towns might continue their work by coming directly to the university. As the high school system of the state developed, it became possible to discontinue the first year of the academic course; a little later, the second year was dropped; and, finally, in 1904, the academy was entirely abolished.

"A similar growth may be seen in the evolution of the present course of study. When the university first opened its doors in 1876, the work of the different courses was practically all required. After a few years, options were allowed in the choice of language groups and substitutions were permitted for some of the technical requirements. Later, a great number of possible combinations of required courses were offered, with a few elective hours. Then came the group system, with the work for the first two years required, and the greater portion of the last two years elective, except for a major elective requirement. In the year 1904-05, the university adopted practically a free elective system of undergraduate study, attempting by the requirement of a major subject, to which not more than a third of the required hours were to be given, to give definite direction to the work of each student, and encourage the high and intense scholarship for which a university should stand.

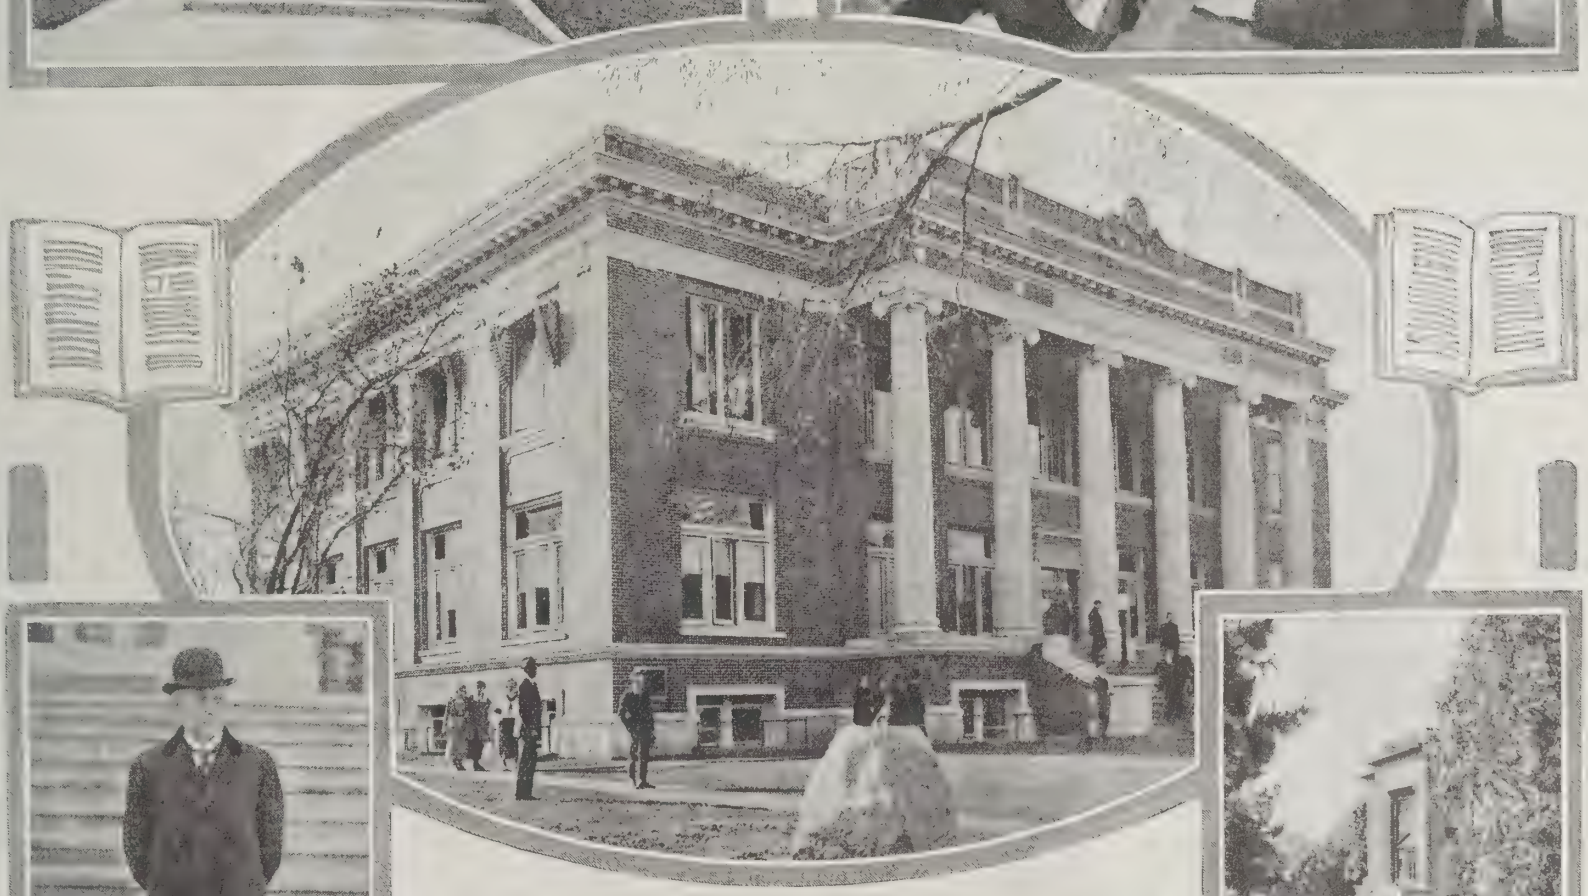
"Finally, the university has put itself in line with the most advanced educational practice by organizing its undergraduate work into the lower and the upper divisions. In the lower division, which comprises the work of the freshman and sophomore years, the aim is to have the student undertake such work as shall tend toward a broad, general culture, together with a solid foundation for his more advanced work. This is attempted by a group system of subjects. In the upper division, comprising the work of the junior and senior years, the student is required either to select a major subject, or to enroll in one of the professional schools of the university, for either of which he must have made the necessary preparation in the lower division. In the professional schools, the course will be largely or wholly prescribed, while the major department may demand not more than half the student's time for work in his special line, thus placing even more emphasis on intense scholarship during the years when such specialization may be most profitably attempted."

As in most western state universities, which have been, virtually since their establishment, the mainstays of education in their respective states, and have taken the places of the endowed private institutions of higher learning in the older and more densely populated eastern states, the University of Oregon has devoted special attention to its extension courses, believing that the advantages of the university should be forever at the command of all the people of the state, irrespective of their age or previous education.

"The modern state university," says President Campbell, "is coming to be regarded more and more as belonging to the people at large who support it, organized and administered to serve their higher educational interests. The University of Oregon recognizes that *it is responsible for far more than the instruction of the students who come to its immediate campus;* that its wider duty is to provide for the people of the state opportunities to acquire educational benefits from its faculty, and other repositories of organized information and instruction, and to communicate to them the truth discovered through research work and original investigation. The Extension Division holds itself out as the distributing agency for educational material, which the university has been able, so far, to organize for the use of the general public.

"This Extension Division is, further, the university's active representative throughout the state, serving in every way those who cannot attend educational institutions, stimulating and guiding them in their efforts to acquire a better education. Through some one or more of the several activities of the Extension Division, every person in the state may connect with the university."

One of the principal efforts of the University of Oregon in its attempt to be of assistance to the entire state, is the keeping of the high schools and the grammer schools supplied with competent teachers. At present, 277 teachers in the public schools of Oregon are graduates of the state university. This is believed to be a larger percentage of the entire number of public school teachers who are graduates of the state university than in any other state.



The teaching situation is surveyed every year by the university, and the 1921 survey showed that pedagogy is showing a yearly diminishing appeal to male graduates, only 66 of the 277 teachers, or less than 25 per cent, being men. These men are engaged largely in the administrative work of the public schools. The highest annual salary any one of these men receives is $4,450, and the next highest $4,100. Six receive $3,000 or more, while 24 receive from $2,000 to $2,750. Few men graduates are teaching in the high schools at less than $1,800 a year. Salaries of the women range lower—from $125 a month to $2,100 a year with a considerable number at the latter figure.

The uniformly low salaries are said to be the reason for the men graduates failing to enter teaching as a life work.

Democracy the Atmosphere of This University

"I'll Let Them Wait Till They Sweat Blood"

Wall Street Finance Writes Last Chapter of Railroad Romance

By CHARLES ALBERT COLLMAN

THERE is a railroad man who, west of the Hudson River, is regarded as the greatest expert in his line in the country. Newspapers value his opinions highly; an interview with him is considered important news. One day the great man arrived in New York in his special car, on business of decided urgency. It was of the highest importance—or so it seemed to him—that he should have an immediate conference with the financier of the railway system. When he arrived at the office in Nassau street, he was informed by the West Indian attendant that the financier was too busy to be seen that day. Again and again the railroad man called, but the financier was always "too busy to be seen." For hours daily, the great traffic expert sat on a long yellow bench, or wandered impatiently about the deserted board room, studying the huge map of the railroad system which hangs there, worrying about the problem that confronted it.

Daily the railroad man's nervous tension grew greater. Under his breath he cursed the important conferences that kept the financier so busy he could not confer on a matter of such importance to the road. On the twelfth day, the expert grew desperate. He walked to the private office of the financier, tapped on the door, opened it a trifle and peeped in. At the farther end, beside a window, the financier was lolling in a chair, in casual conversation with a friend.

"Pardon me," ventured the railroad man. "It's important, very important. I'll have to start back to Chicago by 3 o'clock this afternoon. My car's been made up. I've been waiting more than a week."

A Yiddish Phrase—What It Meant

THE financier swung about in his chair and glanced toward the speaker through his twinkling glasses. "Shut the door," he snapped. "Your salary goes on just the same."

The railroad expert shut the door and went back to Chicago, marveling at the strange ways of financiers with railroad men.

At another time, the head of a great railway system, whose arteries threaded the country from Chicago to the Gulf, traveled to Wall Street as fast as steam could bear him. He was one of the builders of the system, and chairman of its directorate. Several huge bond issues were coming due. They had to be met and the debt refunded. For months he had been corresponding with the road's banker, but without results.

The chairman called at the financier's white marble banking house in the financial district. He talked with the banker, pleaded, remonstrated, expostulated.

Finally, the financier mentioned a figure at which he would finance the requirements of the system.

The chairman started back, as though he had been struck in the face. "My God, sir," he exclaimed. "You are charging us 18 per cent for the money. That will ruin us."

The little financier shrugged his shoulders. All further conversation was useless.

The chairman walked unsteadily from the banking house, his mind bordering on distraction.

During this interview, there had been a visitor in the office. He now approached the financier, and asked him curiously: "Why don't you give those people the money? You're banker for their road. You've got to let 'em have it in the end."

The financier grinned. He replied deliberately: *"I'll let 'em wait till they sweat blood at the nose."* The phrase was spoken in Yiddish. The speaker placed thumb and forefinger to his nasal organ and tweaked it with an expressive gesture.

He did make them wait, and he made them sweat blood. The cost of his "financing" was so high, that a year or two later the great railway system went into a receivership and was dismembered. As usual, the public paid the bill.

The Banker and the Railroader

WALL Street bankers, as a rule—with the possible exception of an alien group—are agreeable and affable in business life. They are men of wide outlook, and entertaining experiences. *What is the cause of their contemptuous attitude toward the men who build and operate America's great transportation lines?* There is an element of psychology in the problem. The relation of the banker to the railroad man is something on a parity with that of the cat to the mouse, the spider to the fly. And many a small Wall Street banker has devoured a great railroad and a great railroad man.

At the present writing, various "protective committees" are clamoring in Wall Street for justice to the bond and stockholders of a certain railway property. The story of their efforts is involved in the greatest romance in American railroad history—and its greatest tragedy. It is the Odyssey of bold and capable men who did and dared the impossible. But in the hour and triumph of their achievement, the fruits of their work were torn from their hands by a Wall Street banking group.

One day two men met quite by accident in the lobby of the Holland House, New York, then the recognized rendezvous of the railroad men of the country. One of them had just arrived there from Denver the day before. He was tall and slim, of advanced age, but keen and agile, with a clear blue eye and cheeks highly colored by the winds of a mountain country.

Joseph Ramsey, Jr., then president of the Wabash, and first lieutenant of George J. Gould in the East, chanced across the westerner in the old Holland House lobby, and recognized him as Edward T. Jeffery, president of the Denver & Rio Grande Railroad. The men shook hands, and during the talk that ensued, the western railroad man confided to his eastern confrère that he had come to New York in the hope of interesting some capitalists in his property.

Some years before this, the Rio Grande had been spoken of contemptuously in Wall Street as "the streak of rust in the desert." But Jeffery had now built up the road until it wound itself like a spider's web over the face of Colorado. The railway had developed with the state, and distributed the products of its mines to the four quarters of the Union. Eastward, at Pueblo, it connected with the Missouri Pacific, and transported its traffic westward to Ogden, where, making a connection with the central division of the Southern Pacific, the freight was continued to California and the coast. Toward the South, it had an outlet at Galveston.

After discussing the prospects of the Rio Grande with Jeffery, Ramsey left the western railway man, but later chanced to mention the encounter to Gould, who, keen to acquaint himself with the situation in Colorado, said: "Bring him to see me."

Jeffery was introduced to Gould, who took an instant liking to him, and the two men have ever since been the closest of friends. Gould at this time was still attempting to carry into execution one of the gigantic railroad dreams of his father—the extension of the Missouri Pacific system westward to the Bay of San Francisco. The great Gould railroad was slowly creeping out toward the Rockies, and now extended a long, thin arm to Pueblo, while to the South, the Texas & Pacific was already at El Paso. There the two roads reached connections with the Southern Pacific.

Gould has a vigorous personality, snappy black eyes and an athletic frame. He had learned what fighting was in the East, where he had marched like a conqueror to Pittsburgh, in the face of powerful enemies and a thousand obstacles. Now he was to meet a dangerous rival, frail physically and in impaired health, it is true, but possessed of an indomitable will.

Edward H. Harriman was fated to set the American railway world in turmoil. This was not due so much to any especial combativeness on his part. But the sudden growth of American industry made a tremendous demand upon the country's transportation systems just when he was at the apex of his career, and he became the central figure in all the great contests.

What Gould was taking years to achieve, Harriman accomplished in a day. He gained possession of the Southern Pacific overnight, and made himself master of the whole California coast. In fact, in acquiring the Southern Pacific, Harriman had bottled Gould up in Colorado, blocking the westward progress of the Missouri Pacific, and putting an end to its business to and from California.

The Battle of the Giants

THE situation threatened disaster to the Gould system, and it was inevitable that Gould should hasten to build his own independent line to San Francisco, to relieve the tremendous traffic pressure toward the sunset.

Gould was the very man Edward T. Jeffery was eager to see. He warned him that Colorado, encircled on three sides by the rival systems of Harriman and Gould, was becoming the storm center of an impending clash. The man from Denver revealed the alarming fact that a quiet, secret movement toward consolidation had already begun among the Colorado lines, and that should the Rio Grande fall into unfriendly hands, Gould would be forever barred from penetrating the Rockies, since the Rio Grande commanded all the available passes, and the last chance would be lost to the Gould system of reaching the Pacific.

Gould was startled. He heeded the caution, and immediately bought control of the Denver & Rio Grande. But Jeffery, the far-sighted westerner, now placed before the railroad builder his vision of the future, of an independent line that should stretch across the sandy plains and creep through the mountains until it reached the waters of San Francisco Bay.

On the surface, all appeared to be amicable between the two railroad antagonists. Harriman became a member of Gould's Denver & Rio Grande. But he was secretly hostile to the line, and was bent on routing all the business that the central division of the Southern Pacific could stand via the Union Pacific system at Ogden.

Gould, on the other hand, was a director of Harriman's Union Pacific, but was now quietly planning to parallel the Southern Pacific division to the coast, and thus extricate himself from the coils that his rival was winding about him.

During those years, an old-fashioned, musty environment prevailed on the upper floors of the old Western Union Building, at 195 Broadway, where the Gould offices were located. They spoke of a traditional past. Rarely was anyone to be seen in the dreary halls, which were paved with large stone flags, colored inharmoniously, and arranged in hideous mosaics. Between the dark door frames, on small panes of ground glass, were the names of the Gould roads as they then existed.

Once in a long while some messenger boy slouched past, whistling, through those dismal passages, or from an unknown covert, an antiquated figure would crawl by, with an account book under his lean arm, bound for some hole where he had burrowed probably for the last quarter of a century.

What went on behind those closed and silent doors? The scenes were being set for the play that was to be staged in the mountains of Utah and California and the deserts of Nevada—the last of the great railroad contests to be fought out on American soil.

Jeffery had become Gould's most trusted associate, and in these offices the two men labored in secret, projecting the Western Pacific. One problem confronted them that seemed insurmountable. The Sierra Nevada Mountains were regarded as impassable. True, the central division of the Southern Pacific crossed the range at an elevation of 7,500 feet, with a maximum grade of more than 2¼ per cent, but that was considered the most advantageous pass, and a higher gradient would place the projected Western Pacific at a disadvantage, which would inevitably spell ultimate disaster for the enterprise.

Was it possible to discover a low-grade pass through the Sierras? Secretly Jeffery dispatched the chief engineer of the Rio Grande and a corps of his assistants to the mountain country to make surveys. Anxious months passed while the engineering experts traveled through the range, seeking an advantageous passage which would permit the construction of a railway line at reasonable cost.

Pass Through Mountains Found

ONE day the electrifying news reached the Gould offices that the men in the field had found the desired outlet through the mountains. They had gained a route through Beckwith Pass, through the right of way of a logging road, and by the canyons of the Feather River and its tributaries in the Sierras. It was found that the main line could be constructed here with a maximum gradient of one per cent; that is, a rise of 52 feet to the mile. The Western Pacific could pass the summit at an elevation of 5,000 feet, thus eliminating the necessity for snowsheds, and as a result of the easy grade, the new road would be able to haul as heavy a train over the summit of its line with one locomotive as the best of other existing lines could handle with three.

The Gould offices seethed with excitement at this intelligence. The chief difficulty had been removed, but another problem had yet to be solved. Could the projected road be made to pay? It would have to pass through hundreds of miles of as yet undeveloped territory. Was there enough traffic in sight to enable the new enterprise to be operated without a heavy loss?

Again, and as secretly as before, corps of engineers were sent into the field to project a line and make reports on the nature of the country through which it would pass.

The scouts came back with glowing accounts of the territory. They reported that along the contemplated line were great lumber, mining and cattle industries. Of timber alone, there were more than 100,000,000 carloads in the tributary country. Some of the most productive gold fields of California were in the traversed territory. From Sacramento to Oroville, the road could be made to run up one of the greatest fruit-growing sections of the country. Spring Garden, American, Indian, Mohawk and Sierra—these were but a few of the valleys waiting for a railroad to move their freight.

The reports of these investigations and preliminary surveys were accepted enthusiastically in the Gould camp as tokens pregnant of success. Harriman was evidently still unsuspecting, although rumors were persistent that warfare had broken out between him and Gould. These were denied positively. But subsequent events made it more difficult to maintain this fiction of amity. The truth could no longer be concealed. The Western Pacific Railway Company was incorporated. Jeffery, as president of the Denver & Rio Grande, at the annual meeting, made an official announcement, disclosing the plans by which the Rio Grande would seek an outlet to the coast, and describing the events already detailed, which had led to their undertaking.

The story was out. Gould's scheme was now matured. He suddenly resigned from the Union Pacific board, announcing that he did so because he was about to become the rival of Harriman in disputing the business of the Pacific Coast. It became known that Wall Street bankers had agreed to underwrite an issue of $50,000,000 bonds for the construction of the new trunk line.

Harriman Takes Up Gauntlet

HARRIMAN, not in the best of health, regarded this action and challenge of his more youthful opponent with concern. But his spirit was undaunted. He took up the gauntlet and resigned from the board of Gould's Denver & Rio Grande. He also struck the first blow. Gould's Denver road had a contract for through traffic with the Central Pacific and the Oregon Short Line. Harriman canceled this contract and virtually put an end to the movement westward of freight on the Gould system, and to its obtaining any further business from the coast.

It was urgent now for Gould to strike hard and strike quickly. By the abrogation of his traffic contract, Harriman had dealt a deadly blow to the Gould lines. Through the passes of the Alleghenies in West Virginia, at that time, from the mining regions of Western Maryland, crawled Gould trains, coal laden. From the forests of Michigan they ran into the roaring city of Pittsburgh. They dotted Iowa's corn belt and the wheat regions of Kansas, penetrating the valleys of Arkansas. They threaded a network of intricate lines through Louisiana and Texas, to Galveston and New Orleans, extending to the Mexican border at El

Protecting the Nation's Forests Calls for Men of Skill

By OTTO L. ANDERSON

Lookout tower, forest officers on observation.

WE HAVE all seen movies of the great Northland where the hero mushes his way, with his faithful dog team, through innumerable obstacles. We have perhaps all placed ourselves in this hero's rôle, which means we all have the love of the great outdoors in our blood. This is particularly true of the younger generation. Before the mind has matured, every young American boy cherishes an inner desire to become a cowboy, yes—perhaps a brave bandit, a detective or other officer of the law, or a prodigal son in our large mysterious forests.

In connection with this ambition to become a forester he includes meeting the strange creatures of the wilderness and carrying large packs on his back, fighting forest fires, camping, trapping, hunting, canoeing and in general enjoying the free life of an outdoor man. It is only natural that the average boy should have these ambitions. It is the manhood in our boys coming to the front. It takes men to do these things and every one of them secretly wants to prove that he is a man. It is in this stage, while accounting only for the present, that our young men are apt to be misled. Better to wait until their minds are matured before the parents allow them to choose their profession. Then, with a broader view of life they may want to study law, medicine, or if they still cherish some childhood plan for life, let them go ahead with it.

Good foresters are not born, they are made. Forestry is the right profession for the right man. To qualify as a forester, with intentions of making forestry a profession, a man must first "have it in him."

Next, the technical side, requiring a university education, must be acquired. A man surviving these first and fundamental ordeals has yet to add experience to his list before he is a qualified forester. The experience should last about three years, most of this time to be spent in the forests, referred to as the "field." You can readily see that adopting forestry as a profession is, therefore, quite a task. It would be useless for a man, lacking the inclination for this work, to attempt to become a forester.

In contemplating what we are to derive from this life, I am sure you agree with me that before the lure of money, comes health and happiness. Fortunes are not made and lost in a day in protecting our forests. As one man put it: "You may say that no forester ever died wealthy." That does not mean that it is a struggling existence, however. Good salaries are paid to competent foresters. It affords a comfortable living and above all other inducements, it offers outdoor recreation, health and happiness.

Second only to agriculture, our forests are our greatest natural resource. In adopting forestry as a profession, therefore, the work of protecting our forests carries with it as much of a civil obligation as a means of a livelihood. A person must, as has been said, "have it in him."

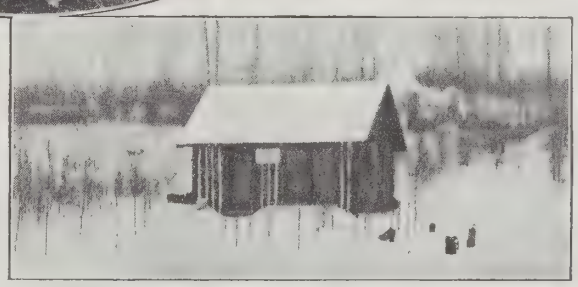
Every spring hundreds of schoolboys, still in their teens, apply for admittance into the forestry service for the summer months. In hiring these boys it has been experienced that it is only their childish ambitions, still existing, crying for something big before they are ready for it. Ninety per cent of them view this life as a "snap," but soon after these man-sized tasks are placed on their youthful shoulders they realize their folly and are content at home. Of course, one must allow for exceptions to this rule. Frequently, boys are found who "have it in them" and make good foresters.

"Having it in him" means that he has more or less of an overdose of love for the great outdoors; a love for the wilderness and its solitary companionship. To qualify as an outdoor enthusiast he must also be a sportsman and realize the value of nature. He must be clear-minded enough to recognize that game, fish and forestry laws were made for his benefit and the benefit of future generations. He must also realize that it is a moral duty for him to apprehend any violators of nature's written and unwritten laws and if prosecution is not desired he should explain the situation to the offender in the right light. I am going to quote the creed of the Empire State Conservation Commission, of New York, by which every sportsman is asked to abide:

"I believe that God has lent us the earth for our life. It is a great entail. It belongs as much to those who are to come after us as to us, and we have no right, by anything we do or neglect, to involve them in any unnecessary penalties, or to deprive them of the benefits which were in our power to bequeath."—*Ruskin.*

If a man, using this creed as a standard, can see that it is a civil duty to protect these gifts, rather than an obligation he owes to his employers, I think it is safe to say he "has it in him."

The technical side of forestry, as previously mentioned, is taught in the universities. After four years of study, a graduate is given the title of "Bachelor of Science in Forestry." The course explains the scientific side of this work, the study of plant and tree growth, insects and tree diseases, geology of soils, chemistry of natural substances, nature studies, general instruction in woodcraft, cruising, surveying and numerous other subjects which dovetail into a forester's life.



Of course, there are branches of forestry work that do not require a university education, but a person who intends to adopt forestry as a profession, should not neglect the technical side. Forest Service organizations also employ men stationed in the field who are known as rangers, patrolmen (forest guards) and also men used in such general forestry work as planting trees and fighting fires. To this list we must also add timber markers, lumberjacks, cruisers, scalers and timber surveyors and appraisers.

Patrol outfits about to separate to cover their "beats".

Forest officers entrenching ahead of a peat fire.

Ranger's cabin, Orr, Minnesota.

The Boy Scout creed is followed in picking men for ranger positions. To qualify for this work a man must be "physically strong, mentally awake and morally clean." Last, but not least, he must be a worker and have a pleasing personality, so as to create a favorable impression on the people with whom he comes in contact. We have found that public sentiment and cooperation are the greatest tools we have in protecting our forests. It is, therefore, highly desirable that the forester create a feeling of good fellowship toward the organization. Rangers are generally appointed as a promotion from patrolmen. A patrolman has the advantage of understudying the rangers' duties and at the same time obtaining actual experience. He is, therefore, capable of filling any vacancies that may occur. Some universities offer a four months' course to fit men for ranger positions, but if a man has the other qualifications for this work, an ordinary education is all that is necessary.

Here are some of the duties which a ranger is required to perform: He must take the proper precautions to prevent forest fires and extinguish them when they have started; act as the hand of the law when occasion requires; when ordered, he must make surveys of land, mark and scale timber, classify various types of soils and appraise large stands of timber; he must co-operate with all community organizations and procure their good will; he must keep a general lookout throughout his district for fire traps, including slash left by lumber companies, and dispose of these. Complete reports must be sent, from time to time, to headquarters keeping those in charge posted on his activities. He must post signs of warning throughout his territory. In general, he must know every person in his district so well that, in case of a large conflagration, he can procure the necessary help to extinguish it immediately. Here is a bit of verse that is more truth than poetry:

Recipe for a Ranger

First, get a big kettle and a fire that is hot,
And when everything's ready, throw into the pot,
A doctor, a miner, of lawyers a few,
Add one sheep herder and a cowboy or two.
Next add a surveyor, and right after that,
A man with some sense and a good diplomat;
At least one stone mason, then give it a stir,
And add to the mess one good carpenter.
A man who knows trees, and don't leave from the list
A telephone man and a fair botanist.
The next one that's added must be, that's a cinch,
The man who will stay when it comes to a pinch.
Add a man that will work and not stand and roar,
Who can do ten thousand things and then just a few more.
Now boil it up well and skim off the scum,
And a Ranger you'll find is the residuum.

Forest officers crossing lake on rafts.

Of course, the duties of a ranger vary according to the territory in which he is located, but, summing it up, he is the one man who must be a master of his craft and a "jack-of-all-trades." In all his duties a ranger is assisted by his patrolmen.

Each ranger has, as an average, three or four patrolmen who act as his assistants. To become a patrolman, a man having the physical qualifications must have a general knowledge of woods work and be a good worker. He must know how to run a section line, distinguish between various trees, draw rough maps while in the field, survey land and know how to attack and extinguish a fire should one occur. Most of his time is spent in the field going from one place to another educating the people of the danger of being careless with fires and how to take proper steps to extinguish them.

The patrolmen and rangers, as well as the other help employed in the field, form the nucleus of any Forest Service organization. The responsibility of protecting our forests rests on these men, but the technical foresters must not be omitted.

The technical forester, or the man who has adopted forestry as a profession, is the man who does the figuring. His education and experience make him an authority on all forestry matters. He is the man who plans all the field work and issues the instructions as to the proper way to carry it out. He is looked to for advice on all matters of importance and it is on this advice that the rangers and patrolmen act.

I have endeavored to explain the various positions which foresters hold, and their duties, but I have not told you what I think of "Forestry as a Profession."

Frequently we hear of men who dedicate their lives to one cause. Doctors frequently spend a lifetime studying a disease and its cures. So with a forester—a man who intends making forestry a lifetime profession dedicates himself to the protection of our forests. Every day he preaches the gospel of "Care and Carelessness." From his toil he derives a livelihood, but what other reward does he receive? As a profession it is perhaps the most healthy life there is and he has an inner satisfaction, unknown to the money-mad man, that he is serving civilization and nature. He enjoys the free life of an outdoor enthusiast. All branches of outdoor recreation are his—fishing, hunting, trapping and camping. He is a friend of our animals. His work earns for him the reputation of being an authority on our greatest asset—nature. What more could one ask? A life filled with happiness and contentment, enjoying at all times the good health that close contact with nature always brings.

Banks' Fight Against Guernsey Pound Notes

Private Banking Institutions Show Jealousy of Island's Currency

By W. P. CROZIER

Note: The experiment by which the Isle of Guernsey avoided interest charges on public work, is here presented from another angle, the writer being a staff member of the Manchester *Guardian*. Previous articles may be found in issues of February 18 and 25.

IN GUERNSEY, one of the little Channel Islands, there are in circulation certain £1 notes. It would be a matter of no interest if these were only the usual English Treasury notes. But they are "States-Notes" of Guernsey, a native product, and date back from a century ago, when from 1816 to 1837 Guernsey made an experiment in currency of a startling kind and suddenly, under circumstances still partly unexplained, ceased to experiment. The States-Notes still circulating are the remnant of a much larger number issued during those 22 years. This experiment was directed to an end which many people and places have desired to reach. Guernsey aimed at raising money for capital expenditure *without paying interest on it* and thought that an easy and conclusive way had been found by the issue of States-Notes.

Of the States-Notes dating from the period of experiment (now known as the "old notes") the exact number still in circulation is 41,191. After the outbreak of war in 1914, War-Notes were issued and about £125,000 worth are in circulation. Their values are £1, 10s and 5s. There also are "Guernsey Notes." Guernsey has no definite gold reserve, as the States' balances fluctuate. Therefore, these notes are not based on gold. The ratable value of the island is the main security for the Guernsey Notes.

Guernsey is one of the little group of islands that lie off the French coast in the great bight that has Cherbourg at the north and Brest on the east. Geographically, they belong to France; they are rocks cut off from the French mainland by the seas that have swept away the intervening softer land. Originally, they were part of the Duchy of Normandy and are the last remnant of French soil that still remains to England. Their official language is still French and they have a French metal currency (though, of course, English coins circulate) and they have their own organs of government. Thus, Guernsey has its own Parliament—Etats or States—and in local matters it rules itself, subject to the control of the Privy Council in London.

War Brought Change in System

IT WAS the States which in the days of deep depression following the Napoleonic War devised the expedient of issuing their own notes to avoid raising a loan on which interest would have to be paid. In the Channel Islands, as over the whole of England at that time, trade languished, heavy capital expenditure was required and the canny islanders looked around to find a way of providing the money without taxing themselves. Their revenue was £3,000 a year, the interest on the existing debt and their ordinary expenses amounted to £2,390, so that only £610 was left for other expenditure of every sort. A memorandum drawn up by the bailiff of the island (who presides over the States) explains the disastrous condition of things at the end of the war which led to the decision to issue paper currency. He said:

"In this island, eminently favored by nature, nothing had been done by art or science toward the least improvement; nothing for the display or enjoyment of local beauties and advantages; not a road, not even an approach to town, where a horse and cart could pass abreast; the deep roads only four feet six inches wide, with a footway of two to three feet, from which nothing but the steep banks on each side could be seen, appeared solely calculated for drains to the waters, which running over them rendered them every year deeper and narrower. Not a vehicle, hardly a horse kept for hire; no four-wheeled carriage existed of any kind, and the traveler landing in a town of lofty houses, confined and miserably paved streets, from which he could only penetrate into the country by worse roads, left the island in haste and under the most unfavorable impressions.

Spirits' Duty Not Enough

"IN 1813 the sea, which had in former times swallowed up large tracts, threatened, from the defective state of its banks, to overflow a great extent of land. The sum required to avert the danger was estimated at more than £10,000, which the adjoining parishes subject to this charge were not in a condition to raise. The state of the finance was not more consolatory with a debt of £19,137, and, with an annual charge for interest and ordinary expenses of £2,390, the revenue of £3,000 left only £610 for unforeseen expenses and improvements.

"Thus, at the peace, this island found itself with little or no trade; little or no disposable revenue, no attractions for visitors, no inducement for the affluent to continue their abode, and no prospect of employment for the poor."

At first the only expedient that the unfortunate islanders could think of to repair their roads and embankments was to clap a duty on spirits consumed in the island. This went some way, but not very far. There arose the question of the Market House, a building that deserves to be famous in economic history, since, in the opinion of the Guernsey Islanders at least, it was built without any burden of interest on the capital sum which it cost. It was built, in a word, by States-Notes.

The market, like other things in Guernsey, was in a bad way. "Humanity," said a committee of the States, "cries out every Saturday against the crush which it is difficult to get out of; and every day of the week against the lack of shelter for the people who, after arriving wet or heated, remain exposed for whole hours to wind and rain, to the severity of cold and to the heat of the sun."

In the spring of 1816 the States rejected the first scheme presented to them for an issue of £1 notes—a very cautious scheme, for it provided that the States should not "under any pretext whatever" issue any more notes until the first modest issue of £6,000 had been called in and canceled. That meant that the advisers of the States knew well enough that if they multiplied their paper money recklessly and put more currency into circulation than the normal needs of the island justified they would pay for it in inflation and a rise in the price of commodities. Nevertheless, this idea of financing work by means of the printing press without payment of interest is highly attractive and easily lays hold of men's minds. On October 17, 1816, for the first time the Guernsey States decided to issue notes—4,000 £1 notes, the money to be used for the improvement of the island's roads.

Market House Is Erected

"IN THIS manner," they said, "without increasing the debt of the States we can easily succeed in finishing the work undertaken." Naturally, they found the plan too attractive to abandon. In April, 1817, with great financial caution, they applied the conventional method to the purchase of the site and buildings of the meat market. They borrowed £5,000 at four and one-half per cent interest. That meant an addition of £225 a year to the burden of interest on their national debt—no small item in a small community whose total revenue was only £3,000. So when, having acquired the market, they found that they must enlarge it and cover it in, they revolted from the antiquated idea of piling up interest-bearing loans, bethought themselves of their happy expedient in the previous October and plunged definitely into the issue of States-Notes. This time there was no nonsense about redeeming each issue before launching another. They issued £4,500 in £1 notes and decided to cancel them at the rate of £450 a year. The annual payments for the redemption were to be found thus:

Rents from 36 butchers' shops	£150
Spirit duty	300
	£450

At the end of 10 years they would have a clear income from the market of £150 a year. They would, it is true, have lost the interest which they would otherwise have gained on £450 a year. But had they made an ordinary loan they would have had to repay the £4,500 and interest, too. The Guernsey States stuck like glue to the idea that they were building themselves a fine market house without paying interest. A fine market house, indeed, it was—"one of the most convenient both for buyers and sellers, that can be found in any part of the world," as it is described.

The Guernsey States, which must by this time have thought the rest of the world simpletons by comparison with themselves, now proceeded at frequent intervals to issue more States-Notes. The city authorities, having raised capital without the obligation of interest, argued that by precisely the same means they might get rid of the interest-bearing debt which already weighed on them. So in 1820 and 1821 they issued notes and paid off large lumps of debt. The Finance Committee of the States explained the machinery cheerfully in these words:

"Respecting the floating debt, which consists of sums payable at times more or less distant, it would be easy to discharge it by £1 notes put into circulation as need requires. The extinction of the whole of the floating debt could thus be brought about without the necessity of new loans. If loans should be raised it would be necessary to provide for payment both of the principal and of the interest. If, on the contrary, recourse is had to £1 notes, the interest alone which would have been paid will suffice."

Notes Affect Exchange?

FROM the idea of debt redemption the States went on to reflect that in 1817 it had borrowed £5,000 at four and one-half per cent to buy the site and buildings of the market and that here also was a nice round sum of interest which there was no need to pay. The thing to do was to redeem it by States-Notes—"by this means the interest of £200 (really £225) a year will be saved, and applied, moreover, every year to withdraw from circulation £1 notes issued for the construction of the market." After this, notes were issued to build a college and schools, making street improvements, taking precautions against cholera and so on. In 20 years more than £80,000 had been authorized—an amount four times the size of the debt of the island at the end of the Napoleonic War. In 1837 there was £55,000 of notes "out" and one of the defenders of the currency declared that "the States, by having notes to the amount of £55,000 in circulation, effected a saving of £1,600 raised without causing a farthing's expense to any individual of the public generally, for not one could urge that he suffered a farthing's loss by it." And the *Gazette*, the journal of the island, said that the bailiff, Daniel de Lisle Brock, who was the ruling spirit in this financial policy, had "known, as a wise administrator, how to continue the means of effecting this great good without imposing the least tax or inconveniencing his fellow citizens." But was that really so? That is the question. At all events, this same *Gazette* is found protesting that the issues of States-Notes had "neither directly nor indirectly burdened commerce in any way nor contributed to the rise in exchange that is experienced." That is to say, the critics of the notes, who were now becoming vocal, were maintaining that the multiplication of them was adversely affecting prices in the island and the rate of exchange and that the inhabitants were paying just as certainly—though not so obviously—as though they were paying interest on national debt.

Private Banks Step In

THE experiment came to a sudden end in 1837. There were two reasons. Criticism of the unseen effects of the States currency had unquestionably begun and there was a minority in the States who attacked the majority for anticipating the revenues by earmarking them for the redemption of notes.

But also two private banks had entered the field. They were issuing notes of their own, were flooding the island with paper money and were actually demanding that the number of the States-Notes should be restricted.

Daniel de Lisle Brock complained indignantly that one of these two, the Commercial Bank, "appeared to have for its principal object the issue of paper money" and he grew very indignant over its claim that the States, being now only one of three note-issuing bodies, ought to issue only one-third of the total number of notes in circulation.

The States were summoned to protest and to demand that the issue of notes should be restricted to the number really required—so that the States clearly had the knowledge that when that limit was exceeded, the public, and the public interest, must suffer.

Brock very naturally wanted the issue of notes by the banks stopped altogether. He said:

"If there is one incontestable principle, it is that all matters relating to the current coin of any country have their source in the supreme prerogative, and that no one has the right to arrogate to himself the power of circulating a private coinage on which he imprints for his own profit an arbitrary value. If this is true for metal coins, still more so is it for paper money which in itself has no value whatever.

"Has not experience shown us the danger of private paper money? Can we have forgotten the disastrous period when payment of one hundred thousand one-pound notes put into circulation by two banks enjoying good credit was suddenly stopped?"

The States seemed to be in a fighting mood and appointed a committee to uphold the cause of their own notes.

But the banks, or the critics of their 20-year policy, were too powerful for them.

For the upshot was that they agreed with the banks to withdraw 15,000 of the £1 States-Notes at once, not to keep more than about 40,000 in circulation, and to abstain from all banking operations. The banks, it is true, gave them considerable compensations, but the States, to cancel their notes, had to contract loans for £15,000 at three per cent and so suffered, as they lamented, an annual loss of £450. It was the defeat of their policy of raising money without paying interest on it, though the 40,000 notes still remained in circulation.

Work Done Without Interest

THERE is no doubt that on the face of it the States got certain work done *without paying interest on loans* and at one time the fact was made much of in economic discussions in England. Of course, the sums involved are very small and the economic consequences very hard to trace. J. T. Harris, to whose book on the subject I am indebted for the facts of this article, has not found, after this lapse of time, that the Guernsey public paid indirectly the tax which it thought it had escaped, but Sidney Webb points out that a rise in prices of one-half penny in the shilling would have been equivalent to an interest charge of four per cent and that for all we know now such a rise did actually take place. Or, as he suggests, the Guernsey States may have paid for the material for their Market House by exporting metal and the notes may have filled the actual needs of the currency of the island and so, in the early stages of the experiment, have caused no inflation and rise in prices. Remembering that the States had issued at one time £90,000 in notes and that, toward the end of the experiment, their champions had to rebut the charge that commerce and the exchange had been adversely affected, we may perhaps conclude that while Guernsey got certain large works done without direct payment of interest, she was paying unconsciously as the debt of notes expanded and that the competition of the banks was only the final blow that drove her back to the payment of interest.

Bringing Religion to Knights of the Crosscut Saw

By CLARENCE N. COOK

THE REV. MR. DAVID T. CRUDEN

PROBABLY not many men during their life work have met with more thrilling adventures and yet remained unharmed, than has David Cruden. As a boy he spent hours poring over stories of adventure. While he read of deeds of men in the Far West and North, of the mounted police and the lumberjacks, he longed in his little home in Scotland for a glimpse of the great and unexplored territories with which the fictionists seemed so familiar. Years afterward, Fate led Cruden into many strange quarters and through hair-raising adventures. Attacked by a black bear and packs of timber wolves, caught in the midst of a log jam, surrounded in his home for three days by forest fire, Cruden came through unscathed.

But these have not been the things which have worried Cruden most. Four children have come to grace the Cruden household. The first, David, Jr., now 12 years old, was born in England; Harry, 10, claims Scotland as his birthplace; Clifton, eight, was born in McMillan, Michigan, and Adela, four, was born in Canada.

"When these four grow up and argue over the relative worth of their various birthplaces, I don't know how I shall settle the disputes," said Cruden. "Probably the same God will come to my aid who has carried me through many another perilous place." Thereupon hangs the story.

David Cruden decided early in life to be a minister. Then he was married and it was while finishing his theological studies in England that his first child was born. He returned to Scotland, later came to America and finally was assigned to the little town of Barwick, Ontario. He took his station up north, "where," he says, "the valleys are chock-full of silence and crystal air is bathed in pine scent." There, several weeks ago, the Rev. Mr. David T. Cruden finished six years' preaching the gospel to the lumberjacks.

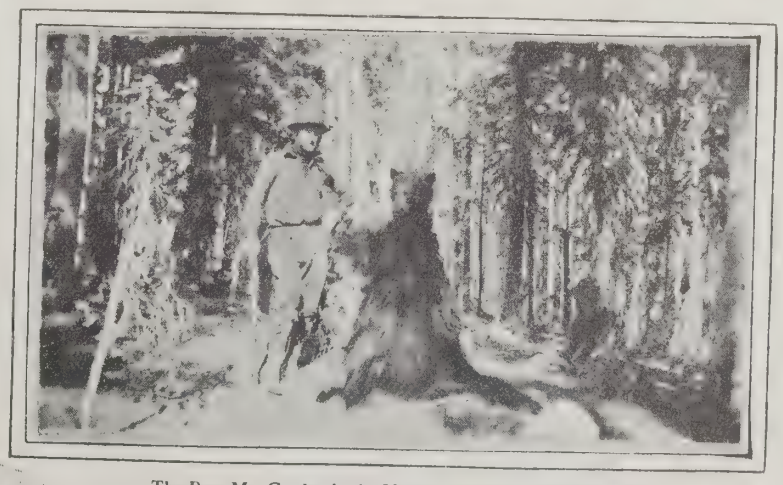
His wasn't a white-collar job with a railing in front of the pulpit, a pipe organ and a choir. The Rev. Mr. Cruden would mount his dog sled, drive miles, pull into a lumber camp, unhitch, feed his huskies at the cook-shack door and deliver his sermon across a log.

"Sometimes at meals, when the men were all gathered around, we could have a little 'song fest,' or I might be allowed to deliver a short prayer, but out in that great open country, with God all around, those men had no time for a peg with clothes on it and a lot of fine words," he said.

"They were men and had no time for any one who was not one of them. A minister had to go out and rough it the same as the natives. He had to give and take. It was a continual battle against the elements as well as the devil.

"Out 60 miles past the edge of civilization a race of men have grown up who are honest and God-fearing," continued the minister. "It is part of the unwritten law of the timberlands to respect the rights and wishes of the other fellow. The men are boisterous, yes. They talk loudly, certainly. Swear? They do, but not many times, I believe, in the way that takes the name of the Lord in vain. The men I knew at the little town of Barwick were not a bad lot. In the phraseology of the country are expressive words that are condemned in polite society, but it is hard for me to believe that a sin was committed every time a man said 'damn.'"

Not all the work done in the lumber regions was actually in the camps themselves, for the minister had a church at Barwick. When he first went there he found no parsonage, just the church. For a while he lived at a hotel. Two hundred and fifty claimed Barwick as their home. The church was a schoolhouse on week days. Later, a house was given to him. Different camps near by donated the lumber, men came for one day to assist in the erection of the framework. The remainder of the building was done by the minister himself. He painted the outside, two shades of green, hiding it among the pines that stood in the yard.



On the first New Year's night he spent in the Northland, the minister came driving across the hills and valleys on his return from assisting at a religious service some 40 miles from his home. The moon was down and the northern lights shone in the sky. His horse champed the bit in eagerness to be home, when suddenly ahead there appeared from behind a bush two balls of fire. It was the boldest of a large pack of timber wolves. The lantern on the dashboard of the cutter showed a dim form crouched, ready to spring when the sleigh drew near. A shot from a rifle killed the wolf. From then until morning the pack was kept at a distance by a large fire built of balsam branches and by glowing brands thrown at the animals when they ventured near.

Once, later, the minister was attacked by wolves, this time by a small pack, and the dogs he was driving that cold winter night saved him until he could build a fire.

Several times, while the Rev. Mr. Cruden was figuratively saving lives, both man and beast almost cost him his own. One day a lumberjack stopped at Cruden's home and asked whether the minister could be at a place on Little Rainy River which runs into Lake of the Woods, on a certain date, explaining that a man there wanted a wedding ceremony performed. The minister promised to be on hand. Two days before the ceremony was to take place the preacher loaded his dog sled and started on his journey of 70 miles through the bush. His only guide was a trail dimly marked on a piece of paper. A day and a half from home he discovered he was lost. He could tell the points on the compass, but was confused by a spot where the trail divided into what seemed to be three directions. Only two were marked on his paper. To decide which way he should go, he shook three sticks of different lengths in his cap and drew lots. He drew the wrong trail. A snowstorm that night obliterated his tracks, and for three days he floundered about in the woods before he found a camp and learned the way back home.

Meanwhile, the prospective husband had become angered at the nonappearance of the minister and started to seek revenge. At the Cruden home, the disappointed man rapped on the door with the butt of his revolver and demanded admittance when Mrs. Cruden opened the door. Forcing himself past her, he searched the house, threatening death to the minister at every turn.

Finally, he became convinced that Cruden was probably lost in the woods and so he decided to await word. The next day the minister drove up, tired, his huskies limping with sore feet from the journey. After a brief rest, he once more started out for the camp on Rainy River, this time with the husband-to-be for a guide.

The Rev. Mr. Cruden in the Northwoods and a bear he bagged.

Mrs. Cruden was with her husband one time and the two nearly met death when their horse overturned the sleigh. It was during the first freeze in the fall that they started one day for a trip down the river on the ice. They had traveled about 30 miles, when, on rounding a bend, they suddenly came upon a mother bear and a crippled cub.

On seeing the bear at close quarters and before the minister could fire his rifle, the horse bolted, overturned the cutter and fell down. Both Mr. and Mrs. Cruden were thrown to the ice. Growling, the mother bear started toward them. The minister was forced to shoot her, but he allowed the younger one to scamper off through the brush. The dead bear was thrown into the sleigh. Now its hide serves as a rug in the Cruden home.

"Would you like to return to that northern country?" the minister was asked as he sat in his study in the parsonage of the Quindaro Christian Church at Kansas City.

"Here in Kansas City," he replied, "I stand before a congregation—attentive, intelligent—and I couch my message in the best language at my command, but—

"Up in the woods I would drive miles to be at a logrolling. I would take a pike pole and go out on the booms and help the men to get the great triangular rafts to the banks where they could be anchored. It was necessary to balance on one log and push the one ahead to get the booms to shore. I cannot say that my religious messages were delivered to as many there as here, but—

"At the breaking of a log jam, I stood talking to one of the men. The topic of discussion happened to be that passage, 'Greater love hath no man than this, that he lay down his life for his friend.' Thousands of logs had been caught among the rocks. A jam is loosened only by prying on the king logs that act as the keystone in an arch. A man far out in the jam freed the right log. The entire pile surged forward and bore down. The man in the river rose with the end of a log and went off into the icy water. He who stood at my side leaped into the surging timber; he bounded from log to log in that swirling mass of tree trunks and soon was at the unfortunate's side. It was a piece of bravery such as is seldom witnessed, even in stories. Men who can survive those perils of the North are brave. My work there was not so mild as here, but—

"Religion is more easily assimilated up in those pine-pillared halls of perfumed vastness. There the works of God are more easily seen, there is more room to look at them. Mountains, valleys, trees, and muskegs, all under one great canopy, are wonderful illustrations for the book we call the Bible. I glory in my work here, but—

"Spreading religion among the knights of the crosscut saw had a glory of a kind all its own. Yet, it had drawbacks. Conveniences were not many, so after a stay of six years, during all of which I was assisted by my wife, I found that we could not remain. After all, it is merely the spirit one possesses that shapes contentment. Keeping busy, results, and tasks incompleted are the requisites—and I have them all."

Huge War Stocks Go at 50 Cents on the Dollar

Billion and Half Worth of Surplus Materials Sacrificed by Government; Prices Not Disturbed by Sales and Consumers Reaped No Benefit

By FRANK J. BRUNNER

Former Washington Editor of the *Army and Navy Journal*

DOING a business of more than $1,000,000 a week, with total receipts of $852,814,462 to January 15, 1922, on material whose known cost was $1,590,852,352, the Director of Sales has reported to the War Department a recovery on cost of approximately 50 per cent. The aggregate receipts do not include sales reported to Congress in December, 1918, amounting to $123,245,239.

The sales have been of surplus war supplies of infinite variety released from time to time with a view to disturbing market conditions as slightly as practicable. This sales policy has apparently demonstrated the ability of business to absorb tremendous stocks of merchandise and material when available at sharp reduction from war-time values as represented in cost to the government. The selling is handled by army personnel almost exclusively. There is virtually no overhead for the sales organization except for fees paid to auctioneers. In fact, the biggest bargain opportunity ever offered American business has not been neglected nor have business men ignored the inducements for taking heavy stocks. It might be well said that business has in this instance performed a public service by distributing an immense quantity of goods to consumers. There has been a great deal of what could be termed practical patriotism in the absorption of surplus war stocks, which has allowed the government to take its losses and to retrieve something out of the welter of a world conflict. A study of the details of these sales, however, would scarcely attribute practical patriotism to a section of American business which caters to the individual needs through retail trade in necessities.

Wool Sale Not Reflected in Apparel

SOME significant facts along this line are available in the schedule of sales which have a direct influence on the "ultimate consumer." Take the disposal of wool, for example. It tops all the sales, with a total of $246,514,979, which is a recovery of 81 per cent of cost. Judging from the present clothing cost to the consumer, it would seem that this high percentage of recovery had not affected the wool market perceptibly. And from all parts of the country come complaints that much that is sold as wool is shoddy, with consequent pressure on Congress to enact an "honesty in fabrics" law. In textiles, exclusive of wool, sales have been $81,772,731, or a recovery of 66 per cent. In clothing, sales of $38,732,845 represented a 30 per cent recovery. In subsistence stores, canned meats, package goods, and so on, total sales amount to $60,873,221, or 38 per cent of cost. Now, in view of the small fraction of reduced retail prices to the consumer in household staples, it is evident that the government bargains so eagerly snapped up at high percentage of original cost have had little depressing effect on the necessities which enter into the cost of living.

At the service retail stores which sell surplus goods to officers and men of the army and their dependents, the total sales amounted to $37,785,485, which is 69 per cent of cost. This recovery, taken with those for wool, textiles and subsistence, indicates that there has been general resistance to pressure toward a decline in retail prices of the necessaries for existence. Clothing, because of the non-adaptability of army attire to the civilian, is eliminated from this group calculation, which thus would tend to establish the fact that 64 per cent of government cost has been paid by purchasers of stocks amounting to the stupendous figure of $424,990,512. These stocks were of goods conducive to the comfort and health of the individual, for which the government had paid $642,227,807.

Since the purchase price represents 64 per cent of the original cost, and retail prices in these commodities have shown no appreciable tendency to fall, it would seem that there was not a great deal of patriotic impulse, practical or otherwise, in the taking of these particular bargains. In fact, the suspicion comes naturally that these stocks were bid up with the intention of "stabilizing" the existing high levels in markets wherein these goods come into competition. One is disposed to grant that appearances suggest there was something akin to combination in restraint of reducing prices generally on household staples.

Did Not Reduce Cost of Shoes

RECOVERY on leather goods, the greater part shoes, again stresses resistance to general price reduction. Seventy-seven per cent of cost was recovered in sales of $8,496,656, the government taking a loss of less than $2,000,000 on this item. These shoes, be it remembered, are in the main suitable only for roughest wear, so that even the poorer paid workers have not availed much from these shoe "bargains," while the average man has availed nothing at all. The latter is still paying 70 per cent of the high mark of war time for his footwear.

But the real feast was served in the disposal of lands and buildings, and the United States Treasury was not overworked in accounting the nine per cent realized on the investment. Land and buildings sold by the War Department for which $239,071,763 of taxpayers' money had been paid is shown in the schedule to have brought $22,022,575. In addition, $6,370,075 was received under this heading for properties whose cost has never been ascertained. The real estate specialist (or should he be termed "realtor"?), therefore, had a pleasant time with a little money, and he has a pleasanter prospect before him of turning that little over many times in resales. The lumber dealers must also be a gratified lot, for they have had profitable picking. An instance was the sale of 1,200 buildings at a western camp to a wrecking concern for $251,000, or about $209 each for structures ranging in size from barracks accommodating 150 men to substantial administration offices that put many a county courthouse in the shade.

Land values have seemingly been "stabilized" only on the side of the individual purchaser who must live on the land, and he will pay as usual, while lumber prices mount higher and still higher and the high-grade second-hand stock from army camps and stations has not a bit of depressing weight on this rise. Building materials and utilities, new goods, have realized only 40 per cent on a cost of $12,620,802, which would indicate a favorable turnover on resales as new to the consumer. For hardware, the return was 35 per cent, with sales amounting to $3,454,116 and a cost of $9,797,459. Animals, too, have been at premium with 60 per cent return in sales of $22,059,627, as against a cost of $36,672,149.

In analyzing the chart of sales one cannot escape the significance of the high percentages of returns from purchases of great quantities of goods rated as necessities on the one hand, and the low return on new goods in condition to be sold as first hand, as also the meager income on realty, such as admits of parceling out in small subdivisions to a great number of individual purchasers. Is it footless to give credence to the suspicion that therein is shown a combined attitude in certain lines of business to maintain the high levels of war-time prices for as long a period as this pressure can be maintained?

Collusion Among Bidders

THE sale of the entire surplus of canned meats—corned beef, corned beef hash, roast beef and bacon—offers some confirmation of sharp practices among bidders. In this sale two Chicago concerns submitted exactly the same bid, $4,781,823, and two other Chicago concerns offered $4,482,559 and $4,303,840, respectively, while an Atlanta firm edged in between with a bid of $4,537,308. There is no evading the appearance of collusion here. However, an "understanding" was successfully defeated, because a Philadelphia company submitted a bid of $5,316,276, less expense of sale. This stock amounted to 119,000,000 pounds, so that the return per pound was a fraction above four cents. Canned meats, in large containers, never have had a wide sale in the United States, consequently the return may be considered fair. The government, moreover, did the purchaser a service of inestimable value in that the story of the offering of this stupendous supply was told in every city and town having a population of 2,500 or more and a daily newspaper. Public officials, chambers of commerce, civic and fraternal organizations were enlisted in the advertising of the sales, with the result that more than 80,000,000 pounds of canned meats were fed into marketable channels, where the value of the meats has now been firmly established and a steady demand created.

Tractors Bring Best Prices

OF MATERIALS consumed in manufactures, the return to the government on sales has been on the whole equitable; in fact, the disposal of certain material, such as brass cartridge cases and smokeless powder, was an example of good salesmanship coupled with a policy of fair distribution. For example, the initial sale of brass cartridge cases was made to three Connecticut firms at a percentage of the market price adjusted monthly. The government received 42½ per cent of the average market price for electrolytic copper, plus 19½ per cent of the average market price for prime western zinc for the month in which deliveries were made. The remaining surplus of nearly 15,000,000 pounds of brass cartridge cases was later allocated to nine firms at the same price and on the same terms as the sales to the Connecticut firms, a return which figured in excess of the highest bid rejected at the initial opening of bids in February, 1921. In disposing of 28,000,000 pounds of smokeless powder at one-half cent a pound, the purchaser bound himself to pay 60 per cent of the net return to him if this material was resold or reworked and sold for use as smokeless powder.

In terms of percentage of recovery on many materials, whose known cost was $1,590,852,352, the following will prove illuminating as an indication that wide-open markets exist in the United States which are ready to absorb goods at favorable prices:

Airplanes and equipment, 22; artillery and ammunition, 69; chemicals, acids, explosives, 90; electrical equipment, 58; ferrous metals, 21; non-ferrous metals, 47; fuels, 47; hardware, 35; lumber, 44; machinery and engineer equipment, 50; motors, miscellaneous vehicles, equipment, 15; non-metallic scrap, 3; office and household equipment, 54; oils, greases, and so on, 51; packing containers, 23; railway materials, 65; railway rolling stock, 87; ships, barges, floating equipment, 31; small arms and ammunition, 83; trench warfare materials, 42; tractors, 92; unclassified, 10.

Of materials listed as cost unknown the sales have reached a total of $77,140,849—the items in this list, each representing more than $1,000,000 in returns, being ferrous and non-ferrous metals, building materials and utilities, chemicals, acids and explosives, clothing and equipment, electrical equipment, land and buildings, lumber, machine tools, non-metallic scrap, textiles other than wool, and unclassified materials. Under pressure of the war emergency and hastily drawn contracts, it probably was unavoidable that actual cost could not be even estimated in many of these lines.

With utilities which the government could not operate in peace time, disposition was generally on favorable terms, as instanced in the equipment formerly operated by the Inland and Coastwise Waterways Service on the New York state barge canal. The sale at $1,000,000 of the entire equipment was on a deferred payment basis over a period of seven years, $275,000 to be paid by July 1, 1922, and the remainder in equal monthly installments, all deferred payments bearing interest at five per cent. The government also is protected by insurance of the vessels by the purchaser and by bonds to cover maintenance.

70,149 Motor Vehicles Disposed of

IN ADDITION to actual sales, army surplus material costing the government $209,620,147 had been transferred to other governmental departments up to September 30, 1921, when transfers ceased. Of this amount $138,290,529, or nearly 66 per cent, was transferred to the Department of Agriculture, all but $10,619 of which was without funds. The Navy Department and Marine Corps received $25,653,369 worth of material; the Post Office Department, $16,261,829; Interior Department, $15,407,361; Treasury Department, $10,294,557; Department of Commerce, $3,470,823, and Department of Labor, $44,053. Motor and miscellaneous vehicles transferred represented a cost of $118,264,808. The transfer of serviceable motor vehicles was required by law and only unserviceable cars not desired by other departments were offered to the public at auction sales. Fewer than 17,500 unserviceable vehicles, including trailers and bicycles, have been sold. More than 53,000 used motor vehicles have been transferred to other government departments, 36,561 of these to the Bureau of Public Roads in the Department of Agriculture, which is making good use of them in improving the highways and making back country farms more accessible. A total of 70,149 motor vehicles of all kinds has been disposed of by the War Department.

The amount of surplus property remaining in the possession of the War Department is estimated to represent a cost of approximately $160,000,000. At the present rate of sale of some $1,110,000 a week at 50 per cent of cost, the selling organization under the Director of Sales probably will continue to function for several years to come, for additional material is constantly being declared surplus, and it is likely that laws will be enacted requiring the disposal of material now held for use in a future emergency.

The War Department is speeding up on sales by public auction; a series of 11 during six weeks have just been held in different sections of the country from Ohio to California. The movement of goods is, therefore, constant and activity is promised to seekers after bargains for some time. It is only just to point out that the War Department has handled this enormous selling proposition with judgment and adherence to a policy of equity, and that it deserves to receive commendation for disposing of nearly $2,000,000,000 worth of surplus stock for $852,814,462 and for the distribution to other governmental agencies of transport and other equipment which cost more than $200,000,000.

Seek Camps as Sites for Parks

IN CONCLUSION, an incident which shows that historical sentiment is strong among the people will not be amiss. The Secretary of War reported to Congress a list of government-owned military reservations and coast defenses not considered necessary for present or future military purposes. There was an immediate descent on the Secretary of War by state and civic societies that desired to purchase sites of historic interest. It was necessary, to check the demands for sales to competing organizations, for the secretary to issue this public statement: "In disposing of this property the locality or community concerned will, in each case where practicable, be afforded an opportunity to secure the site, and special consideration will be given to the desires of the community where such property is of historical interest. Before the War Department can dispose of this real estate it will be necessary for Congress to enact legislation authorizing such disposal, and until such laws become effective the War Department can take no action in the matter of its disposal."

Civility—Gone for Good?

By FRANK DORRANCE HOPLEY

INCIVILITY, indifference, frivolity, and not infrequently outright lawlessness are today regarded by many as signs of independence, preferment and general superiority. These people, as a rule, are not only unwilling to observe the ordinary social properties, but also to concede to others those attentions and considerations they insist upon exacting for themselves.

In New York City, incivility has become so marked that a campaign to promote "Civility," is being conducted by the Fifth Avenue Coach Company, which operates a line of motor buses.

On the top of each bus is a large sign bearing the one word, "Civility." Soon after it appeared passengers began to ask questions. A pamphlet is handed the questioner by the bus conductor, and this pamphlet explains the campaign.

In this literature many pertinent questions are asked, as:

"Have petty jealousies, partisanship, egoism, sectionalism, blinded us to that high plane of political thought and humanitarianism to which our forefathers ascended?

"In some of the more modern and progressive features of our educational system, may not some of the contributory causes be identified?

"Is the average child of today as respectful of his or her parents and elders as the child of 15 to 20 years ago?

"Is the elementary school boy or girl of today more rudely precocious, and the advanced student more stubbornly self-sufficient and self-opinionated than those of a decade or more ago? If so, why?

"Has the youth of today that same genuine, wholesome respect for age and gray hairs that the youth of a decade ago exhibited, or rather, practiced as a matter of course?

"Does the female of the species command from her contemporaries of the opposite sex those same chivalrous considerations and attentions that were bestowed upon her a few years back?

"Is there today a greater tendency toward emotionalism, toward that strangest of human maladies, hysteria, than there was 10 years ago?

"Has the average person developed greater self-indulgence in things physical, to the neglect of things mental and spiritual?"

To bring home more forcibly the fact that incivility is rampant, the coach company has taken from its records, instances of vilification and abuse of its conductors, by some of the riding public. These incidents, it is stated, exceptional as they may seem, occur often enough to be called common. Here are just a few:

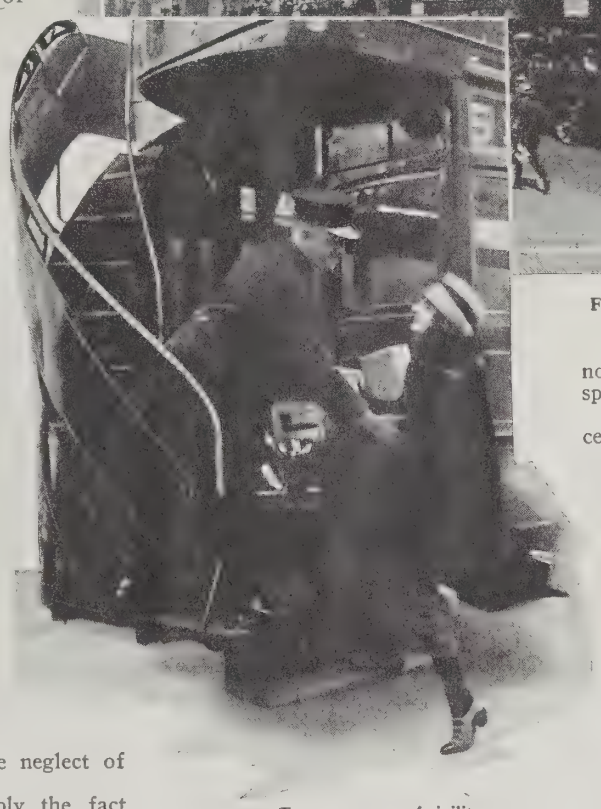
"A young man, desiring to get off a bus at Fifth Avenue and 104th street, did not ring the bell soon enough to allow the driver to stop immediately at the corner; rather than jar all the other passengers and put unnecessary strain upon the bus, the driver stopped, approximately, 40 feet toward the middle of the block. Enraged, the youth turned about as he alighted and deliberately spat in the conductor's face. Two men among the passengers jumped off the bus, seized the youth and were about to administer the beating that he deserved, when an inspector of the company, who happened to be near, saved him from harm."

"A woman boarded a bus at 110th street, fished around for several minutes in her handbag, then offered the conductor a dirty, crumpled transfer four days old. The conductor politely called attention to the date on the transfer, and refused to accept it. The woman then kicked him in the shins so violently that he suffered from the effects for several days."

It would not seem possible that such things could occur in these days when civilization is supposed to be at its zenith. These incidents, however, the coach company declares, have been duly investigated and verified.

"A prominent business man, passing down Broadway in a bus, wanted to alight at Sixty-fifth street. He did not ring the bell until actually in the middle of that cross street. When he saw the bus passing his corner, he angrily struck the conductor on the jaw. The force of the blow knocked the conductor down and he fell behind the stairs. The company prosecuted the conductor's case vigorously; the business man went to the conductor's home and apologized, besides making other restitution."

"A woman wrote the company threatening to use a hat pin on every menial who presumed to touch her arm or glove in assisting her on or off the bus."



But the onus is not always on the patrons of the buses. While, perhaps, the majority of the operatives are courteous to the extreme, almost painfully so since the civility campaign began, there are many on whom wings have not as yet begun to sprout.

View on top of a bus. The conductor is saying, "Thank you."

Fifth Avenue, New York, showing "Civility" signs on buses.

Two exponents of civility.

"Complaint was received that one of our oldest conductors, a man noted for his courtesy even before the company started its civility campaign, had used indecent and insulting language when the young daughter of a prominent minister asked him a civil question. Investigation verified the complaint, but it also brought out the possibly mitigating fact (which to the author of this article seems no excuse at all), that this conductor had been abused by passengers no less than seven times that day, three of the attacks occurring on the same trip as that in which he turned, somewhat like a friendly dog, goaded gradually to madness, on the cultured, inoffensive girl."

But for pure, unmitigated "nerve," the following incident, contained in a recent report of a bus conductor, ought to be awarded a medal. The report reads:

"A lady, today, stopped the bus and, putting her foot on the step, leaned over and tied her shoe. Then, she thanked the conductor, and walked away."

The civility campaign has met with a wholesome response in some quarters of New York and even more noticeably in other cities where newspapers and periodicals have taken up the discussion. Organizations of varied character have modeled campaigns after that begun in New York. The pamphlets entitled, "To Promote Civility" have been sent to thousands of high schools and colleges, and distributed by the teachers among their pupils. Hundreds of letters have been received by the coach company praising its efforts, and promising the support of the writers in a nation-wide campaign.

The Fifth Avenue Coach Company is now offering $1,000 in prizes for the best essays on "Civility" in any of its varied forms.

The pamphlet on "Civility," in its closing paragraphs, makes this appeal:

"Much has been said, and is being said these days about 'reconstruction'; and greatest importance is attached to the necessity of reaching some common ground for the prompt adjustment of existing differences between labor and capital.

"But how are we going to adjust these differences satisfactorily before 'reconstructing' the individual? If we can bring about, through the teaching of civility, a more wholesome regard and respect for one another and the proprieties of so-called intercourse, would it not be a long step toward reaching a just and amicable adjustment of whatever differences may exist?

"How often have misunderstandings between labor and capital been due, on the one hand, to diffidence and disinclination of the men to approach employers because of a feeling of intellectual inferiority, little knowing the efficacy of good manners and politeness as a lubricant to smooth the course of such meetings; and, on the other hand, to absolute intolerance on the part of employers, with a display of ill manners and discourtesy which, in many cases, rather than being intentional, was due to embarrassment if not ignorance?

"When men come together, unbiased, unprejudiced and with a will to be fair, seldom do they fail to reach an agreement. If, through thinking of civility, we gain an increased respect for one another, we shall soon inculcate a feeling of greater trust, patience, tolerance and brotherhood by teaching others to 'try civility.'"

Bootlegging in Humans Across Our Borders

Concluded from page 2

viséing passports for that entire country. It will be his duty to cease issuance of passports for prospective immigrants, at the time the quota is exhausted. Unofficially, it is probable that he will be required to use his good sound discretion in determining to whom passports shall be issued.

Therefore, without provision of law, the consul will become a vastly important official. He will be the man to determine the time of the expiration of the quota of each nation. It seems reasonable to suppose that he can quietly minimize the percentage of extreme undesirables.

The probability that alien selection would become the province of the sound judgment of the consul has been growing. The first to sense its coming were those very elements which have resisted, most strongly, restrictive legislation of every character. These elements are determined to have a consul of their own selection in the great centers from which the European undesirables flow. It will lie with the administration to see that the American consular service is restricted to men jealous of American traditions, and free from alien influences.

The impracticability of general deportation is one of the obstacles faced in connection with the framing of a general immigration law. Secretary Davis has recommended the enactment of a law for the registration of all aliens in the country. He favors registration four times a year.

Various estimates give the number of aliens in the United States as between twelve and twenty millions. About six millions are naturalized.

"They must show me how a registration law may be effective before I support it," said Congressman Johnson. "It will require a huge force of men. Then there is the question of what we can do, if we discover large numbers of persons illegally in the country. The few hundreds we do find and order deported cause sufficient trouble. Before deportation, we must obtain the consent of the country to which we are sending the undesirable. If there is a doubt as to the residence the foreign country will not accept an undesirable.

"It is quite possible that a general registration would disclose thousands of aliens illegally in the country. What could we do with them? The foreign countries would probably not take them in wholesale numbers. Ellis Island would not hold them. We haven't jails enough in the country to keep them in."

Whether the registration law will be passed is doubtful.

Immigration committee members, however, are confident that ultimately in the slow process of congressional action, a permanent immigration law will be enacted, remedying the "alien bootlegging" from Canada and Mexico, clearing up doubtful interpretations of the law, providing a smaller and more regular immigration, and finally providing in some way for selective viséing of passports by United States consuls.

WILLIAM E. B. DU BOIS,

Negro educator, who asks the people of the nation to recognize the Negro, if he makes good.

Struggles of the Black Folk

Leader Tells What Must Be Done If Race Problem Is to Be Solved

By FRED L. HOLMES

"SOLUTION of the real Negro problem in the United States is to be determined by the attitude and ideals on the part of the American whites. Do they, or do they not, believe that there can be a great republic with citizens of various races, including the black race? If they so believe, and that policy and attitude becomes fixed and recognized, the Negro problem, though difficult, will find its solution."

William E. B. Du Bois, probably the recognized educational leader of the colored race since the death of Booker T. Washington, gave this as his opinion. He was born just after the close of the Civil War at Great Barrington, Massachusetts, and is of Negro and French descent. He was educated at Fisk University, Tennessee; at Harvard, where special honors were given to him, and at the University of Berlin, Germany. He has devoted his life to a study of the race problem. There have been days of discouragement; times of humiliation. The first real shock of his life came when he discovered that he was within the Veil.

"I remember well when the shadow swept across me," said Mr. Du Bois in recounting this experience. "I was a little thing, away up in the hills of New England, where the dark Housatonic winds between Hoosac and Taghkanick to the sea. In a wee wooden schoolhouse, something put it into the boys' and girls' heads to buy gorgeous visiting cards—10 cents a package—and exchange. The exchange was merry, till one girl, a tall newcomer, refused my card—refused it peremptorily, with a glance. Then it dawned upon me with a certain suddenness that I was different from the others; or like, mayhap, in heart and life and longing, but shut out from their world by a vast veil. I had thereafter no desire to tear down that veil, to creep through; I held all beyond it in common contempt, and lived above it in a region of blue sky and great wandering shadows. That sky was bluest when I could beat my mates at examination time, or beat them at a foot race. Alas, with the years all this fine contempt began to fade; for the worlds I longed for, and all their dazzling opportunities, were theirs, not mine. But they should not keep these prizes, I said; some, all, I would wrest from them. Just how I would do it I could never decide; by reading law, by healing the sick, by telling the wonderful tales that swam in my head—some way. With other black boys the strife was not so fiercely sunny; their youth shrank into tasteless sycophancy, or into silent hatred of the pale world about them and mocking distrust of everything white; or wasted itself in a bitter cry, Why did God make me an outcast and a stranger in mine own house? The shades of the prison house closed about us all; walls straight and stubborn to the whitest, but relentlessly narrow, tall and unscaleable to sons of night who must plod darkly on in resignation, or beat unavailing palms against the stone, or steadily, half hopelessly, watch the streak of blue above."

Surprising Advance in Thrift

IN CONSIDERING the Negro problem there are two viewpoints. First, there are those who believe that the emancipation of the Negro, the giving to him of equal rights and equal opportunities depend on what the Negro can accomplish. The second group takes the position that it doesn't make any difference what the race may accomplish, there are and must always be a part of the great race of mankind, "who are going to be dominated by the white races, if not forever, at least for an indefinite length of time." It was to get his attitude as a leader of his race that I interviewed Mr. Du Bois.

"How can the Negro problem be solved?" I asked.

"It is unsolvable except in two ways," replied Mr. Du Bois. "First, the separation or the subjugation of the black race to a place of permanent servitude.

"Second, the judging of a race and a people on the merits of their accomplishments. If the people of the United States admit, and the major part of them do, that if you have intelligent and efficient human beings, a republic can be established despite the fact that some of these beings are of African descent and others of Spanish descent, then there comes the world-wide problem of how you are going to make efficient citizens of that part of the population which is poor, and ignorant, and disadvantaged in many ways because of their past history and present surroundings. This is a difficult problem, but no more difficult than the same problem with regard to other groups of mankind.

"The Negroes of the United States, for instance, are ignorant as a race, but they are not so ignorant as the people of some European countries. They are poor, but a generation removed from slavery would naturally be poverty-stricken. But the advance and savings in thrift and accumulation of property among the American Negroes in the last 25 years has been one of the astonishing records in modern days, and it has been accomplished in the face of peonage and discrimination.

"The question of general social efficiency is largely a matter of experience and contact. In the last 20 years I have visited every state in the Union and I suppose there isn't a single large group of Negroes that I have not met. Of course, sometimes, casually and for only a few hours, in other cases with long residence and intimate acquaintance. During the same time I have known, fairly well, groups of white people throughout the United States and in England, France and Germany. I have not in my mind the slightest doubt but that the advance in efficiency in the knowledge and conception of modern civilized life has been as great, if not greater, among American Negroes, than among any other group that I know of, and I do not see any reason why they should not in time become the equals of modern men.

He Realizes Problem Is Difficult

"THE Negroes have had the right to vote and have exercised it in some parts of the United States for more than a generation. They have in that time made all the mistakes of new voters, and yet, on the whole, it has been possible to count them with the supporters of the government. There is no reason to doubt that the granting to American Negroes of their franchise, hedged about by restrictions as to illiteracy and perhaps other things that are applied to other citizens, they could easily become reliable and efficient American citizens.

"I do not mean to say, by any means, that these problems of poverty and intelligence and voting and social efficiency in general, with the necessary problems of crime that always come among poor and ignorant people, are not difficult problems. I do not mean to say, that they are going to be settled in a short time, but I do say that they are no more difficult than among groups of other people in the world, similarly poor and ignorant, and that the difficulty with the United States is that instead of attacking these problems with determination and good faith, it has continually hesitated and halted, because of the first problem I expressed, namely, the question as to whether they wanted, or would accept, efficient black citizens under any circumstances."

Education Denied Them, He Asserts

"WHAT can be done to solve the Negro problem? What should the government do? Should Negroes have the right to vote? What is your program?" were among the questions I asked Mr. Du Bois.

"If we assume that the people of the United States are going to accept the Negro as a citizen, provided he comes up to the average efficiency of the citizen, then there are three main policies that must be carried out and we must begin with them immediately," he responded.

"First, as to education. We have had a great deal of discussion as to the kind of education the Negro should have, forgetting the fact that in the meantime, as a race, they aren't getting any education. It has been shown by recent government reports that the white child of the United States is having between $10 and $12 a year spent on him in the public common schools. This is an inadequate sum, but it is munificent compared with the amount that is spent on the Negro child, which is an average of $2.50. This means that tens of thousands of white children and hundreds of thousands of Negro children are growing up without an education.

"What is needed, then, is national aid to common-school training distributed among the states equal to the size of our illiterate population. This the Stirling-Towner bill in Congress provides for. Unfortunately, this bill does not provide that the national funds shall be distributed equally between all children of school age, but permits the southern authorities to discriminate as much as they please in favor of the white child against the Negro child. This bill in its present form, instead of removing ignorance, would perpetuate it among the least efficient group, and in many ways would accentuate the race problems of the South. What is needed is national aid in common school education without race and class discrimination.

"The next step is one toward the elimination of poverty among Negroes and this should begin by enforcing the Thirteenth Amendment. Most Americans do not realize that of the 8,000,000 Negroes of the South, at least a third of them are held in practical slavery on the large plantations, and this is not an exaggeration. It is silly to preach to the Negro that he should stay on the farm, when staying on the farm means practical slavery and perpetual poverty. What is needed is a campaign on the part of the United States and state authorities to break up the system of peonage.

"Outside of peonage, there has been a determined effort on the part of employers to build up in the South competing groups, black and white, which could be depended upon by their competition to keep wages down. The white working man in the South is afraid to make demands lest he be displaced by cheap Negro workers, who on the other hand find the only way to make bread and butter is by underbidding their white competitors. The result is the intensity of race feeling, the determination of the white laborer to keep the black man from voting and the increase of lynching and mob violence.

Would Abolish Borough System

"THIS situation can only be cured by action on the part of white unions recognizing black men as fellow workers, entitled to just or equal wages and a realization on the part of the American Negroes of the meaning of the modern labor movement.

"With regard to voting, immediate steps should be taken to establish a democratic government in the United States by uprooting the present borough system. Today the basis of representation in the United States depends upon its population, white and black, but with the black men in the south deprived in most cases of the right to vote, the white men come to the polls with anywhere from two to five ballots in their hand as compared with a northern voter. The result is that the political power of the South is equally and dangerously over-emphasized in the council of the nation. The part of the nation where lynching and mob violence is most; where homicide is most frequent; where illiteracy is greatest; where the protection of women and children is smallest; which, in fact, by every measurement of modern civilization, is most backward; this part of the United States has an overwhelming influence in the national council.

"This situation can only be cured by insisting that the laws as to voting be carried out equally with regard to all citizens. If the South wishes to restrict voting to those who can read and write; or if it wishes even to go further and put other restrictions on the ballot, they have the right to do so. After that, they should be compelled to carry out their laws without discrimination among all the citizens. This would give the Negro a voice in the taxation of his property, in the education of his children, in the passage of laws which he has to obey and in the policies of the state and national government.

"The practical steps for accomplishing this would not be difficult. It could easily be arranged to carry out the provisions of the Fourteenth Amendment and to cut down the ratio of any state which persistently disfranchised a group of its citizens. If the state wishes to go on with its representation cut down, at least its power for harm and prejudices would be curtailed. No state would submit to this. It would want its full power and it could only get it by giving every citizen a right to vote."

Pleads for Their Recognition

FROM city to city; from educational institutions to state universities, and from state to state, Mr. Du Bois is traveling, delivering his message and asking for greater opportunities of development and recognition for the American Negro. He is the editor of a little magazine, *The Crisis*, that is voicing this reform. He is the member of a national organization for The Advancement of the Colored Races that is preaching these doctrines. Since the death of Booker T. Washington he probably is the most effective force in the fight for reforms in behalf of the colored people.

Through the publication of his book, "The Souls of the Black Folk," by his novels, "Quest of the Silver Fleece" and "Dark Water" he is waging his battle for recognition; attempting to stir a lethargic public opinion.

"Surely there shall yet dawn some mighty morning to lift the Veil and let the prisoned free," he mused as he rehearsed to me the story of the struggle. "Not for me—I shall die in my bonds—but for the fresh young souls that have not known the night and waken to the morning; a morning when men ask of the workman, not 'Is he white?' but 'Can he work?' When men ask artists, not 'Are they black?' but 'Do they know?' Some morning this may be, long, long years to come. But now there wails on that dark shore within the Veil, the same deep voice, 'Thou shalt forego!'"

"I'll Wait Till They Sweat Blood"

Concluded from page 8

Paso. They dominated the cotton belt west of the Mississippi River. Gould trains crossed the Rockies, passed through the scenic country of Colorado and rose into the mining camps of Utah. Now an embargo, as grim and relentless as a Chinese wall, had been placed on all this traffic westward.

The situation spelled disaster for the Gould lines unless the railroad builder hastened with the construction of his new road to the coast. Harriman had the advantage of the three years which this enterprise would take for its completion. Haste, haste was incumbent upon Gould to relieve the pressure westward experienced by the Missouri Pacific system and its kindred and affiliated lines; haste, before further obstacles could be placed in his path, before Harriman had monopolized all the business of California. The Western Pacific must be built on record time.

And Gould had a terrible problem before him. A desert and two mountain ranges had to be crossed to carry his 1,000-mile road to its goal.

Jeffery, now Gould's lieutenant in the West, went to Utah, and along the southern shore of Great Salt Lake he began his stupendous task of constructing the western end of the Gould system. He was now the president of the Western Pacific, and one of the leading engineers of the country, Virgil G. Bogue, had been made the company's vice-president. These two men struck out for Wells; Nevada, across the Great American Desert. The laying of rails in the desert spelled great hardship for the workmen, owing to the lack of water, although a 40-mile pipe line had been laid from springs in the mountains and pumping stations had been established along the course of the projected line.

Jeffery and his engineer then crossed the lines of the Central Pacific, and reaching Winnemucca, they struck due west. Now began the work of facing the Sierras. The man who had built the Denver road gathered his forces to blast his way through the tremendous walls of rock that barred his passage. Predictions were made that the Western Pacific would never work its way through the mountains, that its resources would give out and the enterprise would die of exhaustion in Nevada, probably to be taken up in later years by other hands.

But while Gould's lieutenant was walled up in the mountain passes, surveying parties descended from the coast ranges of California to obtain the right of ways for the road. Here they were met by the corps of Harriman. Guards held the roadways, crossings and water courses, defending Harriman's California empire against the invaders from Nevada. Filled with the spirit of the free West, the opposing bands armed themselves and peppered one another with shot.

This militant opposition was organized to delay the building of the main line while the opponents of the enterprise had recourse to the courts, for the Southern Pacific made a move that apparently prohibited the Western Pacific from gaining an entrance into San Francisco. Its representatives went to the Circuit Court with a claim to a section of land on the Bay of San Francisco at Oakland, and the judge decided in their favor. This legal victory gave further rise to prophecies of the impending collapse of the Western Pacific project.

Along the banks of Oakland Creek the disputed land was fought for by opposing cohorts. Camps of the rival companies presented the appearance of army outposts. Armed men picketed the territory, while launches fitted with searchlights guarded the creek. Undaunted by efforts of the Southern Pacific interests to prevent the new road from obtaining a terminal for its tracks, workmen of the latter continued to lay tracks to the contested strip. With loaded rifles, they guarded the ties and rails already put in place.

Haste, haste, was still the Gould motto. Time pressed. The Harriman forces were gaining a firmer and firmer hold on the traffic of California and the trade of the Orient. The Gould lines were suffering sorely. Every known means of effort, and material of the latest design were employed to speed the work. Money was poured out in expenditures at the rate of $1,000,000 to $1,500,000 a month. The West was scoured for workmen. Seven thousand of them were employed on the line between Salt Lake and San Francisco, and nearly 3,000 of that number were working on the stretch from Oroville up to the Feather River and the western slope of the Sierras.

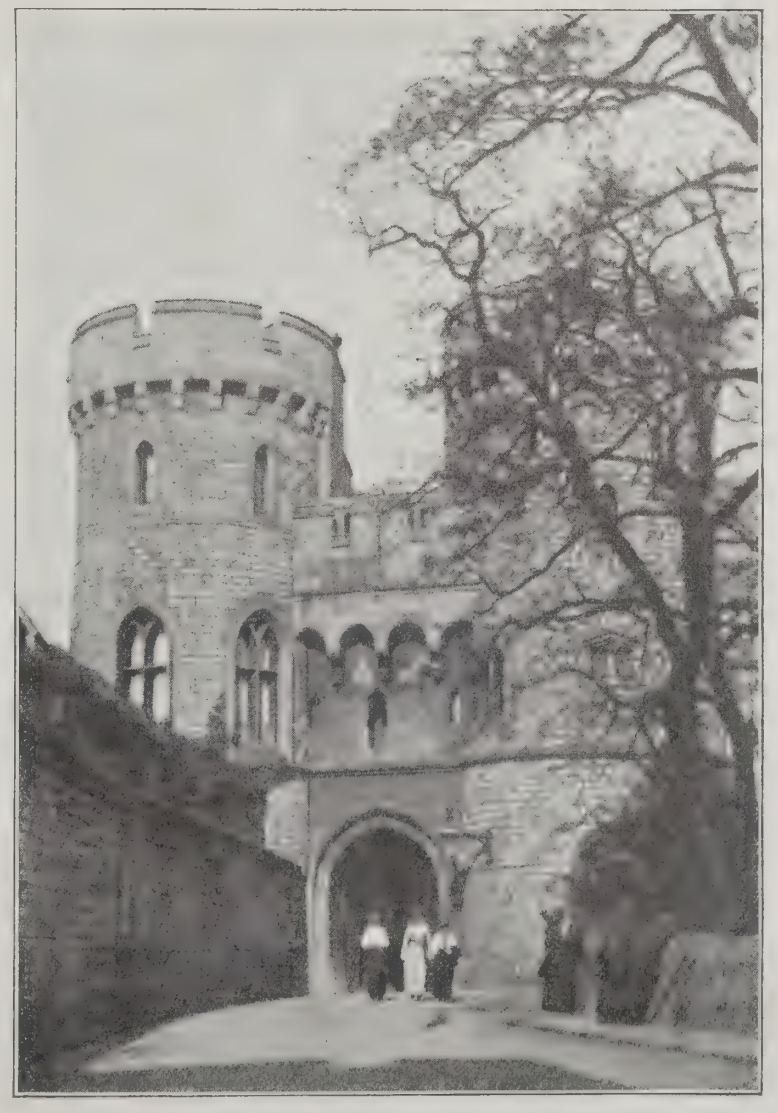
Gould was sanguine of success. But he was yet to learn that he was facing not only the hostility of men, but the unconquerable forces of nature and the terrible menace of money crises. Came the earthquake at San Francisco, which shook California, wrecked the terminals of the railroads and the lines of trackage along the coast. With J. C. Stubbs, his traffic manager, Harriman sped toward 'Frisco in the fastest trip he had ever made. He foresaw the future, and with his accustomed energy, he gained an opportunity to acquire additional and valuable terminal facilities for his roads.

Nor did the earthquake make Jeffery falter. "My faith in the future of the Western Pacific," he said, "is just as strong as it was before the disaster. The soil of California is as fertile as it was before the earthquake, the mines are as productive and the forests as rich in timber." The man from Denver stuck stubbornly to his work, blasting his way through stone fastnesses. Haste, make haste! It was never more needful. The Western Pacific had won back its terminal property through a decision of the courts, but the enemy was now in a stronger position in its California entrenchments.

Next came the Rich Men's Panic, when corporations failed and Wall Street shivered and shook. But in the mountains, Jeffery was boring his way through 43 tunnels. The Beckwith tunnel, giving on to the eastern slope of the Sierras into Long Valley, was 6,006 feet long. The great Flower Pass tunnel, from whose eastern end the road dipped down into the Great Salt Lake Desert, was a mile in length. Forty steel bridges were constructed as fast as the material arrived.

The end of the three years came, and saw Gould's prediction unfulfilled. But the frantic work went on. Tunnels were driven with every man that could work on them, and with every appliance known to modern engineering and mechanical skill. For some of the months the amount of work done exceeded the labor accomplished in the same time on the Panama Canal, where more than 30,000 men were employed.

Again there came a repetition of unforeseen conditions that retarded the railroad's completion. Long-continued rains in the mountain districts destroyed miles of roadbed; unprecedented floods in the Humboldt Valley swept away the tracks, and a series of storms on Great Salt Lake, the level of which was higher than it had been in 20 years, wrecked portions of the railway line along its shores.



But pushed ahead by Jeffery and Bogue, the Western Pacific passed through storm and earthquake, through hardships and panics and survived. The Denver & Rio Grande men had won though Harriman had died long before they had driven the last spike.

What has been termed one of the most notable engineering examples in the world for uniformity of low grades and elimination of curvature had been completed. Another truck line had been brought into being to develop the country's trade, to carry its products to the Pacific and send eastward the riches of the West.

But even as the first through trains of the Western Pacific were crossing the Sierras, a group of financiers met in a large banking house within a stone's throw of Wall Street. The room in which they assembled is said to be the most magnificent in the financial district. Its interior decorations were designed by a famous artist. Here plans were developed for wresting the new railroad from the hands of its builders. And the scheme succeeded!

The Denver & Rio Grande had for years made enormous sacrifices to construct its branch line to the coast. But this banking group now tore the Western Pacific from its ownership, and made the property their own. They did more. They took even the Denver & Rio Grande from the hands of its owners, and strange though it may seem, they made it the subsidiary of the line it had built. And then at one stroke, they blotted out of existence $87,000,000 worth of Rio Grande stocks in which the public had sunk its money, with the ease that a school boy might observe in sponging the figures from his slate.

How was it possible for them to have accomplished their design? That story is yet to be told, and it will appear in an early issue of this magazine.

The architect of the University of Chicago visualized Tennyson's line, "The splendor falls on castle walls."

Saturating a Commonwealth With Electricity

Concluded from page 3

facilities brought the conviction that Niagara power would soon be exhausted. Ten years ago Ontario experts expressed the belief that all the Niagara power, available under existing conditions for use in the province, would be gone by the close of 1921.

Facing this condition, they set at once to the task of providing a new source of power. Instead of looking elsewhere, they looked to Niagara itself. They saw that fully half the power available was going to waste.

The fall of water from Lake Erie to Lake Ontario is 327 feet. But Niagara Falls proper is slightly less than half that height. As power is proportional to the waterfall height, development had been confined almost exclusively to half of the total fall between the two lakes.

The Ontario Hydro-Electric Power Commission bent its efforts to utilizing this lost fall of water.

On December 28, 1921, these efforts culminated in the formal opening of the newly completed Queenston-Chippawa power canal.

This canal permits the taking in of water from Niagara River at Chippawa above the Falls, the conveyance of this water twelve and three-quarter miles around the Falls, and its discharge through pipes down 305 feet of cliff at Queenston in the lower Niagara River.

The largest power plant in the world has been built at the foot of this cliff, to transform this gigantic artificial waterfall into power.

The initial development of power due to the canal will be 275,000 horse power, a complete canal installation will permit a capacity of 550,000, and ultimate capacity of 650,000. With other power resources at the natural falls, approximately 1,000,000 horse power will be available ultimately.

Treaty regulations between the United States and Canada restrict the amount of water either country may divert from the Great Lakes. The Queenston-Chippawa development program was the Canadian engineers' solution of the problem how best to utilize the maximum amount of power available. This amount is twice that possible from the natural falls alone. The 305-foot artificial waterfall utilizes all except 22 feet of the total fall between the two great lakes. Of this 12 feet, 10 feet occur in the upper river above Chippawa, and 12 are necessary to convey the water through the canal.

In twelve and three-quarter miles a total excavation of eleven million cubic yards of earth and the hewing out of four million cubic yards of solid rock was necessary. At one point a cutting into earth was made to the depth of 80 feet. In rock at one point the depth of 85 feet was reached. The width of the rock-cut portion of the canal is 48 feet.

Engineering difficulties met and conquered by the canal builders were many. At the intake end the engineers had to consider and meet the problem faced by the annual formation and flow of ice, a particularly aggravated one because the large floes which form on the shores of the comparatively shallow Lake Erie are all discharged through the river each spring. It was only after a long series of experiments that an intake was designed able to keep the plant free from ice.

At the other end of the canal, where it enlarges into the forebay, a triangular concrete structure has been erected to act as a diffuser to smooth out any turbulence in the water as it enters the bay.

Across the lower end of the bay extends the permanent screen house structure, built of reinforced concrete and forming a dam across the forebay. This structure contains the molded entrances to the penstocks or pipes which convey the water down the cliff to the turbines, and which form in effect a 305-foot artificial waterfall.

At the foot of the cliff, the building which houses the generating and transforming equipment will, when completed, be 650 feet in length, while the roof will be 160 feet above the river level.

Not only is the power house the largest in the world, but equipment of all sorts is in proportion. The turbines, with 60,000 horse power capacity, are the largest ever built. The generators, two of which already have been installed and three of which are in the process of manufacture, are the largest and heaviest in the world. A thrust-bearing, designed to sustain a weight of 1,000,000 pounds, holds the entire weight of the revolving parts of each generator and turbine. The heaviest part of a generator weighs 300 tons, and its removal requires the joint use of two 150-ton cranes which have been installed in the power house. There are many more details of the power development—mere details in such a program, though gigantic in proportions—but enough have been given to show the magnitude of the program designed to produce almost 1,000,000 horse power from Niagara Falls, and further extend the vast program which designs the closest approach to electric saturation which the needs of the province may permit.

BRIEFLY TOLD

Melted basalt rock is molded to serve many industrial purposes, such as the manufacture of tiles, insulators, building blocks and utensils.

A new machine gun capable of firing 3,500 shots a minute is the invention of a Spaniard. The gun is composed of 50 barrels, each barrel capable of firing 70 shots a minute. Five men are necessary when the gun is in operation.

An airplane equipped with runners in place of wheels for the "take off," has completed a successful trip from Cochrane, Ontario, to Moose Factory, on the south shore of Hudson Bay, and return. On the return trip three landings were made in different forms of snow, but the ship took off with the ease of a flying boat on open water.

The "third degree" for obtaining confessions has been discontinued in Pittsburgh by order of the superintendent of police of that city.

Cheating contractors and crooked officials of Sumerian civilization in Mesopotamia 5,000 years ago were tried briefly and thrown into the river, according to recent scientific discoveries. Among other things, they had an elaborate banking system, with a reserve bank comparable to our own of today, a postal system with a parcel post branch and circulating libraries, which distributed clay tablet books.

Each acre of walnut trees in bearing will produce every year food approximating 2,500 pounds of beef.

In a recent proclamation Governor McRae, of Arkansas, declared his belief that the general use of tobacco by men and women, from youth up, generation after generation, is contributing to unmistakable and certain degeneracy. He set March 22 as "no-tobacco day," in Arkansas.

Germany's first skyscraper will soon be constructed in the old business section of Hamburg. It will be 16 stories high, topping the highest buildings in Germany at this time by five stories.

A combination church and hotel is to be built in New York City, according to reports. The building will be 17 stories high and will have Sunday school space in the basement, a church on the first three floors and a missionary school on the roof. A strict censorship is to be exercised over hotel guests, and dancing and card playing will be prohibited.

A toy balloon, released in Waukegan, Illinois, was found 11 days later in Altoona, Pennsylvania, as it descended into the street. The distance between the two cities is about 650 miles.

"Jewish Influence on American Life," Volume III in the series on "The International Jew," comprises a third selection of articles on the Jewish Question, and is now off the press. It contains 256 pages, and will be sent for the cost of printing and mailing, which is 25 cents.

"The International Jew," Volume I, and "Jewish Activities in the United States," Volume II, 235 and 256 pages, sent for 25 cents each.

Footsteps of a house fly booming out like thunder as it walked across a piece of paper have been heard by scientists visiting the Bell telephone system's research laboratories.

Declaring that young men of today know more about race horses than the Ten Commandments, while the Twelve Apostles are running a losing race with the actors and actresses in popularity with the young generation, Judge James Whitten, of the Department of Agriculture, deplores what he terms "a departure from religious teachings on the part of the younger generation."

St. Martin's-in-the-Fields, one of London's most famous churches in Trafalgar Square, turns its pews into couches for London's homeless each night.

Bangkok, the capital of Siam, contains 70,000 houses, a large portion of which float on bamboo rafts as a precaution against inundations, which are of frequent occurrence owing to the low surface of the region.

A break in the circuit of the wires of a new burglar alarm, caused by any moving of a window or door, pulls a telephone receiver down and sends a voice over the telephone wires to the exchange switchboard, giving the street and number of the house and announcing that it is being entered by burglars. Central switches the call to police headquarters and a patrol wagon is soon on the scene of activity.

Wild horses, in bands of 200 or more, may be found in Southern Idaho, especially along the Snake River in the more arid and isolated sections. These animals are as wild as deer and have no owners. It is said they have a habit of enticing domesticated horses from ranches.

Hollywood, Illinois, a little suburb of Chicago, has become so upset over the scandals reported in Hollywood, California, that a group of citizens has started a movement to change the name of the place.

Blind residents of Denver will be assured of safe passage across busy streets by means of blasts on police whistles which will be furnished to them free by the city. Traffic officers will see that all traffic is suspended when a blind person blows his whistle, until the blind pedestrian is safely across.

A burglar, claiming to be a graduate from a California school for burglars, and holding a diploma, was captured at Providence, Rhode Island.

An invention in the form of a new roller bearing for freight cars and passenger coaches cuts down friction some 90 per cent and abolishes the hot box entirely. The gross weight of a car and its load amounted to 122,600 pounds. This car was pushed 60 feet in one direction and then pushed back again to the starting point by one man in a recent test. After 11 months' service the bearings were found to be in as good condition as when they were installed.

Seven million square yards of canvas duck, received by the Bureau of Public Roads, United States Department of Agriculture, as surplus war material, is to be distributed to state highway departments for use in road construction.

A London news vendor claims the world's record for selling a single newspaper, with a total of 113,000,000 copies of the *Evening Star*. He has been selling papers since January, 1888, when the *Star* was first published. On August 4, 1914, he sold 29,000 copies to crowds clamoring for war news.

Motion pictures, which tell visually the story of athletics, classrooms, dormitories, fraternities and campus of Wittenburg College, Springfield, Ohio, are to be shown to prospective students at the college.

Chess by wireless is a popular diversion in the Yukon. Telegraph operators on the 2,000 miles of government telegraph line through the Yukon play chess by wire. Two men tap out their moves to each other and others listen in on the line and make the moves on boards of their own to show the progress of the game.

Specially constructed baths are now available for the dog aristocracy of Paris, with carefully trained attendants, masseurs and manicures to give each dog the benefit of their art.

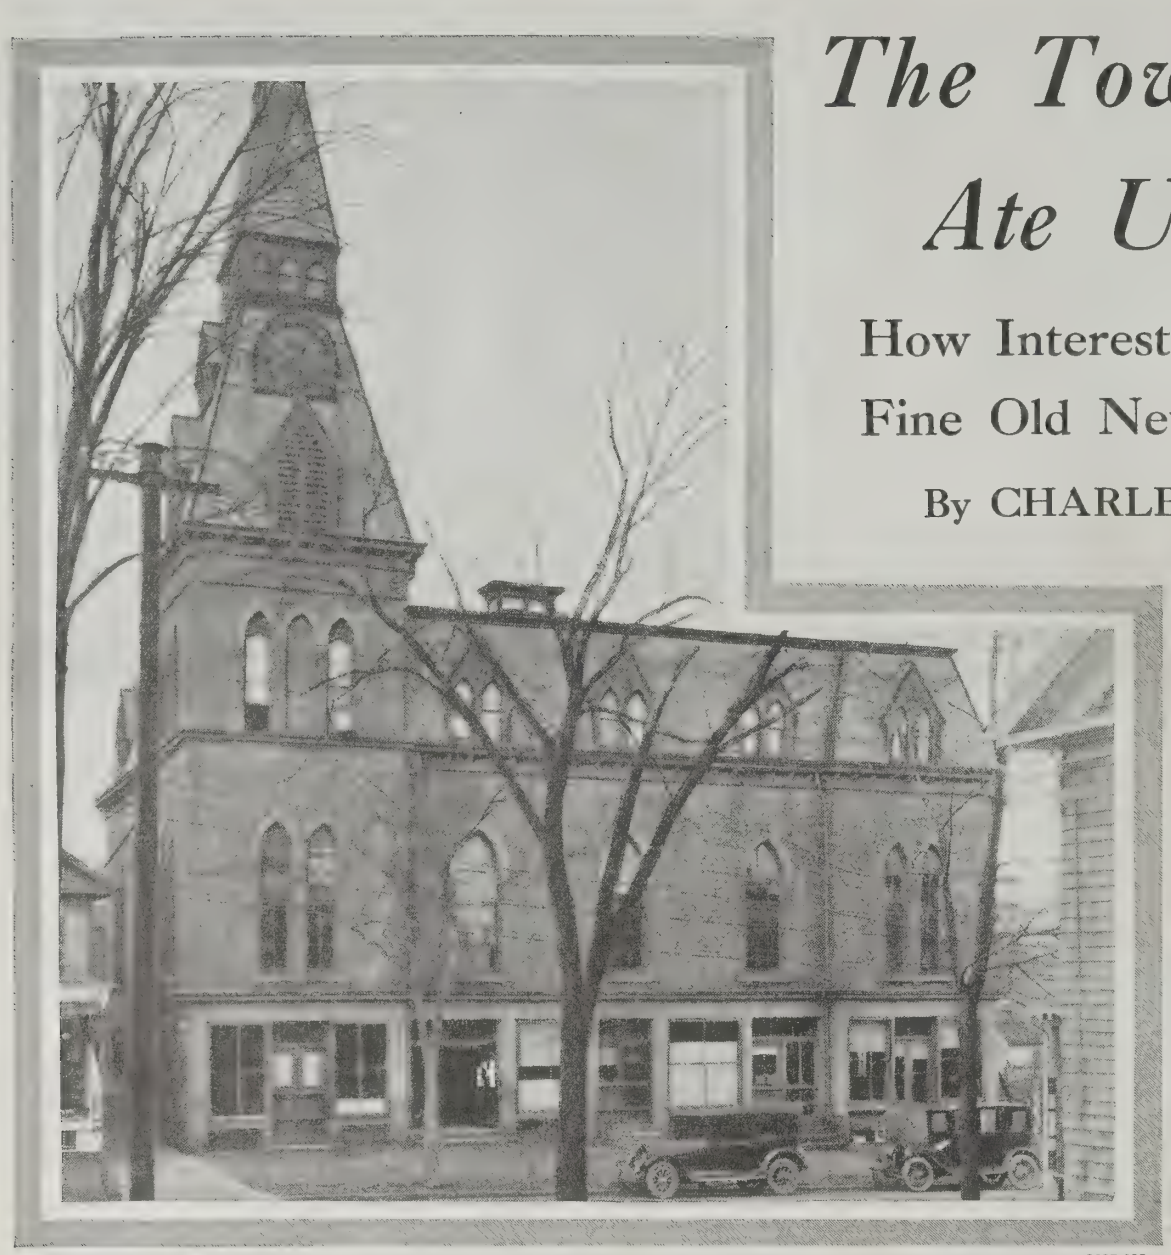
Paying for "Dead Horses"!
Is Your Town Doing That?

The Town Hall That "Ate Up" the Town



Shows What Debt Will Do and What Bond Issues Mean

Chronicler of the Neglected Truth

The Town Hall That Ate Up the Town

How Interest Charges Impoverished Fine Old New England Community

By CHARLES ALBERT COLLMAN

The Wallingford, Connecticut, Town Hall was built in 1869 on borrowed money; its cost, with interest compounded to date, amounts to $295,298.

HOW is your town financially? The chances are that you don't know.

How much of your taxes goes for interest on debts contracted twenty or thirty or fifty years ago? Somebody in your town knows.

Back in 1891 the town or city council said, "Let us sell bonds—thirty-year bonds at four per cent. Posterity ought to help pay for this!"

Well, here is posterity—now. We are posterity. The interest alone since 1891 has amounted to one and one-fifth times the original expenditure. That is, the "improvement" (which probably you cannot now find except as a record on the books) cost two and a half times what it was said to cost—and maybe more, if the debt has been "funded."

Posterity is carrying a load that it cannot carry much farther. Posterity was a good old horse, but he's breaking down.

The story which follows is the story of an American town located in a part of the country where all the financial brains are supposed to be. Read what happened to that town.

Look up your own town's affairs. Find how much of every dollar in taxes is paying for "dead horses." Find out what constitutes the millstone about your community's neck. Find out through what leaks the wealth of your town and its surrounding country trickles into little banks, and from little banks into big banks, and then into big speculative pools—the vast pools of money—which are provided by the interest and the savings of small communities, and used in the wildcat financiering of New York.

When the small towns of America begin to shut down, New York is going to run dry.

When the small town wakes up, the usurious interest burden is going to be lifted. The whole deceitful gold fallacy is going to be exploded.

And the manipulators of the people's money are going to work.

IT WAS a raw and blustery day. As we stepped out upon the sidewalk, we could hear the wind soughing through the branches of the great double row of elms and maples that lined Main street. The Selectman, having the subject on his mind, stopped for a moment to look back at the old Town Hall.

The Town Hall was a very old building, and a stranger might have been pardoned for remarking that it showed its age. Its style was that of bygone days. In fact, it stood back from the corner, apart from the busier thoroughfares, as if it were half in hiding, and ashamed of the part it had played. It was a three-story structure of red brick, with a mansard, and a tower with a black-faced clock that overlooked the town. In its doorway, the town signpost was plastered with probate court notices. In the basement was a barber's shop. From an upper window of the tower protruded a transparency of the Owenoco Tribe, No. 44, I. O. R. M.

The building housed the offices of the selectmen, the town clerk, the judge of probate and the court of burgesses. For purposes of thrift, the upper floor of the tower had been let to the Cheyenne Council, D. of P.; the Red Men's Club and the Owenoco Tribe. The auditorium on the second floor was used for social gatherings. The wings on the stage were in a state of bad dilapidation. So in a way were the adjoining rooms, the offices of the town officials, and the much-used stairway. Floors, ceilings and walls plainly showed the wear and tear of two generations.

In fact, the question of repairs had been the subject of conversation.

"I know it ain't a credit to the town," observed the Selectman.

"Then why don't we put up a new building?"

He shook his head.

"Well, I don't know why they named the Get-rich-quick man after this place, but our town's too poor to afford a new Town Hall."

The speaker's eye roamed across to Main street for a moment. Rather inadvertently he said:

"Our bank over there's just got out plans for a fine new building. Well, I reckon the town of Wallingford's paid for it."

This remark was an epitome of the town's history.

Wallingford, Connecticut, is about as American a community as one may find. It was settled by Puritans in 1670, and many of their lineal descendants live there today. Its stately elms and maples shade some of the few remaining streets in New England which represent the Colonial grandeur of the residential avenues of its forefathers. From the windows of nearly every house one can gain attractive views of the Blue and the Hanging Hills. The town played its part in the history of the Revolution and the Civil War.

Then when the period of reconstruction came, the future looked bright for Wallingford. One of its citizens had learned the secret process for the manufacture of German silver, the town was to become the father of the silver trade in the United States, and the future home for the manufacture of white metal and electroplated wares. It was known as the richest agricultural community in Connecticut, and during the fruit seasons, Wallingford peaches were the contested prizes in the markets of Boston and New York.

The process of development of New England towns was radically different from that of towns in the West and Middle West. Perhaps New England was foremost in the early stirring of civic consciousness, because its settlements were so much older. At any rate, this small Connecticut community took a great stride forward when it abandoned its old frame edifice and built itself a fine brick Town Hall, with a tower and clock.

Wallingford built it in 1869, at a cost of $45,000, borrowing $40,000 to pay for it.

Today, *a half century later, that debt remains practically unchanged.*

For purposes of illustration, the human imagination, as a rule, refuses to go back more than 50 years. In 1872, Wallingford had a population of 3,500. Today its residents number between 12,500 and 13,000.

This is not a story intended to deal with predatory finance or political mismanagement. Undoubtedly, the municipality of Wallingford has always been honestly managed, and as concerns its two banking institutions, they are owned and conducted by its own townsmen. But had Wallingford, in its early days, established a sinking fund and paid off its $40,000 debt, it would have tremendously altered its coming history. All would have been well had it adopted the business man's policy of paying its way. Instead of that, it decided to live on borrowed money. In this it merely followed a fallacious principle, born of custom and tradition. But, as will be shown, in adhering to this principle, the town retarded its growth, crippled its future, and placed a burden upon its townsfolk which has handicapped them for half a century.

On September 30, 1872, the report of the selectmen and the treasurer of the town of Wallingford showed its financial condition to be as follows:

Town bonds outstanding	$40,000	
Notes outstanding	30,718	
Interest paid on town bonds and loans		$ 3,461
Total indebtedness	75,894	
Total assets	16,980	
Balance against the town	$58,914	

Year after year, Wallingford consistently pursued the same principle. Whenever it paid a debt, it contracted a larger one. Instead of slightly increasing its assessments, it merely borrowed more notes. The balance against the town in 1875 was $45,794; in 1876, the adverse balance was $43,783; in 1877, $44,554.

The situation regarding the adverse balance became so embarrassing in 1880, that the selectmen took counsel. The First Selectman was a man of imagination. He conceived a stroke of financial genius that was worthy of Wall Street. In fact, it was an adaptation of Wall Street's financial methods.

"Look here," reasoned the First Selectman. "Didn't we borrow $40,000 to build the Town Hall? Well, then, why not put down the Town Hall as an asset?"

The suggestion met with instant approval. The report of the selectmen on September 30, 1880, was made out as follows:

Town bonds outstanding	$39,800		
Notes outstanding	22,972		
Interest paid on town bonds and loans			$ 3,850
Total indebtedness		$63,971	
Assets:			
Town Hall, including lot and furniture	36,000		
Total assets		53,051	
Balance against the town		$10,920	

So, at one stroke, an actual balance against the town of $46,920 was reduced, on a paper showing, to $10 920, and the selectmen felt proud of their achievement. From that day until the present time, the Town Hall has been carried as an asset.

Unfortunately, the better appearance of the annual report failed to reduce the growing debt of Walling-

North Main Street, Wallingford.

ford. In spite of the increased paper assets, the selectmen had to keep on borrowing money, as the following figures indicate:

Sums borrowed on notes:

1879	$21,171	1881	23,557
1880	22,972	1882	27,606
1883	26,140		

Again something had to be done. The banks began to object to loaning larger sums on short-term notes. Besides, most of the old town bonds were falling due. But at every Town Hall meeting, the taxpayers vigorously protested against having the valuations on their properties raised. The selectmen, in 1883, faced with the necessity of meeting a debt of $61,000, tried to raise themselves by their bootstraps. They decided to pay the maturing bonds with another issue, and to fund the short-term debt into an additional issue of fixed interest-bearing bonds. They made another loan

Simpson Library in Wallingford.

of town bonds in the amount of $35,000, and a second loan of $25,000.

Wallingford now had a bonded debt of $64,000, although its real assets had in nowise been increased.

From 1872 to 1883, inclusive, Wallingford had paid out $38,283 in interest on its loans, which was almost enough to have paid off the original loan made for building the Town Hall.

Wallingford had not paid off one dollar of its old debts, and it still kept on borrowing. In 1894, it raised $25,000 on notes; in 1895, $32,000; in 1896, $33,360. And the balance against the town had jumped to more than $40,000.

Another financial crisis was inevitable, and it came in 1897. In this year *a direct mortgage was put on the Town Hall,* the loan being for $30,000 at four per cent. This brought up the bonded debt of the town to $92,000.

In the quarter of a century that had passed since 1872, Wallingford had not been able to afford a single new public edifice. It was still staggering under the accumulating burden of debt incurred in the building of its now antiquated Town Hall back in 1869. Its population had increased in that time from 3,500 to 8,000. It needed schools and public improvements. Smaller communities round about had long since outstripped it in wealth and progress.

The secret of Wallingford's backwardness and poverty lay in the fact that in *25 years it had paid out $98,684 in interest,* without having reduced its old debts. Still the old policy of borrowing money to pay its way was continued. The selectmen had awakened to the sense of its dangers, but they were helpless. The taxpayers fought, as they had fought since 1872, against an increase in the tax rate.

In 1900, the assets of the town were $46,770, against an indebtedness of $95,296, showing a balance against the town of $48,526. In 1903, the adverse balance was $49,150.

In their report for 1909, the selectmen reproached the taxpayers in the following words:

"As we told you in last year's report, the 10-mill tax would not meet the expenses for the year 1909, and the treasurer's report will show the amount paid out over the cash receipts for the year."

It was necessary once more to fund the town's floating debt into a fixed interest-bearing bond issue, to the amount of $45,000. And in 1912, another bond issue of $40,000 was put out, making the bonded indebtedness of the town $147,000.

The awakening came to Wallingford in 1914, with a widespread realization that something was radically wrong with the town management. The smoldering discontent broke out into open reproaches at the town meeting that year. One resident gained the floor and told the blunt truth. He was armed with figures. He pointed out that the town now had a population of approximately 11,000, and that the grand list (assessed valuation) approximated $8,000,000 to $9,000,000, and yet no large public improvements had been made possible because of the shape of the town's finances. The school system was deplorable and all public facilities were inadequate. The Town Hall, he said, was the town's Frankenstein creation. It had eaten up the resources of the community. And that was because no sinking fund had been adopted to pay off the old obligations. And he called attention to the fact that since the $30,000 mortgage had been placed on the Town Hall back in 1897, not one dollar of that debt had ever been paid off.

These criticisms, made in open meeting, shocked the townsfolk. The truth was unpleasant to hear. Timid and conservative residents protested that if such talk were to gain headway, the credit of Wallingford would be destroyed. The story would get into the newspapers, and the town wouldn't be able to borrow another dollar in the state of Connecticut.

Care was taken that nothing said at this meeting got into the papers. But the words had had their effect.

The report of the selectmen for 1915 contained a frank warning and announced constructive action. They said:

"The treasurer's report will show the town's indebtedness; it will also show that we have $60,000 outstanding temporary loans in notes, which is $10,000 more than last year. Two bonds have been paid off that came due last year. *One thousand dollars was paid on the old Town Hall bond series of 1897, the first payment ever made on the Town Hall.*"

In fact, the situation of the town's finances in 1915, showed Wallingford to be in a parlous state. The indebtedness of the town was $203,000, while the assets figured up to only $120,453, leaving a balance of debt indicated as $82,547. The interest paid that year aggregated $8,064. And there were $60,000 in notes outstanding.

During all these years, the loans made by the town had been contracted with the First National Bank and the Dime Savings Bank, both of Wallingford, and, quite naturally, these two institutions had prospered exceedingly. Sinking funds were now established in the Dime Savings Bank for the gradual liquidation of two of the old bond issues.

But it was not easy to stop the debt accumulations that had been rolling up so lustily for the last 44 years. In 1916, the selectmen complained that they now had outstanding a temporary loan in notes of $70,000, which was $10,000 more than the year previous, and that it had been found necessary to borrow more money to meet the current expenditures.

But the town had awakened to its needs. It boldly contracted a loan of $250,000, bought land and laid plans for the construction of a large new high school, the need for which had been bitterly felt for a long while. Two years later, $80,000 additional was borrowed for school purposes.

In 1919, Wallingford paid out in interest and coupons, the sum of $20,123. Its indebtedness was $470,930, against assets of $383,745. But the townsfolk now began a heroic struggle to wipe out the annual adverse balance. A general revaluation of properties had been set in force.

In 1920, for the first time in 49 years, the town showed a balance over its indebtedness. In 1921 this favorable showing was continued, although the town still has outstanding in notes a sum of $50,000, which it will be compelled to fund by a bond issue in the current year.

Wallingford is being rejuvenated. It is paying off its debts. The selectmen, in their report for 1921, describe how this result is being accomplished. They say:

"The original issue of bond series 1899, was $60,000, of which $44,000 has been paid, $2,000 being paid each year.

"A sinking fund is being created by depositing in the Dime Savings Bank $1,000 each year, to retire bond issue of 1912, at the rate of five bonds every five years, as per town vote.

"A sinking fund is being created by depositing in the Dime Savings Bank $1,000 each year to retire bond issue of 1897, as per town vote.

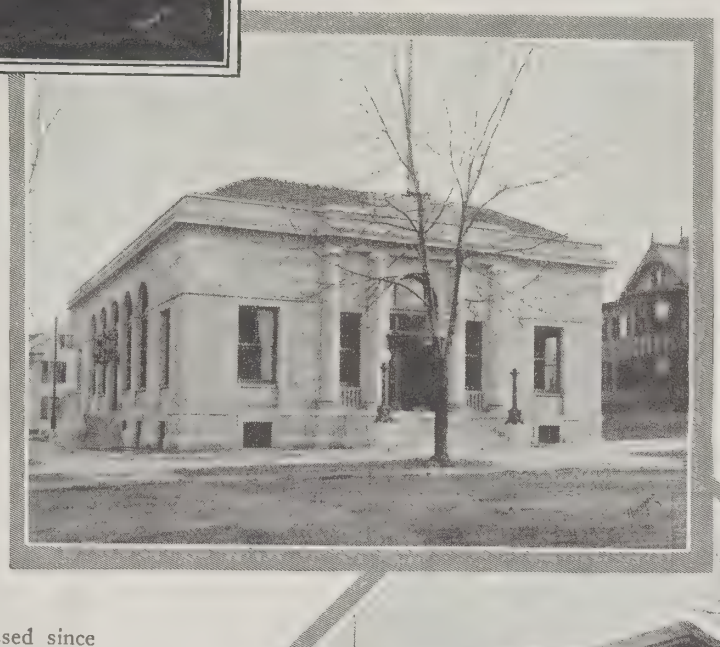
"Original issue of bonds, series 1916, was $250,000, of which $40,000 has been paid, $10,000 being paid each year, as per town vote."

It is a slow process to get rid of old debts. Wallingford, emerging from its years of bondage, and beginning to breathe freely for the first time, is, nevertheless, somewhat staggered as it looks back and reviews the cost of its borrowings for the half century.

Wallingford today boasts of some fine public structures, but, with one exception, none of them was built by the town. It has a handsome library, but this was the private donation of a public-spirited citizen, who endowed it at a cost of $45,000. It has a new armory, but this was put up by the state at a cost of about $100,000. It has a post office, but this was built by the Federal Government, with an expenditure of $95,000.

Wallingford had placed a $30,000 mortgage on its old Town Hall in 1897, and the entire issue of bonds is still outstanding today. *The principal, with interest compounded since 1897, foots up to a bill of $79,975. In other words, in a quarter of a century, this antiquated and obsolete structure, now falling into decay, has cost Wallingford nearly twice its original expenditure.*

Wallingford originally borrowed $40,000 for building its Town Hall back in 1872. *The original debt, with interest compounded for half a century, amounts to the sum of $295,198.*



That is, the debt on the town hall, compounded, would have paid for erecting the post office and the large new high school. In the 50 years, all told, from 1872 to 1922, Wallingford's inhabitants slowly grew in number from 3,500 to 13,000. *During that period, this small population paid out in interest on its borrowings for town purposes, the sum of $321,916. This enormous interest burden, not only a dead waste but a handicap, could have paid for the expense of building the state armory, the Federal post office and the Simpson Library, with a good balance left over.*

Had the citizens of Wallingford annually deposited the interest paid on town loans since 1872, in one of the banks in their town, that institution would have paid them compound interest on their deposits. *And the interest paid out on the town loans for half a century, if thus deposited, would have mounted up to the enormous sum today of $728,868.*

This example also may be demonstrated as follows:

Cost of the central school district, land, buildings and contents, $336,000; cost of the new high school, $200,000; cost of the new armory, $100,000; cost of the new post office, $95,000; total cost of all the town's new improvements, $731,000.

Interest paid on town loans for half a century, compounded, $728,868; balance, $2,132.

Above, at left — The post office. At left — Wallingford's new high school.

The new armory.

All of which goes to show that the interest paid on Wallingford's debts, which was money thrown away, would have been sufficient within some $2,000 to have paid for nearly all the fine modern public buildings which now grace the town, including all of its schoolhouses, lands and buildings.

All debts grow from small beginnings. In its early years, had Wallingford chosen to pay its way without borrowing—which it might easily have done by slightly increasing its tax rate and establishing a sinking fund—its future destiny would have been altered.

Wallingford's experience is an eloquent example for other communities *not* to follow. Its lesson is easily perceived, especially when contrasted with the fallacious theories of financiers, who have loaded heavy interest burdens upon the American public. Those theories were never born on American soil, and the future may yet demonstrate that there is no need of a parasitic class to prey upon the public and devour the fruits of its efforts.

The Tyranny of the Majority

ALEXIS DE TOCQUEVILLE, the French economist, who in the first half of the nineteenth century was commissioned to survey democracy as it exists in the United States, in his comments, says:

> "The greatest danger to liberty in America is in the omnipotence of the majority. A democratic power is never likely to perish for lack of strength or of resources, but it may very well fall because of the misdirection of its strength and the abuse of its resources. If ever liberty is lost in America, it will be due to the oppression of the minorities which may drive them to an appeal to arms. The anarchy which must then result will be due only to despotism."

Written nearly a century ago, no thinking man of today can consider this sentiment as less than a prophecy. It is true the United States has survived several periods when the tyranny of the majority has seemed almost intolerable, but never before has there been such a dearth of defenders of individual rights. The right of personal opinion and its expression is challenged by the majority. Proscription is rampant. In moral questions despotism on the part of officers of the law is applauded. The courts are filled with satraps of the intolerant majority.

There is need for an awakening to the fact that our liberties are in danger. The growth of radicalism has its origin in the oppression and suppression from a government sustained by a bigoted majority blind to their own interests.

Since the days of Adam, the question of how far one man is his brother's keeper has been one of controversy. Late years have been characterized by more and more taking over by organized society of the regulation of the individual's conduct. Public officers, quick to sense the fact that the majority stands for a close control of individual actions, have gone sled-length in paternalism. Bureaucracies, far beyond the wildest dreams of a few years ago, have grown up. The idea of freedom itself has changed from a belief that the individual is entitled to work out his own destiny with the least necessary government, to a belief that the ramifications of government must be infinite that the individual may have a proper "freedom." The first belief grew out of a confidence in democracy; the second, whether its supporters will confess it or not, comes from a vast distrust in democracy.

The Basis of Credit

NATIONAL credit is founded on the resources of a country, its productivity, its man-power, its undeveloped possibilities. Individual credit is computed on one's material possessions. National credit is utilized in the borrowing of money. Why, then, since that credit also gives stability to the money the nation borrows, is it necessary to assume a burden of interest greater than the loan itself?

The aggregate public bonded indebtedness of the world is declared by statisticians to be one hundred times greater than the total world's supply of gold, nominally the backing of the world's money. The volume of money in circulation is also 20 times the gold value. To this must be added the volume of checks, drafts, bills of exchange, and other evidences of private credit that perform all the functions of money, the whole forming an inverted pyramid.

The sole function of money is that of a medium of exchange. Originally in this country it was not deemed necessary for the government to issue money. It was thought sufficient to afford individual owners facilities for the conversion of bullion into coin. Government was content to "fix the value thereof, and of foreign coin." Prior to the Civil War, except during the existence of the United States Bank destroyed by President Jackson, the issue of currency was authorized by the several states under regulations intended to guard the public. This was not an ideal plan, for it involved keeping watch of the individual standing of the banks of issue. The founding of the national banking system, with a restrictive tax on circulation, was an attempt to nationalize the creation of a circulating medium of exchange that so far has failed of its mission for two reasons, namely: Failure to utilize the full power of the government to issue all money, and dependence on a metallic money basis. The power of issue has been delegated to the holders of the money base, giving them absolute power to control the money volume and its value as a medium of exchange.

Until one discards the notion that there is need for other value in money than that given by government, until it becomes apparent that a dollar is not merely the representative of so much gold, but a means of appraising the relative values of all commodities, there is little hope of progress in the study of the money question. The dollar is such because the law says it is a dollar. The law says an ounce of gold is worth a fraction over twenty dollars. It also fixes a price for silver produced in this country nearly twice that the market establishes for foreign silver, and coins it into money worth 20 per cent more than the native bullion. Gold and silver are "standard" money, all other issues being termed "lawful" money. Of the various issues in circulation none is redeemable except under conditions making it impossible for the holders of small amounts to carry out. Yet the government fiat is sufficient to maintain the conglomeration at a parity.

If this is the fact, and it is not disputed by the proponents of the present money system, why will not the government credit sustain a system of its own, and save the enormous waste in production entailed in the payment of interest?

An American Speaks

AS REFRESHING as it is surprising is the clear-cut recommendation of Lillian Russell on her return from Europe where she gave some time to the study of American immigration perils at their source. Miss Russell urges the complete suspension of immigration for five years.

Miss Russell's recommendation comes with added force because she began her inquiry much impressed with the sympathetic aspects of immigration. Her first interview on the subject laid great stress on the hardships which aliens at Ellis Island were forced to undergo when their path to admission to this country was beset with obstacles.

Miss Russell's survey of the swarm of undesirables of which Europe is trying to get rid at America's expense aroused her keenest alarm. She was confronted everywhere with evidences of the vast extent of the organizations which are devoted to flooding the United States with propaganda regarding "suffering" and "humanity," designed to further the plan to unload undesirables upon this country.

STATEMENT OF THE OWNERSHIP, MANAGEMENT, CIRCULATION, ETC., REQUIRED BY THE ACT OF CONGRESS OF AUGUST 24, 1912,

Of THE DEARBORN INDEPENDENT, The Ford International Weekly, published weekly at Dearborn, Michigan, for April 1, 1922, State of Michigan, County of Wayne, ss.

Before me, a Notary Public, in and for the State and County aforesaid, personally appeared Fred L. Black, who, having been duly sworn according to law, deposes and says that he is the Business Manager of THE DEARBORN INDEPENDENT, and that the following is, to the best of his knowledge and belief, a true statement of the ownership, management, etc., of the aforesaid publication for the date shown in the above caption, required by the Act of August 24, 1912, embodied in Section 443, Postal Laws and Regulations, to wit:

1. That the names and addresses of the publisher, editor, managing editor and business managers are:

Publisher, The Dearborn Publishing Company, Dearborn, Michigan; Editor, W. J. Cameron, Dearborn, Michigan; Managing Editor, W. J. Cameron, Dearborn, Michigan; Business Manager, Fred L. Black, Dearborn, Michigan.

2. That the owners holding one per cent or more of the stock are:

The Ford Motor Company of Delaware, Henry Ford, Dearborn, Michigan; C. J. Ford, Dearborn, Michigan; E. B. Ford, Detroit, Michigan.

3. That the known bondholders, mortgagees, and other security holders owning or holding 1 per cent or more of total amount of bonds, mortgages, or other securities are: None.

4. That the two paragraphs next above, giving the names of the owners, stockholders, and security holders, if any, contain not only the list of stockholders and security holders as they appear upon the books of the company but also, in cases where the stockholder or security holder appears upon the books of the company as trustee or in any other fiduciary relation, the name of the person or corporation for whom such trustee is acting, is given; also that the said two paragraphs contain statements embracing affiant's full knowledge and belief as to the circumstances and conditions under which stockholders and security holders who do not appear upon the books of the company as trustees, hold stock and securities in a capacity other than that of a bona fide owner; and this affiant has no reason to believe that any other person, association, or corporation has any interest direct or indirect in the said stock, bonds, or other securities than as so stated by him.

FRED L. BLACK,
Business Manager.

Sworn to and subscribed before me this 23rd day of March, 1922.

[SEAL] J. EMMET HALL,
(My Commission expires September 29, 1924.)

The "Evolutionists" Again

MR. BRYAN once annoyed them because he was too forward, now he makes them writhe because, they say, he is too backward. He is against the teaching of "evolution" in the schools; by "evolution" he means, of course, the doctrine that mankind represents an ascent from the brute order; that is practically what everybody means by "evolution."

Of course, no one who has kept step with science teaches that with confidence any more. No good scientist could teach it, because no one knows that it is true. No one ever did know it to be true. The idea of development was a great idea, a very great idea, but, as applied to the development of man's body and mind from a lower bestial body and mind, it has never been even a full-fledged hypothesis. Its status has been that of a very exciting piece of imagination. And presently it became a matter of temper: if you were against the more sober forces of life, you were for "evolution": if you were a conservative, you were against it. Of late, however, when you touch "evolution," you jar the most conservative and reactionary circles. This temper had nothing whatever to do with science, and it has precious little even yet. It is very significant that the most virulent of Mr. Bryan's antagonists are represented by the so-called "liberal" sectarian press and pulpit, who have not yet heard from the really progressive scientists that Darwinism is dead. A few scholars—or, rather, professors—have contended right rhetorically for the liberty to teach the "assured results of science" in the classes, but they need to be told, as kindly as possible, to get revised editions of the textbooks from which they prepare lectures.

There would be no controversy today between Mr. Bryan and his critics if the destructive aspects of scientists' (not scientific) speculation were not so alluring to a certain sensation-loving section of the country.

Science is the most conservative department of life. It proceeds upon imagination and research, but it only declares upon facts. The popular mind always catches the imaginative aspect of the scientist's daily work, and as a rule totally ignores his solid findings. There are people who still talk hazily of the "millions of years" in which man has been on the earth, though it is improbable that the most behindhand science-jobber would say anything of the kind. The psychozoic era, that is, the age of man or age of reason, the time during which civilized man appeared, is estimated as being less than 30,000 years. Which is very different from "millions and millions" of years.

It is quite noticeable that in the controversy which Mr. Bryan has caused, scientists are silent. They cannot talk half so confidently as can the Commoner and the "evolutionists."

Wall Street's Alarm

WALL STREET has been successful for years in averting serious governmental attempts to regulate its operations. Now, threatened with ruin from within, because of the buying public's distrust and consequent refusal to invest, larger Wall Street houses are themselves advocating uniform state blue sky acts and a denatured Federal regulation.

Prospective Federal legislation relative to stock-broking concerns Wall Street, the spokesmen of which seem much exercised over the danger of laws being framed by persons unfamiliar with the stock exchange. The Federal Government can well consider the dangers from laws framed by persons familiar with the stock exchange. Persons familiar are too apt to be interested in playing the markets themselves.

A Wall Street suggestion is that the American Bankers' Association be permitted to frame the Federal regulatory laws. To the great mass of citizens it would seem that the banking phase of stockbroking is really one of the gravest subjects to be dealt with in any legislation. The manipulation of stock prices through the call money market and the practice of banks accepting, as collateral for loans, speculative stocks, are matters that call for legislative consideration.

There have been several other suggestions for legislation emanating from Wall Street sources which call for rigid scrutiny. A proposal to limit the number of brokerages is made. This idea would draw the warm approval of such well-established brokerages as would be certain to gain the political ear of probable licensing powers. But the dangers from close association between stockbrokers and governmental officials cannot well be overlooked.

Most Wall Street suggestions have their basis in the desire for friendly co-operation of the government in preventing practices which injure the traders in stocks.

It would seem better for the government to act to protect producers and consumers whose welfare is being gambled with than these traders who reap over and over again the harvest of "the nimble eighths," through which brokerage commissions eat up the vast hiatus between producing and selling prices.

Mr. Ford's Page

A MAN is never so certain to be right as when he stands on principles, and he never has so many chances of going wrong as when he goes in for personalities. The descent to details, except in the thing next to be done, is always fraught with danger. The thing proposed to be done is either good or not good for the immediate need; or the man proposed is either good or not good for the immediate place or task. When we go farther than that we are in danger of entering the realm of untruth.

It is very significant that most of the impeding disagreements among the people have nothing to do with the thing immediately at hand, but with future extensions of a theory or a program which no one knows will be the best theory or program when future tasks are reached.

To take an illustration: There were probably never so many minds exercised about our money system as there are today. Judging from the mail of one office, there are tens of thousands of people in this country who have discovered that a system which once served as an aid has now become an obstacle. In the most unexpected places there is exhibited an amount of zeal and labor on this problem which cannot but mean great good to the country at large.

One characteristic, however, is quite prominent in all this work: the minds thus exercised have run ahead of the actualities and have spun out of logic and imagination scores and hundreds of complete theories and systems which look forward to a thousand years of practice. With few exceptions, each laborer in this field has spun his own system which he is ready to put into operation tomorrow morning, if given the opportunity.

Now, when most of these proposed systems leave the facts of today, and soar into the long future, they take different tracks. They begin their work almost at the same point, but they diverge as they extend it. Then they fall to arguing with each other, and sometimes to denouncing each other, because the far future phases of their schemes do not agree. Not one of them knows what the future condition is to be, not one of them knows whether his system will meet the needs of the changed future, they only think so; that is, they only imagine so, and because their imaginations differ, they are separated into opposing camps and the public comes to regard them as cranks who cannot understand each other.

Our duty is not to prophesy but to do the next thing which stands waiting to be done. If this were our rule, action would take the place of theorizing. Action is the judgment bar of all theory, anyway. Suppose there are one thousand steps to be taken before we reach the condition desired; does any one assume that he is able to say what Step No. 897 will be? But we may know what Step No. 1, or even Numbers 2 and 3 should be.

Society has no wings by which to fly at one flight from the present deepening tangle of things to the desired improvement which we are sure is coming. Society can only cut steps in the stony mountain side and mount by sheer effort. To see where the next step of the ascent can be cut, and rigidly to bend ourselves to hew it out that men may mount by one step more, is the duty laid upon The Men Who See. And, having cut that step, the place for the next step will be apparent. We cannot look up the mountain and say where the one hundredth step must be placed. We shall know that, when we have made the 99 steps that lie between.

The first thing to do is to take stock of what is wrong and then look round and see how it can be righted for the best interests of all the people, particularly of those who make up the mass of society and whose interests are most easily juggled with.

That, perhaps, expresses the problem in human terms. To be human does not mean to be sentimental and impractical. Life is no joke even at the best and men should not expect to be wrapped in cotton wool—indeed, it is an injustice to the great majority of our people even to think that they expect to be tenderly carried around. What is meant by the term "human," as here applied, is this: No system can endure that does not give the plainest man and his family as much of the protective power of justice as it gives the great industrial and commercial institutions.

It is all right to protect industry; it is all right to protect financial institutions; but to protect these from the natural and periodical consequences of a false system, while at the same time letting the populace bear the full brunt of the fallacy, is emphatically not right, and nothing can ever make it right. Of course, the only way this protection could be extended would be by inaugurating a system which would make such protection unnecessary. When the power of the government is lent as a crutch to help powerful institutions which have been crippled by our system, that in itself is a powerful object lesson, an irresistible plea for a profounder remedy.

We who have been able to live and succeed under the present system have the right to say, and it is our duty in behalf of other men to say, that a system which crushes the weak and compels them to pay for the mistakes of the strong is not a system which any red-blooded man would endorse if he could see it in a small working model. We need to see our system in a small working model, and then we shall agree that it needs some serious engineering thought expended upon it. It is not cruelty that perpetuates such a model; it is blindness.

Where shall we begin? At a point independent of the frailty or folly of man—we may begin with the earth. Some men have sought to found the new monetary system on roads, but roads are not specifically productive. It has lately been suggested that a non-interest-bearing currency be founded on water power: water power is productive; it can pay itself back in the old interest-bearing currency if need be.

But the need is a money that will flow, a money that will release the pent-up human energies and the natural forces which are waiting to remove our depression and fill the land with prosperity. All the requisites are here; the tie-up is in money. What is money that it should tie up energy? Yet it does. Not, however, because it is money, but because it is money which our government has put into private control, and is afraid to take out of private control.

Our government ought immediately to resume its constitutional functions with regard to money. The Constitution gives Congress the power to do this thing, and a large part of that power has been delegated to private banking corporations, and, of course, these corporations thrive on interest. They are the middlemen between the Government and the People, and they ought not to be. However useful banking is, it has no place between the People and the Government. We might as well put out our Navy on contract, and delegate to a corporation the work of providing a United States army, as give to private banking corporations their large power over our money.

Interest is already eating the kernel out of all our effort. The country is becoming hopelessly mortgaged before it begins. Common sense, business sense, political sense requires that we begin to make our money contribute to the wealth of the country, to the freedom of the country, instead of to its debt and bondage. We can do this by issuing currency on Natural Power, which is beyond the stupidity of man to destroy or mismanage. Our very Government and Nation are founded on the land and the people. Surely that is a good enough base for our national currency.

MONEY came into being as an aid to doing the next thing. The new kind of money—the money that releases energy—will come into being in the same way, out of an absolute necessity not to entail a burden of interest, privilege and graft upon the people who work. The next step only is the step to be taken; after that, the second step will disclose itself. It is quite useless to attempt to forecast the financial system of one hundred years hence; but we can start where we are and devise a sound currency, based on nature's active productive forces, that will start affairs and keep them going, without clogging and killing them again by the endless increment of artificial interest.

A typical London "Bobby".

Scotland Yard and the Finger Print

A Close-Up of London's Great Police System

By ROBERT J. THOMPSON

ABOUT 14 years ago, in the summer of 1908, to be exact, I met a doctor friend from New York in London. He was taking a special course of study in the Royal College of Surgeons. He had a peculiar drift toward the study of criminal psychology, and, as I discovered afterward, made the arrival of each acquaintance from home the excuse to visit, as a guide, the Museum of Crime at Scotland Yard.

Having established himself with one of the commissioners, the doctor would take his friends to the place, ostensibly to show them something unique in the great metropolis, but in reality to satisfy what seemed to me to be a morbid interest in the mentality of the underworld.

At that time active and experimental work by the police was being carried on throughout the world in the finger-print identification field, and as a special "compliment" to visitors to the Yard, the new system of criminal identification was explained and a print of the finger tips made and given as a souvenir to the caller; name and address, occupation and so forth being previously recorded.

I visited this museum in 1908 with my friend the doctor (it has been closed to the public in recent years) and after spending an hour or two examining the exhibits, went through the finger-print business, according to the practice, gave them an impression of my finger tips, took a copy of it and went away.

Now, there is a theory that the instinct of the confirmed criminal, as well as the potential criminal, attracts him to such display as would be found at the Scotland Yard Chamber and Museum of Crime. He may see there old friends in the varied paraphernalia of murder, revolt, burglary, confidence games, counterfeiting, porch-climbing, forgery, safe-blowing, with hold-up accessories and all that. I do not suppose that any old-timer who had the opportunity, nor any novice, for that matter, who was contemplating embarking in certain of the several businesses I have named, would have missed a chance to visit this show at most any cost.

However all that may be, the reason for this little preface will be apparent when I recite the following up-to-the-minute circumstance.

I called at the headquarters of Scotland Yard the other day and asked to see the chief of the criminal identification bureau. I was asked for my name, and an indication of the nature of my business. Taking out a little leather folder I carried, the souvenir copy of my finger prints of 1908, with all the identification memoranda (excepting the date) removed, I handed it, with nothing else, to the messenger, remarking: "Here's my card and I will tell the chief himself the nature of my business."

While attending the response to my card, I may divert for a moment for a few words of explanation. The system of finger-print identification is now a very practical affair and almost a matter of exact science. It is founded on the singular fact that the lines of the finger tips are never the same with different persons. From this discovery they have advanced through a formula of mathematics which leads the investigator directly to the solution of the problem on which he is engaged. The system is 20 times more effective or reliable than any other method of identification known. These lines are grouped into four principal classes, called arches, which are given an arbitrary value of five; of loops, which are put down at 60, and of whorls at 35, giving a total of 100 points. Then there are pockets, deltas, ridges, termini, and accidentals, with inner and outer loops, terminal ridges, lateral pockets, and so on.

These characteristic lines are given numerical valuation according to a fixed schedule and when totaled they lead, as I have indicated, by some uncanny anatomical factor to identification that is more certain than photography, or the so-called antheometric head measurements. The work is a simple and reliable process and when finger marks are shown on a poisoner's glass, on the blade of a knife, a door knob, or on the wall of a room where a crime has been committed, they are unfailing in their identification of the person who caused those prints, provided, of course, duplicate impressions can be procured.

The work will have attained its highest expression and achievement at Scotland Yard, and it will be of peculiar interest to Americans just now because of the proposal to use the system for identification and signature confirmation in the projected rejuvenation of the Postal Savings Bank. And not only this, but a German professor has only recently come forward with a statement, after exhaustive study and thousands of experiments, that the past and future, the destiny and life trend of man may be known by a scientific analysis of the lines of his finger tips. As far as I have been able to learn, the psychology of the science has heretofore been ignored and this phase of the profession has possibilities of a fascinating and useful character.

But let us return to my visit to Scotland Yard.

After waiting for about three quarters of an hour—a long time, I thought—the messenger returned and I was led to an office where a keen-eyed and pleasant-faced man sat at a big desk and greeted me with a wave of his hand. Looking up and, speaking slowly, he said: "Take a chair *Mr. Thompson,* and tell me what we can do for you. I see by your dossier that you are no longer in the American consular service. That you resigned in 1915. That you wrote a book on the war—in the early days of the conflict. That you passed through our 'Intelligence' lines from Tilbury Docks to Holland in May, 1915, with a special journalistic commission from the Chicago *Tribune* and the London *Times.* That you became ill at The Hague. That you spent the winter of 1915-16 in Berlin, and that you went to Switzerland to recuperate and stayed there until after the close of the war. Now, again, what can we do for you? It is further observed that you were introduced here in 1908 by a Dr. Clark, of New York."

"Well," I responded, "what can you do for me? You have already done it! Three-quarters of an hour ago, not a soul about the place knew my name nor who I was, nor where I came from. I must say that the thing works perfectly and it is too bad, I am sure, that I am not a criminal, and that I was not a German agent."

"Capital!" he said, "we knew you were not, and by two incidents which occurred in the winter of 1915 and 1916. Shall I tell you what they were?"

"Go ahead," I answered.

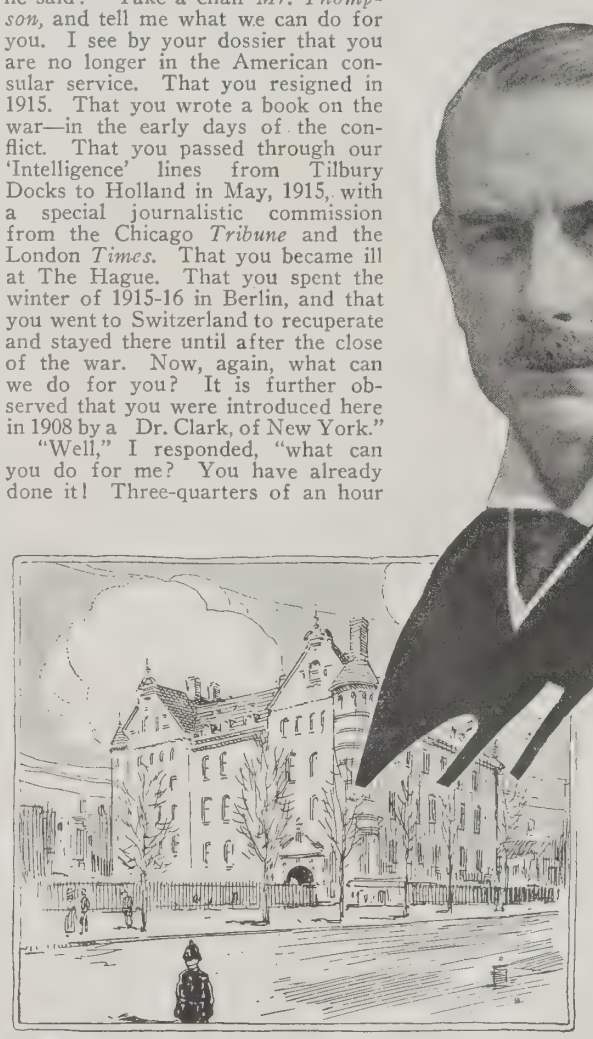
"Very well! Here you are," looking the meanwhile at some memoranda on his desk. "At a meeting of a committee of so-called Americans (the proceedings were carried on solely in German) at the German Authors' Club on November 15, 1915, in Berlin, you declined peremptorily to go on the platform and make an address with Sir Roger Casement. You further refused to make any public discourse whatever without first consulting your ambassador, Mr. Gerard, and submitting a copy of your speech to him for censorship. And in February, 1916, you repulsed, with proper spirit (for the proposal was made by one of our own men), a suggestion that you accept a large fee—a very large fee—to go to Washington on a secret mission for the German chancellor, Von Bethmann Hollweg. Your voluntary and spontaneous action at the German Authors' Club in the one instance, and your response to our test in connection with the Von Bethmann Hollweg offer, were sufficient for us, and, after that, we left you alone."

Here was I, a business man by occupation and a dilettante journalist when opportunity offered, drifting into Scotland Yard to get some color and statistics to divert myself by writing something on this greatest of police and detective institutions in the world—to talk to some one about Sherlock Holmes, Jack the Ripper, Raffles, the gentleman burglar, and so on, when I come up against the real thing by a stumbling instinctive interest in a simple attempt to test the finger-print identification work of Scotland Yard. Of course, the idea had been in the back of my head, and I had thought of it at different times in a vague sort of way ever since my first visit to Scotland Yard, that the experience I had had in 1908 with Dr. Clark, on the occasion referred to, had possibly become a real record of Scotland Yard.

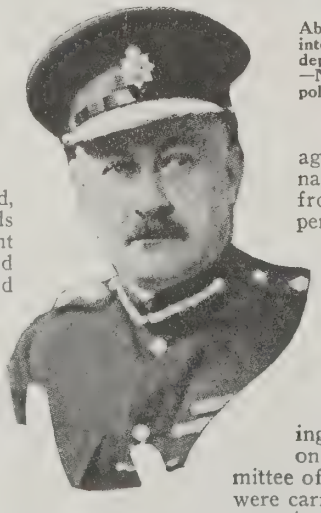
In the forthcoming book on the workings of Scotland Yard during the war, Sir Basil Thomson, late chief of the political intelligence department of Great Britain, declares that the intelligence service of England, when the war broke out, was thoroughly disorganized, juvenile, and altogether the poorest in Europe. On the other hand, however, Sir Basil claims that in eighteen months or two years, it was the best in the world, if not in all history. It was natural, too, that it should be, for by the time America was drawn into the conflict, all the allied and associated powers, with their embassies, legations and consulates, not to mention relief societies, clubs, and so forth, throughout the world, and particularly in Europe, were co-ordinated and exchanging information and reports, with the result that a record of every person, male or female, military, diplomatic, or plain ordinary loafer or business man, who moved from one country to another, or for personal reasons found it necessary or agreeable to stop in some country other than his own, was docketed, indexed, and cross-indexed in these centers and, finally, summed up and analyzed in London, Paris, Rome and Washington. But Scotland Yard, under the aegis of the British home office in London, was the soul and center of this world complex, and Basil Thomson the genius of that organization.

Aside from some great or exceptional eruptive period such as war, revolution or assassination, when a man like Thomson may stand out as an international character, it is difficult to connect any personality with Scotland Yard, which is an intensely characteristic and at the same time romantic institution. For the Londoner it has about as much interest as the Stock Yards have for the Chicagoan; on reflection, I should say less. But being the most important police and detective organization known, Scotland Yard has been a fruitful and never-failing source of romance and fiction for many years, and the more so since its actual workings are secret and executive. Scotland Yard is a system and its head is in the government cabinet. The minister of the home office is the real chief and he may be in power today and out tomorrow. Still this ministerial officer and his colleagues in the British cabinet are jealous of the control and responsibility of this super-organization of information and order.

An example of this jealousy of control has been exhibited in London recently in the excision—voluntary or forced is not quite clear—of the brilliant head of the political intelligence department, Sir Basil Thomson. Whether Sir Basil has become infected with the melagomania world epidemic in connection with the war, I do not know, but he declined to serve as chief of that department if compelled to report to the general chief of Scotland Yard, ranking him in his relation to the home office ministry. He would report to the ministry direct but to no intermediary. So, while the thing did not satisfy the cabinet, the members let it go because of the excellent war record of Sir Basil, who was really a great and outstanding personality in connection with the British intelligence (spy) system during the war.



Nevertheless, it being the primary duty of Scotland Yard to protect the person of the king and not less those of his ministers, the opportunity to give him the harpoon, to sacrifice individual merit, perhaps, to red tape and system, came in due course, as all things most certainly do come in England—"in due course."



A group of Sinn Feiners were discovered last summer near "Chequers," the country home of Lloyd George. There was evidently something of a panic at Downing street and it was figured that the prime minister had escaped possible assassination. Unfortunately for Sir Basil the discovery was not made by his men, but the regular police force of Scotland Yard. Another effort was made to have Sir Basil report through his chief, instead of direct to the home office, with the alternative of getting out if he would not. He chose the alternative.

I make these references to Sir Basil for two reasons: first, he is writing a book on the war and post-war functioning of the intelligence department of Scotland Yard, which he will issue shortly, and which may be of interest to American readers; and, second, I speak of him for a more personal reason.

On arriving in London some months ago I bore a letter of introduction from Police Commissioner Enright, of New York, to Sir Basil Thomson, and had

Solving the Problem of Juvenile Delinquency

Legal Father of 3,000 Kansas Boys Uses Original Methods With Success

By CLYDE ROBERTS

WHAT is the answer for the growing tendency toward juvenile crime in the United States?

How many fathers in America, whose sons have gone to prison, reformatories, or industrial schools of correction, have realized, too late, that the fault was their own?

What percentage of the parents in the United States have the absolute confidence of their children?

Are American parents meeting the outside competition of amusements in their homes?

Is there a remedy for the shortcomings of youth, other than the trend of legislation aimed at correcting faults?

Fathers and mothers, are you sure your son is not the next to hit the toboggan toward juvenile delinquency, which later may result in prison?

The foregoing questions will never be solved in a day, nor will they be remedied by any one line of effort; but there is a lesson in the experience of a man out in Kansas who has been the legal father of 3,000 boys, and has given advice to thousands of others.

That man is Judge John T. Sims, of the Wyandotte County, Kansas, juvenile court, who is known as the children's friend.

This article deals only with Judge Sims' experience with boys, and the hypothesis from which he works. He answers many of the questions now confronting parents of America on the juvenile tendency toward crime. In explaining his experience and his application of principle, he does not claim to have a panacea to save the youth of the nation, but he offers his observations for what they may be worth to the parents who have such problems before them.

First, in the calculations of Judge Sims, is the primary hypothesis with which many thinkers already are familiar. That is, that the average normal child will repeat the history of its race in the course of its life.

With the Caucasian race, Judge Sims divides his observations in four grand divisions. First is when the white race were savages on the rivers and in the valleys of Central Europe. Next is when they advanced to the barbarian stage, and third is the age of chivalry. Last is the present age of civilization.

As a savage, man burrowed in the ground for a home. He built a fire outdoors to cook his food. He worshiped idols of his own concoction. He slew his food wherever he could get it, and he went forth upon the face of the earth to get from nature that which would sustain life.

As a barbarian, man learned to organize. He learned the use of weapons. He built more substantial houses. He became more cruel than the savage. He tortured his enemies. He learned to use beasts of burden, and he designed ways and means for his own comfort. He believed that women were only chattel. They had no rights.

In the age of chivalry, woman first received attention from man. It was in this age that man first built the pedestal on which womanhood now rests. And it was in this age that men began to learn that cleanliness of person, chivalric deeds, and other notable things gained them favor with the women.

Now, bring the hypothesis of Judge Sims to the present age, civilization.

The average normal boy will repeat the history of his race. Thousands of mothers would fly at his throat if Judge Sims were to tell them their pretty little boy is a savage, but—

The little boy will dig a cave in the ground, even though he lives in a mansion. He will hunt for his food, even though he be filled with the finest food procurable. He will eat wild berries without regard to danger. He will climb a tree to observe some distant point, or just for the thrill of the risk. He will place value on trinkets of no intrinsic worth, because they are his idols. He is in the savage age of his race, and is normal.

Advance the same little boy a little further. He will make a set of harness and put his dog to work. He will pour hot water on a turtle's back to see it run. He will tie a can on a dog's tail to hear the animal howl. He will make wooden horses out of broomsticks. He is not inherently cruel, but he is a young barbarian. He is in the barbaric stage of his race.

Consider him next in the age of chivalry, when he looks upon girls and women for their charms, rather than as chattel. He becomes conscious of a different feeling toward the opposite sex. He will not shun water; he will take more care of his appearance. He will want nice clothes and the necessary things to entertain girls, because he is passing through the chivalric age of his race.

Examples of this character could be carried on indefinitely, but these given serve to illustrate Judge Sims' viewpoint.

Applying his hypothesis, then, shall come Judge Sims' first element of striking at juvenile delinquency. The parent must understand that boys will do certain things; that it is their nature to do certain things, and from that judgment must learn the exercise of sensible restraint.

If a little boy, as a savage, wants to get in the water, the parents should not employ vigorous restraint, particularly punishment; they should endeavor to teach him to go in water only where there is no danger, or else remove the opportunity altogether.

As a barbarian, if the youth mistreats an animal, gets a gun and shoots a neighbor's chickens or cow, the parent should not punish him by violence, but should advise him against injury to anything.

JUDGE JOHN T. SIMS

In the age of chivalry, if the same boy sees the little girl next door, and desires to take her to a picture show, or buy her some candy, or wants a new tie to gain favor in her eye, he should not be censured for doing something that is part of his nature.

Judge Sims' method of handling boys through these stages is the study of the proper use of restraint. Advise in line with the boy's nature. When force is necessary, make it severe and absolute, without restriction.

Under the Kansas juvenile laws, when a boy is made a ward of the juvenile court, the judge has first authority, even over the parents. He may or may not send the boy to a place of correction. In the 12 years that Judge Sims has served, more than 3,000 boys, whose ages range from five to sixteen, have been his wards, and he learned things from them that their parents never dreamed of, because he worked a system flexible and applicable to the troubles of most boys.

The results have been that few of his wards have ever continued a life of crime or waywardness. Most of them have turned about. There are now in Kansas, men holding positions of high responsibility, who were wards of Judge Sims in their youth.

When a youthful offender is brought in, Judge Sims diagnoses the case before applying the rule. If the youth has been stealing, he finds out why. It might have been that the boy was in the age of barbarism and believed he had the right to steal. It might have been that the boy was in the age of savagery and stole because he knew no better, and the temptation was before him. It might have been that the boy was in the age of chivalry and stole because he desired something that was denied him in his own life.

Once the diagnosis is made, the remedy is sought. If it is theft by instinct, the boy gets advice. If it is theft by conquestial right in the boy's mind, he gets a severe lecture and advice. If it is theft for something the boy could not get or have, then Judge Sims hunts for the reason.

He has found in hundreds of cases that the average American middle and lower class home cannot compete with outside amusements; that parents do not know their children; that authority has been terribly misused on the one hand, and badly neglected on the other.

One boy, 15 years old, who knew better, stole three suits of clothes from a tailor shop. He was arrested. It was his first offense, and the crime was grand larceny, a felony. He admitted the theft, although the clothes he stole were large enough for two like him.

Frightened, accompanied by his mother in tears, he appeared before the court with visions of prison.

Judge Sims sat the boy down on his knee. 'Why did you take those suits—big enough for your father?" asked the court.

"I was tired of looking like a bum."

"Why don't you work and get you some clothes?"

"I do work, but dad says I can't be a dude."

"Bring his father in," said the court, "and we will all talk it over."

At the appointed time, both parents and the boy appeared.

Said the court to the father:

"What is your idea of clothes for this boy?"

"Well, your honor, I want him to look decent, but I won't stand for any of them fancy styles. I want my boy to be raised right. He works and turns in his money at home, but he's got crazy notions about fancy clothes."

"How many suits has he?"

"The one he's got on, and his working clothes."

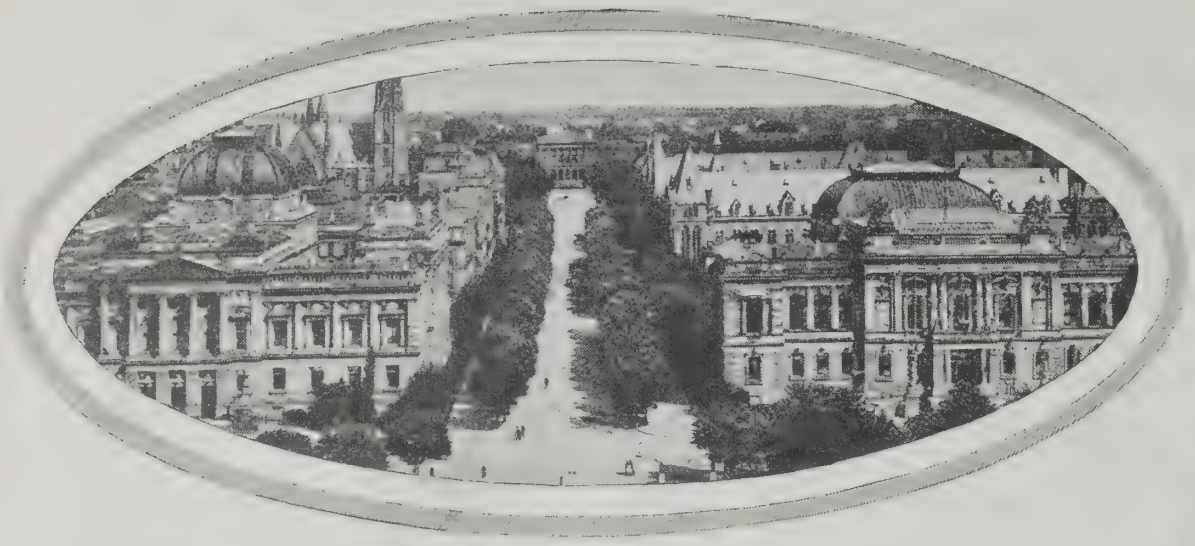
The clothes worn by the boy were out of fashion and badly frayed.

"You are trying to make a criminal out of your boy, and you are getting a good start," said the court. "You are to blame for this theft, although no theft is justified. This boy is in the age where he wants good clothes; where he wants to look like the rest of the young fellows, and if you want to keep him out of the penitentiary, you let him spend some of his money for his clothes, and good ones, too."

"But, judge, I'm boss of my home and I intend to run it."

"I expect you to be boss and this court will uphold any father who is trying to keep the reins, but you must learn to drive if you expect to make a go of it.

"Now, I am going to parole this boy, and make him a ward of this court. From now on I am boss of your home, and I will remain such until you learn enough to run it yourself."



The boy returned the stolen clothes. He was allowed to dress like other boys, and he is now holding a responsible position.

There came before the court 14 boys, all attending a school in the outskirts of Kansas City, Kansas. Near by was a candy storehouse. One boy got the door open, and from then on began a pilgrimage to the storehouse. When the police discovered the theft, the boys had three barrels of candy hidden in a cave and were gorged from eating the sweets. The owner of the candy thought they should all be sent to the industrial school.

On trial, when they faced the court, none more than 13 years old, Judge Sims ascertained that the door of the storehouse was very insecure. He admonished the boys, in confidential, individual talks, not to enter again, and obtained their promise. Then he made their fathers pool together and pay the loss. After that he lectured the owner of the candy to lock his place securely, explaining that candy was a temptation to small boys. Since then the man has not been troubled.

In hundreds of cases, Judge Sims has found that parents do not have the confidence of their children. Through kindness he has gained confidence of boys, from whom parents could not

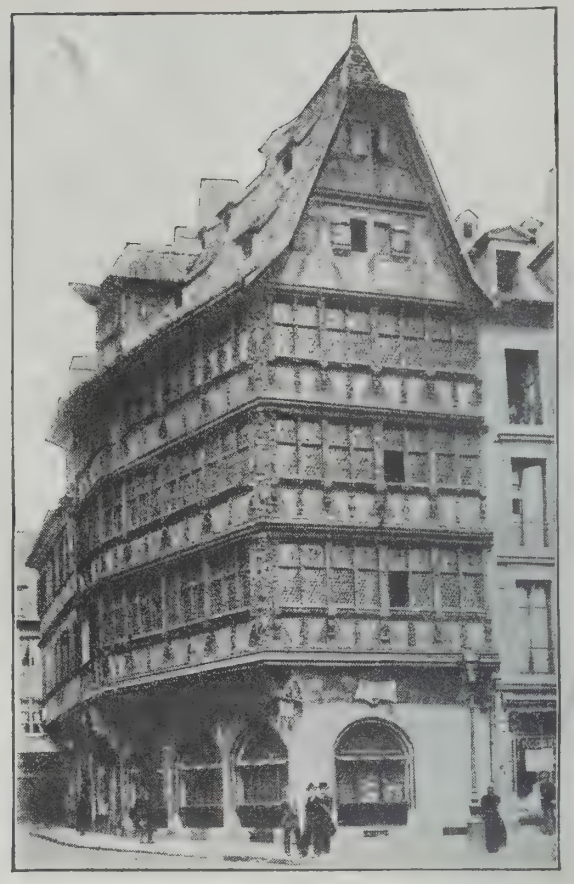
Strassburg, the Recovered City, Is Distinctly Alsatian

Town Is Unaffected by Different Rulers

By PAUL BOWERMAN

MY FIRST glimpse of the Place de la Concorde in Paris was an illustration in a geography book, unfolding to my dazzled eyes that magnificent vista with the obelisk rising in the center and surrounded by eight statues symbolic of the great cities of France. But much more enduring than the details of the picture was the recollection of a footnote to the effect that the statue which represented the city of Strassburg was always draped in mourning in remembrance of Alsace, lost to the French in the War of 1870. Now the last great war is over, the tricolor is flying in Alsace, and the statue of Strassburg takes its place with the seven others. I confess that it was partly because of the sentiment attached to the memory of the picture in the geography book that I went out of my way, en route to Germany, to make my pilgrimage to the recovered city.

As the *rapide de luxe* jolted and lurched over the makeshift roadbed across the battle-scarred fields, sweeping past freshly painted stations built on the ruins of the others, and affording fragmentary glimpses of grass-grown trenches and bundles of rusting barbed wire, it was easier to understand how much Alsace-Lorraine means to the French. Chateau Thierry flashed by, then Epernay, Châlons, and the peaceful-looking Marne.



After Lunéville, the train degenerated to the rank of an *omnibus*, coming to a stop at every village. This made possible a better glimpse of the picturesque houses with their high swift-sloping roofs and overhanging balconies. But if the architecture of the towns had changed, the people themselves were even more different from those of Northern France. As they got on and off the train there was little of the bustle and animation so characteristic of the French, no audible embraces, no waving of hands and shouting of parting injunctions, and no buzz of conversation as they took their places in the carriage. And their language was not French, but a *patois* that sounded like very bad German.

A more sluggish disposition, a certain blandness in their round faces, a suggestion of a greater physique in the men and a tendency toward plumpness in the women were the first noticeable contrasts. There was lacking that intellectual vivacity that illumines the gesture and speech of even the French peasant, and the sharp clear-cut intonation that springs from a quick-working mind. Indications of the Teuton strain came to light in their heaviness of manner, in the moodiness that occasionally stole across their faces.

Night had already fallen, and a cold, dull rain sifted down through the trees of the park that flanked the station when the train arrived at Strassburg. Illumined by the lights of the town some distance away, the great spire of the cathedral rose to a shadowy height, alluringly indistinct. I walked across the glistening square into a German hotel, sat down to a German dinner of sausage and dark beer, was escorted to my room by a German porter, and fell asleep in a thoroughly German bed.

Strassburg is divided into an Old Town and New Town. In the latter are centered the monumental buildings erected by the Germans since 1871. It is impressive in a heavy majestic manner, solid-looking, expensive, and rather tedious. The Kaiser's Palace, now renamed the Palais du Rhin, stands at one end of a handsome square across from the library and the conservatory of music. All these are huge edifices of colored stone, adorned with figures symbolic of Power, Strength, Fertility, and other like virtues, dear to the heart of a Teuton, all carefully labeled and all looking exactly alike. It is perhaps New Art or a perverted imitation of Rodin that is responsible for these gigantic ladies in stone that one finds on every hand—or even a twentieth-century conception of Brünnhilde. Whatever has been the source of inspiration, the result is nothing short of terrifying. At the ends of every bridge and over the portals of every public building these guardian angels, of fearful proportions, look down upon undersized humanity with all the grandeur of physical enormity.

A bridge across the River Ill leads to the open square in front of the university, the exterior of which is the happiest conception of the architects to whom the reconstruction of Strassburg was intrusted. The great size of the building permits the use of rather heavy detail without compromising the picture as a whole. The interior is unfortunately sacrificed to the passion for heavy colors and tremendous columns, where the squat pillars and low ceilings give the impression of needlessly thick walls, and the tinted ceilings, in addition to excluding light, add a touch of solemnity unrelieved by a hint of mystery.

The Kammerzell House, one of the best examples of Alsatian architecture.

There are occasional evidences of a revolt on the part of the French element of the city against the superabundance of statues reminiscent of the German occupation. On the days following the entrance of the French troops there seems to have been a rather whole-hearted jubilee to behead a number of the stone ladies, previously mentioned, whose countenances inspired no feeling of awe in the hearts of the Gallic element. A likeness of Kaiser William was torn from its pedestal, the three of the Prussian kings sculptured on the façade of the new post office suffered a similar fate. A pleasing figure of Goethe in front of the university was left untouched, as were those of the German scholars and scientists.

In the near-by streets of the New Town are endless rows of well-built homes with grilled gateways and doorways adorned with cherubim, all exuding an atmosphere of contented domesticity and comfortable bank accounts. If there were many details that would jar the sensibility of an admirer of things Gallic, there was on the other hand a rather pleasant indication of joviality and quiet industry—virtues of which the world seems to be in sore need today.

It is currently supposed that Alsace-Lorraine had been smarting under the mailed fist of Germany since 1871. It would be nearer the truth to say it was the French rather than the Alsatians who were burning for retribution. In the 47 years that Strassburg was a German city, enormously successful steps were taken to uproot the seeds sown by the French during the preceding 174. The great strides made by the propaganda of the last German occupation is explained by the strong appeal which the Teuton civilization makes to the middle and lower classes. In any region lying between France and Germany, such as Luxembourg and portions of Belgium and Switzerland, it will be noted that the educated classes champion the French civilization of culture and refinement, while the lower classes invariably find their expression in the slow, contented accents of German. Add to this that the Kaiser spared neither money nor effort to efface as rapidly as possible the last vestiges of the French régime, and the shock of the stranger in seeing what seems to be a German city is explained.

Thus situated as a buffer between two rival powers,

Making a Calendar for a Billion Years

By HARRY H. DUNN

The Lick Observatory on Mt. Hamilton, whence Dr. R. G. Aitken, astronomer, will go as one of the delegates to the meeting of the International Astronomical Union in Rome.

WITH the object of formulating a calendar which shall endure until the end of time, and on which every separate day of each week shall always fall on the same day of the month, delegates from every civilized nation in the world will meet at the conference of the International Astronomical Union in Rome, in April of this year. It is estimated that, if such a calendar can be arranged, and the world can be persuaded to adopt it, as, for example, it adopted standard time, such a calendar would save annually more than $40,000,000 in the re-writing, printing and lithographing of new calendars for each succeeding year. The saving in time and money along other lines, by this reform of the Gregorian calendar, would be approximately $200,000,000 a year, according to estimates of those astronomers and other scientists who are endeavoring, in every country on the globe, to bring about this uniform, perpetual division of the year into its 365 parts.

At the conference in Rome, the international committee of the astronomical union will present a report on the form of calendar it has found most suitable for permanent adoption by the world. What form this will be, none but the members of the committee know, but at this time, three forms of perpetual calendar have been offered for the consideration of the world's astronomers, and other authorities on the passage and reckoning of time. One of these is the American Plan, now concretely presented in the form of a bill pending before Congress; another is the Swiss Plan, formulated by M. Armelin, and the third is the French Plan, originated by M. Bigourdan, an astronomer in the Observatory of Paris.

The American Plan, or Liberty Calendar Plan, has the great advantage that it divides the year into months of exactly even and equal numbers of days, namely, 28, making it very convenient for employers and employes, bankers and accountants, in short, all forms of industry, business and commerce, since the first and fifteenth of every month would come on Monday, and thus, all pay days, whether weekly, semi-weekly, or monthly, would fall at the end of the week and on week days. The advantage to those paying interest on borrowed money is at once apparent, since they would pay interest on the exact number of days in every instance. Rent payers similarly would be benefited, while those lending money or owning rental property would lose nothing. All notes and contracts could be drawn so that they never would mature on Sunday, and the matter of fixing a future day of the week for a certain date would be comparatively simple, and no recourse to a printed calendar would be necessary. All semi-annual payments, notes, mortgages, taxes, and so on, would fall due on Monday, January 1, and on Monday, June 15.

While the new number of months proposed in this American Plan is not easily divisible, being 13, the number of work days in a month, 24; the number of weeks in a month, four; and the weeks in the year, 52, are all easily divisible. This is important, since fully 99 per cent of all settlements involving time are by the hour, week, day or month, and not by the year. The year can be divided into quarters under this plan very easily, each quarter containing exactly 13 weeks, and each quarter commencing on Monday. Under the present system, the quarters are of three different lengths, and commence on different days of the week. A glance at the Liberty Calendar, proposed under this plan, and shown herewith, shows that every day of the month always would fall on a certain day of the week. In every month until the end of time, the first, eighth, fifteenth and twenty-second always would fall on Monday; the second, ninth, sixteenth and twenty-third, always would be Tuesday, and so on. One would always know the day of the month as easily as he now knows the day of the week, and one printed calendar would last forever.

It is proposed to dispose of the thirteenth month by introducing it between February and March, and naming it "Liberty," or "Vern," the latter in honor of the vernal equinox. The 13 months of 28 days, would thus form a total of 364 days. To provide space for the 365th day, a New Year's Day—not named as a day of the month or week—would be placed between December 28, which always would be Sunday, and January 1, which always would be Monday. To provide for the extra 366th day every four years, it would be inserted between the twenty-eighth day of June and the first day of July, once every four years, and called "Leap Day," likewise having no status as a day of the week or a day of the month. Both would be international holidays.

As direct and logical as this plan seems to be in theory, there is considerable opposition to it, especially in America, where it originated, and one of the strangest features of this opposition is that, in this educated and enlightened nation, the strongest objection to it is the addition of a thirteenth month. This may be said to be pure superstition.

The really fatal defect in the American Plan, according to astronomers, is that it would create an extra month's work every year for all banks, commercial houses, industrial firms and accountants all over the world, and it is extremely improbable, according to certain American authorities on the subject, that the financial interests of the world would allow the injection of this extra month into the year without the strongest opposition.

Dr. W. W. Campbell, director of the Lick Observatory of the University of California, at Mt. Hamilton, from which Dr. R. G. Aitken, astronomer, will go as a delegate to the April conference in Rome, supports the financial interests in their opposition to the additional month, and brings forward a psychological factor which, although it seems apparent, also seems to have been overlooked.

"Personally," says Dr. Campbell, "I am very far from convinced that the intelligence of the world wants, or would be satisfied with, a calendar of such uniformity and monotony as that proposed by the advocates of the thirteenth-month-year plan. A little variety is one of the spices of life."

Then Dr. Campbell, who has been working on this problem of the reform of the Gregorian calendar for some years, brought up the Swiss Plan, as presented some years ago to the Societe Astronomique de France, and lately revived by the Paris Academie des Sciences. This calendar is the original conception of M. Armelin, and of it Dr. Campbell says:

"From the many and varied proposals which retain the year of 12 months, but principally from M. Armelin's calendar, I have selected the features which seem best to me for a perpetual calendar, as follows:

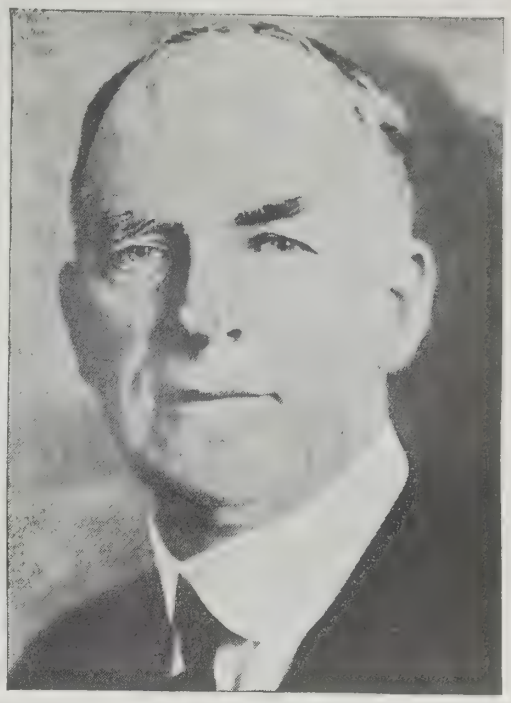
1. The year of 12 months to be divided into four quarters of three months each, and the arrangements for the first quarter to repeat themselves precisely in each of the other quarters. The first month of each quarter has 30 days; the second month, 30 days, and the third month, 31 days. This accounts for 91 days in each quarter, or 364 days in all.

2. The remaining day in ordinary years is 'New Year's Day.' It is given no other descriptive title. It does not belong to any week or to any month. It begins the year, but January 1 is the day *following* New Year's Day.

3. The 366th day of leap year is likewise an extra day, bearing an appropriate descriptive name, perhaps 'Leap Day,' but no week day name, nor is it a part of any month. It is the day following December 31, and the day preceding New Year's Day. It is assumed to be a holiday, and, as it comes only one year in four, it could follow June 31, if preferred.

4. January 1 always falls on Monday. From this, it results that the first month in each quarter—January, April, July, October—begins on Monday in each and every year; that the second month in each quarter—February, May, August and November—begins always on Wednesday; and that the third month in each quarter—March, June, September and December—begins always on Friday. The first day of the month never falls on Sunday; the fifteenth day of the month never falls on Sunday; the thirtieth day of the month never falls on Sunday; the last day of each quarter—the thirty-first of March, June, September and December—always falls on Sunday. The 30-day months always have four Sundays each, and the 31-day months always have five Sundays each. The number of 'week days' in the month is 26 for each and all of the 12 months.

"The advantages of this simple system must be evident," continued Dr. Campbell. "The months are as nearly equal—as nearly equal as they can be made in a 12-month year—and in working days they are absolutely equal. Any given date of any month always falls on the same day of the week. Each stated holiday falls on its invariable day of the week. Thanksgiving Day, for example, always will be on November 30, Christmas Day always on Monday, Independence Day, always on Thursday, and so on."



Though Dr. Campbell considers this by far the best of the three principal systems offered, the proponents of the American Plan, or the Liberty Calendar, as they call it, have raised certain important objections to it. They say it has two fatal defects: First, that the weeks do not fit the months, and, second, that the months are still of two different lengths. These two defects, it is undoubtedly true, are overcome by the Liberty Calendar. In regard to these objections, Dr. Campbell says of the Armelin Calendar:

"It is recognized by everybody that the proposed break in the succession of the week days is a most serious matter. In view of this fact, M. Bigourdan, astronomer of the Observatory of Paris, proposed a calendar which does not break the continuity of the weeks. It is an improvement over the present (Gregorian) calendar, in that the year is divided into four unequal quarters of three months each, with 31 days in the first month of each quarter; 30 days in the second month of each quarter, and 30 days in the third month of the first three quarters, but 31 days in December, with the extra day of leap year added to November, making that a month of 31 days every fourth year. In leap years, then, four months in succession will have 31 days.

"Bigourdan's system has the advantage of making the months a little more equal than they are at present, and of simplifying slightly the run of the days through the year, but the first day of the months, a given day of any month, and the holidays, fall on different days in successive years, as in the Gregorian calendar. His calendar, therefore, is not perpetual, and would have to be reconstructed and reprinted for every year."

Whichever calendar is chosen by the Rome conference, it is apparent that there will be opposition to it.

The prime motive back of the movement to reform the calendar, of course, is to provide greater convenience for all users of the calendar. The foundations of the present calendar system were laid by Julius Caesar. His system was altered and improved by Pope Gregory XIII in 1582.

DR. W. W. CAMPBELL,
Director of Lick Observatory.

American Perpetual Calendar

THE American, or Liberty Calendar Plan, which is now pending in the form of a bill before the present session of the American Congress, provides for 13 months of exactly 28 days each, with 24 working days in each. Under this calendar, every month for the next million, or trillion, years, would be just like this:

Mon.	*Tues.*	*Wed.*	*Thurs.*	*Fri.*	*Sat.*	*Sun.*
1	*2*	*3*	*4*	*5*	*6*	*7*
8	*9*	*10*	*11*	*12*	*13*	*14*
15	*16*	*17*	*18*	*19*	*20*	*21*
22	*23*	*24*	*25*	*26*	*27*	*28*

By this calendar, the first of every month would fall on Monday, and the last, of course, on Sunday.

Armelin Perpetual Calendar

THE table below outlines the calendar reform which is to be undertaken by the International Astronomical Union at its meeting in Rome in April, 1922. It is a perpetual calendar, good forever, and needs to be printed only once.

New Year's Day.

First quarter	*January.*	*February.*	*March.*
Second quarter	*April.*	*May.*	*June.*
Third quarter	*July.*	*August.*	*September.*
Fourth quarter	*October.*	*November.*	*December.*

Leap Day.

Monday	*1 8 15 22 29*	*6 13 20 27*	*4 11 18 25*
Tuesday	*2 9 16 23 30*	*7 14 21 28*	*5 12 19 26*
Wednesday	*3 10 17 24*	*1 8 15 22 29*	*6 13 20 27*
Thursday	*4 11 18 25*	*2 9 16 23 30*	*7 14 21 28*
Friday	*5 12 19 26*	*3 10 17 24*	*1 8 15 22 29*
Saturday	*6 13 20 27*	*4 11 18 25*	*2 9 16 23 30*
Sunday	*7 14 21 28*	*5 12 19 26*	*3 10 17 24 31*

New Year's Day	*New Year's Day.*
Washington's Birthday	*February 22, Wednesday.*
May Day	*May 1, Wednesday.*
Memorial Day	*May 30, Thursday.*
Independence Day	*July 4, Thursday.*
Labor Day	*September 4, Monday.*
Christmas Day	*December 25, Monday.*
Leap Day, following June 31 or December 31	*Leap Day.*

"American Magazines Are Going Blooie"

Secret Recipes for the Piffle Which Forms the Public's Mental Pabulum

By a Professional Magazine Writer

THERE lies before me the front page of a newspaper that is published and has big circulation in the city whose population is supposed to average the highest in intelligence of all like city populations in America. The next to the outer right-hand column contains a news story concerning a young man under sentence of death for murder. His was a brutal and stupid crime, consisting of the slaying, in process of robbery, of a well-to-do business man, and, in process of attempted escape, of a detective sergeant. The story has to do with attempts being made to save him from the gallows. Those attempts consist, chiefly, of appeals to the executive authority for commutation of sentence to life imprisonment. The appeals are based on the claim, attested by specialists, that, for lack of intelligence, the young murderer is not fully responsible for his acts. It is set forth that he comes from a family of weaklings, that his grandmother died in an asylum, that his mother has the intelligence of a 10-year-old child, and that his mentality is not above that of a moron.

The outer right-hand column of the same newspaper—the prime position in any issue of a newspaper—contains the beginning of a series of signed articles "by" the youthful criminal! The article is in good newspaper English, well-constructed, and containing language and thought which only a person of intelligence could employ, and, withal, displaying the technique of the trained writer!

All They Want Is Name of a Notable

OF COURSE, the young criminal did not write it. It is doubtful, if what they say about his mentality is true, that he could understand it after it was written "for" him. Yet the newspaper in question broadcasts before its readers the articles in question as "exclusive" and representative of great enterprise on its part, playing up the "moron" as a writer as seriously as if he were an H. G. Wells.

Pretty raw, you say, and superlatively cheap. You probably will add that such trifling with the intelligence of its readers is engaged in by only the "yellow" type of newspapers. Substantially, that is true; the better types of newspapers don't do it—certainly not so blatantly and speciously.

You probably will be astonished, however, when you learn that publications other than newspapers, frequently publications that affect toward all newspapers a loftiness that is mountainous, do what is practically the same thing. And this writer often has done it for them.

In the distant future, as an illustration of a specific instance, some student delving into bound volumes on the shelves of a library for "material" of this period having to do with a certain national subject of current discussion will find a magazine article "by" the supposedly highest authority on the subject in question. In fact, it is "by" a member of the President's Cabinet, the one in whose department the subject in question is being determined. The student very probably will quote from that article, which to some extent may get into the histories of the future and become something of an "authority" as to the subject with which it deals. The writer fain would hope that such will be the case; for he and not the Cabinet member whose name adorns it wrote the article in question. He wrote it without even talking with the Cabinet member, whose only direct connection with the matter in question was to give the manuscript a hurried reading before authorizing its publication as his own. It wasn't a case of deceiving the editor of the magazine; he requested that it be done. All that he cared for was the Cabinet minister's name as a "contributor" to his publication, and to get that he was willing to publish anything the said Cabinet minister would "stand for."

They Assume That Readers Are Stupid

SUPPOSE the editor had inserted with the article a little explanatory note like the following:

> "TO THE READER: This article by Secretary So and So was written by Mr. So and So, whom we paid $34.50 for writing it and getting Secretary So and So to permit his name to appear as its author."

How much respect would you then have for the magazine in question? Yet every word of the above is true, even to the amount of payment. The fee is mentioned to bring out the most pertinent phase of the incident.

The mechanical work of much writing is done by others than the "author" under whose name it appears. Such can be an entirely proper proceeding. A man may have great ability in other lines and yet not be a master of written expression. With the aid of a technician, such a man can often express himself more truly than if he wrote without help. Some of the world's most noted productions have resulted from collaboration between the man with the material and the man with skill for writing. Washington's Farewell Address, for instance, was written by Alexander Hamilton and only revised by Washington. But Washington supplied the thought; Hamilton dressed it up. Then there is the Andrew Jackson story:

"What did they think of my message?" he asked of a Congressman.

"They say it is a great document, but that you didn't write it," the Congressman replied.

"But don't I deserve more blankety-blank credit for finding the man who could write it?" President Jackson responded.

The offense on the part of certain types of magazines in cases like that noted in the foregoing is not primarily in using written matter prepared by others than the one who is credited with it, but in using it chiefly because it bears a name of prominence. The sum paid for the writer's work on the Cabinet member's article in question will give some notion of the amount of time that was devoted to the study of the subject in question by the man who did the writing.

The magazine in question doesn't belong to the "cheap," but to what might be termed the "high-brow" class of publications. It hasn't a reader probably who wouldn't see through and feel contempt for the newspaper practice mentioned in the beginning of this article. Yet this writer asserts, as one who makes his living writing for the magazines, as well as one who has been through all stages of newspaper experience and as an inveterate reader of all kinds of matter published, that, taken as a whole, the intellectual if not the moral standards of the American newspapers are above those of the American magazines—which, oddly, usually are treated as being beyond criticism.

Do not fail to note the phrase "taken as a whole," for with the worst type of newspaper and the best type of magazine there is no comparison.

There are several American magazines of the very highest standards in every way. The average of all, this writer is prone to believe, deserves, however, *Life's* satiric characterization to the effect that they are "dedicated to the proposition that all persons are born equally stupid." Most of them—and especially the self-styled "popular" ones—assume that their readers have no intelligence, are incapable of thinking and have little concern for anything that doesn't appeal to the most primary instincts.

That the foregoing is not the exclusive opinion of a "disappointee" in the much-pursued art of writing for the magazines, let me say that the writer of this has written successfully (as proved by a livelihood gained via checks) for the worst as well as the best of them. It is concurred in by many who have been much more successful with them. Recently, a famous mid-western writer, who runs a small newspaper and for years has been besought as a contributor by most of the magazines in the country, spoke before a club in the East on the newspapers. He didn't fail to belabor the daily newspapers, though for a lifetime he has been identified with them. During the question-naire period at the close of the lecture, some one shot at him this question:

Not Worth Discussing, He Says

"WHAT do you think of the magazines?"

"I don't think they are worth discussing," he replied, immediately. "The American magazines simply are going blooie."

Yet a week rarely passes without his name being "played up" by one or more magazines. He is a writer of first-class ability, but it is not because of that that the magazines which seek him most want him as a contributor. It is because years ago, before American magazines multiplied to the point of weighting down news stands on every corner and when those that were published had high standards (as the same ones which survive in the main still do), he became famous as a magazine contributor. Now that his name has selling value, he is besought by the editors of the new and, in point of circulation figures, often the dominant types of periodicals. What they want most is his name, not his talent; and no one knows that better than the writer in question; hence his contempt.

Not very long ago this writer spent an evening in the home of one of the most successful editors of the "popular" type of magazines; he has been assistant or chief editor of several, ranging from a weekly to a 35-cent monthly. It was noticeable that not a single magazine was to be seen in the living room or in his study.

"Don't you read magazines?" he was asked.

"I thought I looked like a person of intelligence," he replied cryptically. "Do you think I'd voluntarily read any such rot as we publish?"

On discussing the subject further, it was learned that he confined his reading of periodicals to a few and mainly little-known publications that are put out inconspicuously, or to others published abroad. The very sight of a garish magazine of the type he edited was sickening to him.

Only recently several editors of all-fiction magazines of the "popular" type in a discussion with a group of amateur writers stated candidly that, as readers, the stuff they buy and publish would have no interest for them. One declared, with further frankness, that if Edgar Allan Poe were living and submitted to his magazine stories like those which help to make Poe immortal, they would be rejected.

Succinctly, the editor of the "popular" type of magazine buys not what he thinks is good and worth while, but what he believes will sell most widely. There are exceptions, of course. The writer has in mind the editor of one of the most successful of all the so-called "populars." He does like the stuff he accepts and prints; hence, despite its shallowness, it goes over triumphantly. For behind it there is editorial sincerity, which necessarily must extend to the writing, too. Though much of it may be little more than trash, it is honestly done, which gives it a worth-while value.

Thus with the run of "popular" magazines, neither the editors who shape their policies nor the writers who supply the "food" which they feed to the minds of their readers have any faith in what they are doing. Even where no propaganda incentive issues from ownership established for using rather than for profiting directly from the properties, the operation of the average type of "popular" magazine is a pure and simple commercial proposition. Circulation—quick circulation—big circulation—is the god and the only one that is worshiped. Because the "yellow" newspapers found that the best way to build big circulation quickly was to assume a state of general public stupidity and act upon it, the "popular" magazine seems to take it for granted that such is the only way not only to build but also to hold big circulation.

The "popular" magazine rarely gets the "toning down" which is given the yellow newspaper after circulation is established. They go from one trick to another and heap artificiality on artificiality. The reading matter they print usually is a secondary one in the group of important operating items. Pictures, for those that use them, rank much higher. More energy is given to the selection of covers and illustrations than to reading matter. Editors usually are paid more than is paid to writers who prepare the articles or stories. In spite of denials, "names" count for much. There are magazine writers who find it much more profitable to write stuff which appears under the names of public men, actors or actresses, movie stars, prize fighters and criminals, than to use their own names. While, as noted, there are creditable exceptions, some of the apparently "best" magazines, that is, some which seem to make a truly intellectual appeal, are not above employing cheap legerdermain, as in the case of the article "by" the Cabinet member already told about.

Market Closed to New Ideas

WHEN some theatrical man excused his flimsy productions on the score of the "tired business man's" reluctance to think when off duty, there was coined a phrase which since has dominated the editorial offices of 75 per cent of our American magazines. Even self-styled scientific publications and would-be serious business periodicals often are edited with the T. B. M., as the term now is used, chiefly in view. Likewise, many of the women's magazines are edited for—to borrow H. L. Mencken's phrase—the fat woman in a kimono, lolling in a hammock and fanning herself.

The result is that what the average magazine publishes consists mostly of prettily garnished, and sometimes highly seasoned, piffle. The short fiction always must be "uplifting," "inspirational" and optimistic in tone. The "happy ending" is decreed almost as invincibly as in the motion pictures. When a new writer tries to open up a new approach to the art of the short story, the one necessary essential to success—a market—is almost entirely absent, despite the fact that we are the greatest readers of short stories in the world and more of them are published in this country than in the rest of the world. Such a writer generally must battle his way to notice through obscure magazines that are unable to pay for material. It is worth while noting that the fiction published by several of those non-paying magazines are given much higher rank by students of the subject, like O'Brien, than that which is published by some whose rates of payment are dazzling. The articles in the average "popular" magazine merely skim the surface of things. Above all they must not give offense—to either reader or advertiser.

Best Writers Leaving Magazine Field

UNLESS the name of the author is sufficient to make the article "stand up" regardless of the piffle it contains, virtually the only requirement is that the treatment of the subject be clever. The caption or title must have "punch," the writing must be "snappy," and in writing it the author must assume that the reader will be in a condition of semi-somnambulism when the magazine is "perused." For the last dozen years both magazine fiction and articles, also verse, have been falling into the deadly grip of standardization. One of the great problems of magazine editors just now is to find writers who can do something new; and conversely the occasional new writer with something new faces the problem of finding an editor bold enough to give him a chance.

Meantime, the average American magazine is ceasing to be a factor in the intellectual and moral life of the country. It has become a source of light entertainment and little more. The growth of newspaper syndicating, and the bigger opportunities it opens up for them, is causing many of the best magazine writers to go back into daily journalism, and at the same time—along with other influences—is enabling the better types of newspapers to be better magazines than the average of the magazines themselves. Whatever may be said of the newspapers—and much that is not pleasing can be said of them—they still certainly are "worth discussing." Of course, there are numerous individual magazines that also are "worth discussing," but when one looks over the heavily laden racks of the ordinary news stand and notes the types and characters of most of the biggest sellers thereon, one must feel that the contempt expressed by the noted writer hitherto quoted is not wholly unmerited by the magazines as a whole.

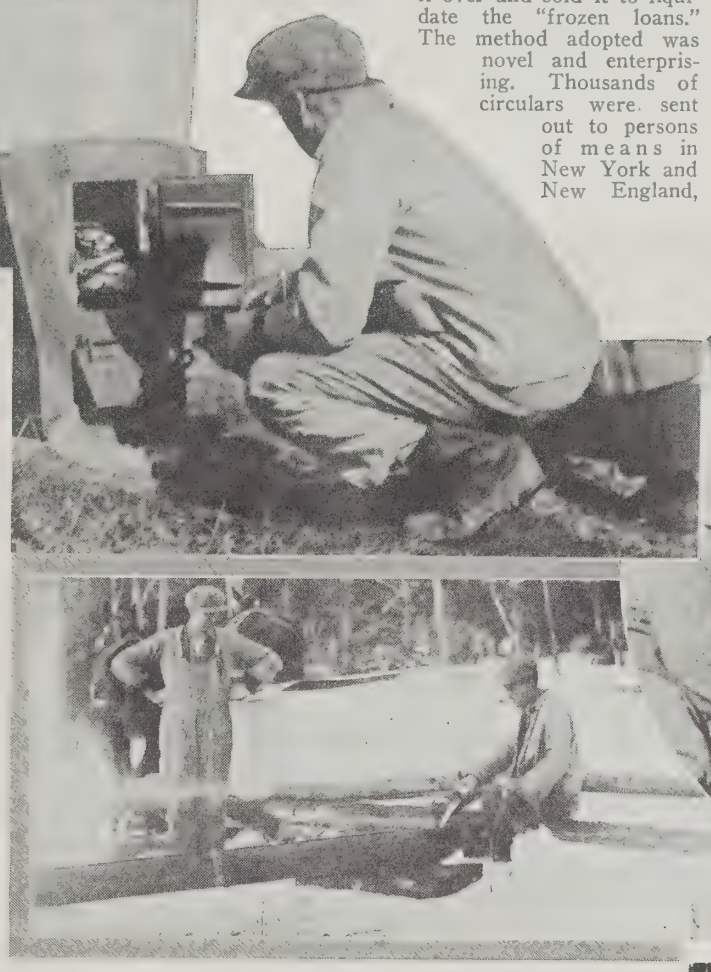
When It's Maple Sugar Time in New England

An outdoor sap boiler for the "sugaring off" party.

ONLY those who live in New England, Northern New York or Eastern Canada know the real delights of Maple Sugar Time—those days in late March or early April, according to how the sap runs in the sugar maple trees, when the trees are tapped and the life-giving sap is taken and boiled down into delicious syrup or equally delicious sugar. There is never enough to supply the demand, which has become world-wide. Those who know the products of the sugar maple tree only as something that appears on the table should visit a maple grove or "sugar bush," as it is generally called in New England, when sugar making is in progress to get the full enjoyment of the delicacy.

When the soft south winds begin blowing, when there are thawing days and freezing nights, the work of making maple sweets begins. Trees are tapped and tens of thousands of buckets are in use in the north country. Some persons think that the sap rushes from the trees as water gushes from a faucet. On the contrary, the flow of sap is slow—exasperatingly slow, especially to the small boy waiting for his first drink of it. Only a few quarts flow from a tree in a day. It looks much like water, and has only a slightly sweetish taste.

It is hard work wading and wallowing through the soft snow to tap the trees one after another and then go back over the same trail to gather the sap. There are no union rules in the sugar camp, and there's no extra pay for overtime. It's a 24-hour day, and some one must be on duty every hour of the 24, after the work has really begun.



A few orchards are so located that pipes may be laid to lead the sap directly from the tree buckets to the tank in the sugar house, and much toil is thus avoided. In most cases, however, the trees are on level ground, and pipes are not feasible. The team is driven through the wood, each individual tree is visited, the sap poured from the bucket into a gathering pail and from that transferred to the tank mounted on a sled. When the round is completed, or the tank is full, it is hauled to the sugar house, and the sap run in through a wooden trough.

In early days the old potash kettle was used most frequently—the one used at other times by the farmer's wife for boiling soft soap. Open to the weather, rain and snow, while the sap was boiling, bits of wood, bark and leaves dropped in, filling the syrup or sugar with impurities. All this is changed, with modern methods of handling the sap and making the sugar. Improvements in methods cover a wide range. The earliest sugar makers cut a gash in the tree with an axe and inserted a chip for the sap to flow over into a trough hollowed from a basswood log. The old pod auger was used to bore a hole two inches or more in diameter and a spile made from a piece of alder limb was inserted. Wooden buckets replaced the hollow trough. But both these absorbed some of the contents and set up a fermentation that injured the product.

Then came metal spouts and buckets, and the hole bored in the tree is scarcely large enough to insert the tip of the little finger. The open kettle has given way to the evaporator, and the process from tree to tin can of sugar or syrup has been shortened as much as possible, for the less the exposure to the air, the lighter is the color of the sugar, and the higher price it brings in the city market.

Nearly 20,000,000 maple trees in the "north woods," which means New England and lower Eastern Canada, are tapped every spring. Some of these have yielded sap for approximately a half century without apparent injury. An output of three pounds of sugar to a tree is not unusual, and if that figure is maintained throughout the season and for all producers, the maple sugar production makes quite a respectable addition to the saccharine supply of the country. Since it is a delicacy, it naturally brings a much higher price than ordinary sugar.

The maple sugar harvest in 1916, which was a banner year, amounted to 4,106,418 gallons of syrup and 14,060,206 pounds of sugar, valued at $5,117,809, which was a slight decrease, however, from the value of the product of the year before. Last year, due to general business conditions, an enormous amount of maple sugar was tied up in Vermont, and the local bank in one town, which had loaned a considerable amount of money on the product, finally took it over and sold it to liquidate the "frozen loans." The method adopted was novel and enterprising. Thousands of circulars were sent out to persons of means in New York and New England, quoting prices, which were attractive, and guaranteeing quality of the product. This latter fact in itself was almost enough to sell it quickly, for thousands of buyers are "stung" annually with fake maple sugar.

Unloading sap from portable tank and running it into sap house through a wooden gutter.

New England leads all other sections of the country in the number of sugar maple trees in use, and Vermont leads all the New England states, with 5,000,000 trees tapped annually. Vermont has nearly as many more in reserve that can be brought into use whenever the price of maple sugar warrants.

Canada has extensive maple forests and might make as good maple sugar as Vermont, but modern methods have not been generally adopted, and Canadian sugar is not up to the quality produced in New England. Yet it sells for a good price.

Only when "sugaring off" comes does one get the enjoyment of the sugar camp. Daily labor is drudgery, sticky, smelly drudgery. The sticky juice gets into the hair and clothes. It used to be said of a man a little less cleanly than his neighbors that when he was thrown against the sugar house and stuck there, the sugar season was half over.

The "sugaring off" is made quite a neighborhood event. The sugar maker provides the sugar, the guests do the rest. They come laden with pots of coffee, pies and doughnuts, pickles and cold spareribs, roast chicken and "scraps" and home-made bread such as Hoover never heard of, and some proud housewife brings along a jar of damson preserves. When boiling has reached a certain point, which is 230 degrees Fahrenheit, the syrup is tested. A wooden paddle—it might just as well be a spoon, except that custom forbids, is dipped into the evaporator or boiling tank and the liquid is poured from it on the clean snow about the camp. It should not crystallize for present purposes—it should merely become waxy. Sometimes the process is varied by dipping out some into buckets, but not until it has become "grained" by constant stirring. When it assumes a wax-like consistency on the snow, like spruce gum that has been chewed, until it is "made," the sugar is ready to eat. It is "chewey." It cannot be eaten like candy, or fudge, nor dipped with a spoon. It must be chewed.

This maple sugar gathering, the "sugaring off," is about the last survival of the quaint old New England festivals. The husking bee, the barn raising, the chopping bee, have all disappeared, except as an occasional entertainment for the "city folks," and no one now thinks of inviting the neighbors to a quilting or an apple paring to prepare apples for the annual drying. Rural festivities have largely been ruined by machine-made rugs, canned fruits and ready-cut houses. The "sugaring off" remains and if manufacturers carry further the making of syrup from corncobs and walnut bark, even the old-time sugar making may disappear. To have ideal conditions for sap flow, alternate freezing and thawing are needed. There should be a temperature of about 25 degrees at night and 55 degrees during the day. These temperatures, with damp, northerly winds, produce ideal conditions for "sap weather."

Boys enjoying the new warm sugar.

Emptying a tree bucket.

Maple sugar making originated with the Indians. There is an interesting Indian legend about the sugar maple, as told by Rowland E. Robinson:

"While Woksis, the mighty hunter, was one day in search of game, his diligent squaw, Moqua, busied herself embroidering him some moccasins. For the evening meal of her lord, she boiled some moose meat in the sweet water from a maple tree, just by the wigwam. Becoming interested in her work, she forgot the moose meat and the sweet water boiled away to a thick syrup.

"When Woksis returned, he found such a dainty morsel ready for his supper as he had never before tasted. The chief devoured the viand, and then went out and told his tribe that Kosed Kusbeh, a heaven-sent instructor, had taught Moqua how to make a delicious food by boiling the juice of the maple."

Strassburg, the Recovered City of Alsace

Concluded from page 8

and having been bandied about from one hand to the other at odd times during the last two centuries with little or no regard to her own inclinations, Strassburg finds herself in the hands of the French. And if a city can partake of the attributes of a personality, it might be said she appears even yet in a state of mild bewilderment at the necessity of adjusting herself again to new conditions.

Quite early one morning I started from the Place Broglie to make an exploration in the Old Town, and in two minutes I had left both France and Germany behind and was wandering in a labyrinthine maze of crooked streets hemmed in by the tall sloping roofs of Alsace. Almost every building seemed to have been built centuries ago, in the days when a man made his dwelling with his own hands, taking pride that his handiwork was as beautiful as his skill and patience permitted. There were carved doorways with figures sculptured on the panels, sagging now from the ravages of time and rain; stone façades adorned with carvings of intricate pattern—the martyrdom of a saint, the Holy Family, or a likeness of some esteemed ancestor: aging shop-fronts with designs painted in faded colors on the upper stories. Occasionally, I passed a new building, constructed in imitation of the old ones, resplendent in gay colors and freshly carved figures.

In the Place Gutenberg, dominating the busy square, stands the striking statue of the inventor of printing, executed by David d'Angers. In the Middle Ages, when Strassburg was a free city, Gutenberg came here from Mayence, his native city, and during his stay of 15 years was supposed to have perfected his process of movable type.

At every corner and through every opening between the roofs, I could see the great spire of the cathedral rising to a dizzy height, with the sunlight enriching the warm color of the reddish stone. Yet I resisted the temptation to make straight for it, waiting for an opportunity to approach it from a more favorable angle, to seize the full effect of its magnificence.

Full of life and movement, a market in a near-by street was offering the produce of the countryside to the housewives of the city. Under a recessed arcade a confusion of stalls and carts were piled with vegetables. The most striking feature of the lively picture was the peculiar headdress of the country women, the distinctive mark of an Alsatian. Two enormous bows of black silk, at least two feet in height and six inches in breadth, served them as hats. The peculiar effect of these odd-looking bows, combined with their short starched skirts and puffed sleeves, gave an impression of witnessing a performance of life-sized dolls animated by some mechanical contrivance. Some of them wore bodices of red velvet and stomachers adorned with a profusion of silver needlework, and many clumped about in the heavy wooden shoes proverbial with the European peasant.

Another short street so narrow that the balconies of the houses on either side almost touched overhead came to an abrupt stop on the bank of the River Ill, an indolent stream that winds leisurely between the ancient buildings of the Old Town. A tiny park was cut from a jumble of painted roofs, and bearing a name as picturesque as itself—The Ancient Market of the Milk Pigs. But two minutes from the lively scene I had left behind, the hidden nook was quiet and deserted, breathing an atmosphere of reflection, as if silently brooding upon the decades and centuries it had seen come and go. The unruffled water of the Ill moved silently under the succession of graceful bridges of darkened stone, its calm bosom undisturbed by the ripples of a single boat.

Again I plunged into a bewildering tangle of crowded streets, my eyes fixed on the spire that appeared at every turn. Coming out on an open square I turned a corner. At the end of a short street rose the cathedral of Strassburg, majestic in its breath-taking height.

In the thirteenth century, Strassburg was a flourishing city, due to its strategic position as a link between the lands east and west of the Rhine. At this time the work of building the cathedral was begun, and a short time later the construction of the façade was intrusted to a master architect, Erwin von Steinbach. At the end of the fifteenth century the great spire was added, and the people of Strassburg rested content, rejoicing in the result of their labors, and satisfied that they had bequeathed to posterity a fitting monument to the glory of their city.

A midday sun fell full upon the façade, so happily conceived in a combination of solidity and grace, bathing the red sandstone in a warm sparkling brilliance. The upward effect of the elongated windows was tempered by the horizontal lines that marked the stages of the towers, and over the central portal a great rose window caught the eye. Not a line but seemed to harmonize with the others, not a stone but contributed something to an ensemble that expressed so beautifully and simply the grandeur of this house of worship. And still dazzled by the sunlight, flashing from column to column and window to window, I approached the doorway, and passed under rows of sculptured saints. The sudden transition from the brilliance of the square to the silent obscurity of the interior was startling. In the first glimpse nothing at all was visible, as if I had plunged into a gigantic cavern. Then little by little details formed themselves—a row of massive columns looming into an unlighted vault, and at the opposite end of the church the dull reds and blues of a stained-glass window stood out in relief. The great width of the aisle lends an air of spaciousness seldom found in a Gothic cathedral, and in the half light that filtered through the colored windows the interior seemed incredibly vast, so vast that I could believe myself in the open air under a twilight sky.

For an hour I wandered about, attracted from spot to spot by the discovery of one beauty after another, chancing upon the tomb of Erwin von Steinbach, who toiled so many years ago; going from chapel to chapel, and turning around often to catch the effect of the sunlight dancing through the rose window of the west façade. It was restful and satisfying and inspiring.

In the south transept is a giant clock, constructed in the early part of the last century by Schwilgué, a famous clock maker of Strassburg. Every day at noon a crowd gathers to watch the curious contrivance go through its performance. Only the patient mind of a German workman could have conceived such heights of intricacy or wrought the mechanism of so many parts. The revolutions of the planets are recorded and the phases of the moon. At 15-minute intervals the Four Ages of Life, represented by appropriate symbols, pass before the figure of Death. At high noon, as the cathedral clock booms the hour, the 12 Apostles appear in succession, passing before the figure of Christ, who blesses each by raising His hand; and at the same time a cock flaps its wings and crows with a vehemence that echoes and re-echoes in the great vault, while an angel turns an hourglass.

Late one afternoon I toiled up the 300 odd steps to the platform at the base of the spire, which still loomed up as high again as I had come. And despite the caretaker's injunction to forego the remainder of the climb, if I was subject to dizziness, I started up, accompanied by an attendant to show the way. Up and up we went, seemingly no nearer the goal. But gradually the spire grew more and more narrow, the steps became more and more cramped, and the wind whistled through the open stonework with disconcerting violence. Nearing the lantern, the steps circled about the very outside, with no support to seize except the step above. A particularly vicious burst of wind came so near to brushing me off and depositing me on a housetop 460 feet below that in the confusion of the moment I reflected that good advice is ever ill received.

Another 60 seconds, during which time I concentrated on the advisability of placing the alternate foot on a precarious six inches of stone rather than the void that seemed so inevitable, brought us to the lantern, a tiny platform high above the city.

From this point of vantage I could see the Rhine glistening in the sunshine, with Germany extending along the other bank. To the west, the foothills of the Vosges rolled up in ascending masses to the crest of the range, with the villages of Alsace nestled in the valleys. Directly below, the River Ill wound through the city in lazy curves, embracing the Old Town within two diverging arms. The last rays of the sun, speeding obliquely over the mountains, sparkled upon the colored roofs of Strassburg, turning crimson the red stone of the cathedral that dropped so dizzily from under my feet.

I waited until it sank behind the hills, fascinated by the magical changes of color, and forgetful of the arduous descent. In a flash I recalled the statue in the Place de la Concorde in Paris of Strassburg, as one of the eight great cities of France, and in the next instant I realized that I had found in the beauty of the city something that was neither French nor German, but Alsatian.

Scotland Yard and the Finger Print

Concluded from page 6

hoped to meet him as chief of the most interesting department of Scotland Yard. I wanted to talk to him about his work and, more particularly, to express my appreciation of his sanity during the great world conflict, as experienced by myself, or, rather, Mrs. Thompson, in the winter of 1915.

At that time I was undoubtedly under surveillance by the British intelligence service, as was the case with every neutral national in Europe. Perhaps the surveillance in my case was more special than with others, because I had been in the American consular service in England and Germany; had also been at the front with the German armies and was generally known to be an avowed admirer of Germany and so forth, and so forth.

In any event, Mrs. Thompson had a purely personal and pressing occasion to go from Berlin to London. She got through without trouble, traveling with one of our diplomatic couriers, but, once in London, the Scotland Yard system enveloped her. It probably commenced in Berlin. She was called to headquarters to be interviewed by Sir Basil Thomson—called twice, in fact, and dismissed. But in this dismissal the human character of the English gentleman—we have to give them credit, for it is apparent under all circumstances—expressed itself (as might be compared with the hard-headed objective impersonality of the Germans) in the very definite pleasure he exhibited in proffering her the fullest protection and support whenever she might be ready to return to her husband in Berlin. Sir Basil is the scion of a noble family, and the son of an archbishop of the Church of England.

And she needed that support, as the home office refused to permit her to return under any circumstances.

In the end, however, on informing Sir Basil of her predicament, the permit was granted immediately and it was on this account that I wished to visit him, to thank him and compliment him on his maintenance of the superb standard of the English gentleman, at a time when a moderate degree of intolerance would have been perfectly excusable.

In picturing the outward aspect of Scotland Yard, it is something like this. Twenty-two thousand culled, selected and trained and tried men, sworn to His Gracious Majesty, agents first of the king, the royal family, and the ministers of the king, and then to Parliament and the people—this constitutes Scotland Yard. But the first allegiance is to the crown, that mysterious thing we Americans are expected to understand when told that it is a figurehead, a symbol or formula only of what is a truer democracy than we have in the "States."

I think the British "crown" has about the same significance as our flag idea has to us—allegiance to the crown, being the same as allegiance to the flag.

In the olden days these janizaries of the law, police and criminal investigators (detectives) making up the Scotland Yard of today, operated solely on the instructions of a judge or police magistrate, generally from Bow street, and they were called Bow street runners, or Robin Red Breasts. They wore red vests (waistcoats) for some reason or other.

All this is changed and that Scotland Yard, a modern expression of English order, and the popular name for the Metropolitan Police of the London area (a circle 15 miles out from Charing Cross, the geographical center of London) is a police organization, I am sure, superior to anything of its kind in the world. On the whole, the English people are proud of it, as well they may be.

In calculating his advertising field and potential clientele, Harry Selfridge, our American merchant lion in London, estimates a population within the circle mentioned of some 10,000,000. "To get down to brass tacks," using one of his preserved Chicagoisms, he says: "These people are here. This is London."

And Scotland Yard is the police force for London—the mighty—the terrific—the wonderful—an urban population plexus of more than 10,000,000 human beings.

Constantinople, Turkey, where the East and West meet. This scene from the market place shows the thoroughly modern buses and an ox team, also natives in modern costume and the same type of garments as used by their ancestors.

Indians Who Defy White Men's Encroachments

Menominees Endure While Other Tribes Have Vanished

By MARK G. TROXELL

"NEPHEW, you call yourself a man. Know, then, that among our people the brave warrior proves his valor by devouring the beating heart of a chief man." With these words the old Menominee handed the still-beating heart of a turtle to his adopted white nephew.

Now the phrase, chief man, is the ceremonial name among the Menominees for the snapping turtle. In tribal lore, it has great significance. The adopted white saw his dilemma at once: either he must eat the horrid raw flesh or be discountenanced in the eyes of his copper-tinted relatives.

"O, great uncle!" he replied. "I am a man, and will eat this heart. But you and your two comrades also are men. You shall share in this privilege." Solemnly the four men divided the organ—lately removed from a snapping turtle—and observed one century-old custom of the tribe.

This incident happened less than 10 years ago, at a spot less than 300 miles from Chicago. It gives a quick insight into the peculiar psychology of an unusual tribe.

When Jean Nicolet reached Wisconsin shores, in 1634, he found along the Menominee River a tribe of Indians known as Wild Rice Men. When the plucky Major Z. M. Pike visited the forests of what is now Upper Wisconsin, about 1805, he found a group of mild-mannered, self-respecting Indians who conducted themselves much as they had in the days of the early French explorers. And any casual visitor who in the summer of 1922 travels with observing eyes through the big Menominee reservation in Shawano and Oconto counties, Wisconsin, will find a race that catches the wary trout and harvests the wild rice in much the same manner as it did before Nicolet and his comrades appeared.

The Menominees are, beyond doubt, true old-timers. While they show traces of relationship to some of the old New York tribes, white men have known them only as Wisconsin Indians. Formerly, they controlled territory extending from north of Green Bay to south of Milwaukee. Instead of contesting for unattainable ends with the Great White Father who lives in the East, they drove clever bargains as incoming settlers encroached on their domain. Today they present the strongest tribal front of any group of Indians found east of the Mississippi River. In the forest and along the streams of their beautiful reservation—which covers 360 square miles in Northeast Wisconsin—they enjoy many of the privileges of early days, while obtaining virtually all the advantages of modern education, religion and medicine.

Other tribes have come and gone, but the Menominees remain strong in numbers. The earliest conservative estimates by white men concerning this tribe place its population at less than 2,000. Under the recent census, taken by E. A. Allen, superintendent of the reservation, the Menominees number 1,788. The once stronger Oneidas are scattered, the Chippewas and Sauks have largely disappeared. Yet north of Lake Shawano endures a tribe that defies the encroachment of the whites.

The Menominees are deserving of better than average Indian fortune. No Black Hawks nor Chief Josephs led their warriors in hopeless conflicts against the United States troops and settlers. When their sage leaders saw an inevitable narrowing of their ancient boundaries, they surrendered their claims (1848-1854) to southern domains and accepted a tract then regarded as confining, now viewed as adequate, for tribal hunting and agriculture. While they have been moved 100 or more miles from the scenes of their happiest hunting grounds, in tribal annals there is no record of hopeless and despairing migration such as mark the history of the Stockbridges, their one-time neighbors.

While not a tribe to produce leaders with war-making propensities, the Menominees have never lacked courage. The tale that John Keshena, son of Keshena, the Swift Flying One—the old chief in whose honor the quaint agency settlement on the reservation was named—told to Alanson Skinner, a well-known ethnologist, who spent years studying Menominees, illustrates his tribe's valor and justice.

"Once there was a brave man who had achieved distinction as a warrior. Every time he went out on the war path he returned with great glory. He was honored and respected by everyone, but his wife was an idle, vain woman who did not appreciate him. Once during his absence she formed an intrigue with a worthless fellow who had never done anything.

"When her husband returned everyone was eager to tell him about her misconduct. He paid no attention to strangers, but when his relatives spoke to him about it, he listened to their story. He decided to wait and see if his wife would return to his lodge.

"That night she came to his wigwam, but he ignored her. Rising at dawn, he dressed himself in his war clothes. When he had finished breakfast he took his knife and departed.

"In those days it was customary for the warriors, young and old, to lounge in little knots in some shady spot during the morning. The wronged husband visited several groups, and talked and jested with the men, but the one he sought was not there. All the warriors guessed that something unusual was going to happen, because of his clothes.

"At last he found the culprit. Concealing his knife and speaking pleasantly, he approached his enemy. When he was close to the man he suddenly stabbed him to the heart, so that he fell dead before all the people. For a moment the slayer gazed at his victim, then drew himself up and addressed the crowd.

"'I am a man! I did this deed courageously. Here is my knife.' He placed it on the breast of the corpse. 'I give myself up so that I may be slain with my own weapon. I am not afraid to die, for I am a man.' Then he sat down at the head of the dead man.

"The nephew of the victim was in the crowd. He sprang forward and snatched up the knife. 'You are not the only hero,' he cried. 'I also am brave!' With these words he stabbed the slayer to the heart. Then he, too, turned and placed the knife on his victim's breast and with a short speech surrendered his life to the dead man's relatives. Warrior after warrior performed his act of blood vengeance for his kinsmen and died in turn until at last eight men were killed.

"The tribe might have been sadly reduced had not the elders interfered and persuaded the remaining braves to hold a council. The chief arrived and he decided on the proper course of action. He sent the braves to fetch the woman who was at the bottom of all the trouble.

"This squaw, now a widow, did not want to go. She fled to her brother for protection. When he saw the police coming and learned what they wanted, he rebuked her and gave her up. They took her over to the place where the bodies lay.

"The chief addressed her sternly. 'See all the ruin you have caused. You had a noble husband, but you brought disgrace on him that could only be erased by the death of many good men. You are responsible for these crimes.'

"A deep wedge-shaped grave was dug. The woman was flung to the bottom, then the Indians put the corpses of her husband and the man he slew directly over her, and piled the other bodies on top. And so she was buried alive."

This strong sense of justice is a characteristic of the Menominees today. The present administration of the reservation recognizes this judicial temperament by having Indian judges render decisions on Indian offenses.

The Menominees are a wealthy tribe. At present $2,000,000 in undistributed funds is lying in the tribe's treasury. The children, numbering about 900, have invested $450,000 in Liberty bonds. This means that each child has $500 in Federal securities to his credit.

All these possessions have not robbed the Indians of their industry and initiative. Farm life on the reservation proceeds as evenly as elsewhere in Northern Wisconsin, and the houses, barns and fields are almost on a par with those of white settlers. Tepees are conspicuous by their absence; the passing tourist would scarcely know he was speeding through a reservation were it not for the predominance of copper-tinted faces and the unusual appearance of Keshena, the reservation's "capital."

Keshena is a hamlet some eight miles from the railroad, with but one main highway passing through it. Along its one winding street are found the big brick buildings of the government school, the lovely grounds of St. Joseph's Industrial School for Indians, the agency buildings, and the few stores of the place.

In spite of its comparative isolation, Keshena has its crowded days. One of these comes in September, when both schools open their doors to students. Under a ruling of Superintendent Allen, the Wisconsin state school laws are observed on the reservation. On the agency bulletin board through the summer months, one may read an open letter commanding all Indians to bring children of school age on opening day. The Indians being obedient, each opening day sees the village streets crowded with old-time traps, surreys, buckboards and wagons. Whether willing or unwilling, each autumn the young Indians begin a year of boarding school life at Uncle Sam's expense.

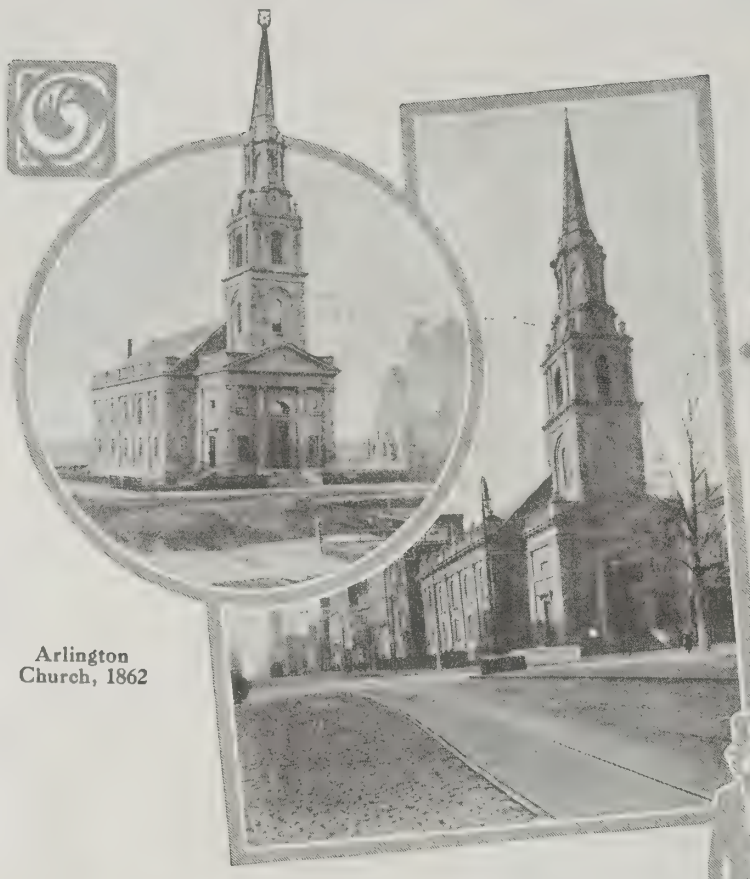
More than one-half the Menominees are Catholics. Last September, while 130 Indian youngsters were being enrolled at the government school, 180 children were being received by the sisters at St. Joseph's. The Catholic school is reimbursed by the United States for training the young Menominees.

The government school is situated on a beautiful 400-acre farm, and the Indian boys learn scientific agriculture.

The Menominees seem likely to endure as long as the white man. The past three centuries have been a severe test on all Indian tribes, and few have been able to withstand the white man's encroachments, while accepting his improvements. The proud record of the Menominees—in striking contrast to that of most tribes—seems proof that each year their quaint customs and kindly manners will become more familiar to an increasing number of white friends.

The Indian Fair brings out the old tribal costumes. The central figure, Henry Wolf, is an Indian judge and his power is recognized by those who break the laws of the reservation.

On nearing Keshena, one sees old Indians driving sedately to the village for a day's visit. This old chief is now nearing 90.



The main highway through the reservation passes Saint Joseph's, a Catholic boarding school for Indians.

The government school, Keshena, Wisconsin, is on a beautiful 400-acre farm, where young Indians plant and harvest the crops and supply all Keshena with dairy products.

Site of Colonnade Row, 1922

BOSTON is known as the cradle of American liberty. It was there that the spirit of independence among the colonists first manifested itself. Therefore, the city is rich in stirring incidents of American history. It was in Boston and near it that the first battles of the Revolution were fought. The city was first settled in 1630, and at the beginning of the eighteenth century it was the leading city of the country. It always has been a great literary and educational center, and in addition to having been the home of many patriots in the eighteenth century it sheltered a brilliant lot of men of letters in the nineteenth century. Many landmarks have passed out, but others are preserved. The Arlington Street Church, pictured on the opposite page, is successor to the Federal Street Church, the pulpit of which was occupied for many years by William Ellery Channing, who was the recognized leader of American Unitarians. He also was a brilliant writer on theological, social and philanthropic themes. On the same page is a picture of Old South Church, which figures largely in Boston history and that of America as well, for it was there the townspeople used to gather to protest against acts of the British Government in the years before the Revolution. Tremont street, as it appeared in 1869 and as it is today also is pictured there. This now is an important business thoroughfare. Franklin street in 1858 and the same street today is shown there, too; a striking contrast. On this page, at the top, is a picture of the home of Wendell Phillips, an eminent lawyer and reformer of Boston in the last century. He was an ardent abolitionist. In 1839 he withdrew from the practice of law through scruples against compliance with the attorney's oath to the Constitution. He declined to stand for Congress which he could not enter without swearing allegiance to that same Constitution. Below this picture is a view of Harrison avenue extension on the site of the Phillips home. In the center is Church Green in 1860 and below it is Church Green today. There is no green there now, just brick and mortar, but it still is called Church Green. At the top on the right is the famous Colonnade Row, Tremont street, in 1858, and below is the same section today, the Colonnade entirely obliterated.

Solving the Problems of Juvenile Delinquency

Concluded from page 7

get a word. Every Saturday in his court dozens of his wards come in to report. Each one is given car fare by the "Big Judge" and goes home rejoicing.

In one case Judge Sims had before him a boy who had been an old offender. His delinquency began with truancy from school. The boy had undertaken to steal food to avoid going home. He had slept in box cars, and finally was arrested for stealing wheat from a car.

The father stood before the court with the request that the boy be sent to the industrial school.

"Open your mouth," said the court to the offender.

"Adenoids, sure," murmured the court.

"Can you hear good?"

"No, sir; I can't hear all the teacher says, and they call me a dummy."

The boy was operated on and his hearing restored. He was graduated from the school with honors. Neither of the parents said they had noticed his being deaf.

Judge Sims never asks a confidential question until he is sure the boy is his friend. After he wins friendship he gets the truth, in most cases.

Many parents have been horrified at the statements their sons have made to the court in their presence.

Judge Sims says hundreds of cases of juvenile delinquency are traceable directly to the failure of the home to provide the necessary entertainment or pleasure for children.

"Understanding the children is the first and best weapon against the increase of juvenile criminals," said Judge Sims.

"Next is the understanding of the proper use of restraint, including force, and severe force when needed.

"Third, would be making the home a place of pleasure for the children, and fourth, would be against idleness.

"If every parent knew the correct recipe for rearing the boy, there would be very little need of the juvenile court.

"Society would profit if there were a course of training for parents on how to understand, rear and teach their children."

Judge Sims bears the distinction of having gained the confidence of more boys than any man in the Middle West. Those whom he has sent to industrial schools and reformatories because they were proof against redemption through court methods have returned home and personally thanked him.

He believes that force properly applied is one great remedy, and that force improperly applied is likewise a great injury.

He has been elected six consecutive terms as judge of the court.

BRIEFLY TOLD

Slave-raiding and trading have increased in Abyssinia during recent years. Abyssinia is in Northeastern Africa and is almost as large as Germany and France combined. In its capital, Adis Abeba, it is declared, there are more slaves than free men. It is claimed that gangs of slaves, chained together in rows, with women and children dragging themselves along beside the main body, can be seen by any traveler in Southern Abyssinia today.

A new chemical substance makes it possible for amateur photographers to develop photographs by a white light.

Measles are now being cured by a vaccine taken from the blood of measles convalescents. In Germany, experiments in about 2,000 cases have shown that the vaccine, when used in the first few days after infection, prevents exposed children becoming ill from the disease already in their systems in about 97 per cent of the cases.

The last units of the Imperial Guard of Germany recently marched out from Potsdam where, for centuries, they had served as the bodyguard of the Hohenzollerns.

Eight widows in the town of Auxerre, France, are to celebrate the 500th anniversary of an act of King Charles VII, decreeing that eight widows in that particular village shall always have rent free. A member of Charles' suite, who was wounded at the battle of Cravant, was nursed and cured by eight widows, and he provided for his nurses in his mansion in Auxerre. Later, Charles added the provision that the house should forever be the refuge of eight widows.

Cattle feed, absolutely fast dyes, motion picture films and many other things can be made from the 120,000,000 tons of corncobs and stalks now going to waste annually in the United States, according to chemical experts.

A lemon 14 inches in circumference and five inches in diameter, weighing two pounds and containing one pint of juice, was picked near Houston, Texas, recently.

Bandit wild bees invade the tame hives near Grays Harbor, Washington, and steal and carry away the honey to their hives in the forest. More than one-third of the domestic honey gathered in this district has been stolen by the robber bees. The wild bees make their homes in hollow trunks of cedar trees, where several swarms work on a community basis.

Gold badges for New York legislators, with the state's coat-of-arms and the names of the legislators inscribed on them, are sought in a bill introduced in the legislature recently.

"Jewish Influence on American Life," Volume III in the series on "The International Jew," comprises a third selection of articles on the Jewish Question, and is now off the press. It contains 256 pages, and will be sent for the cost of printing and mailing, which is 25 cents.

"The International Jew," Volume I, and "Jewish Activities in the United States," Volume II, 235 and 256 pages, sent for 25 cents each.

The first Mohammedan institute and mosque to be erected in France is being planned. High officials from the Poincaré ministry have expressed the government's wish that the followers of Mohammed worship under the Minaret with the same freedom as the French do in their Notre Dame.

Ministers of any religious organization, as well as their wives and minor children, are immune from the provisions of the immigration quota law, according to the ruling of a Federal judge in New York.

President Harding has shaken hands with more than 150,000 persons in the last year.

The tracks of prehistoric animals have been found in the solid rock on the summit of the dividing ridge between the Cumberland and Kentucky rivers near McKee, Kentucky, according to reports. One of the tracks is five-toed and 11 inches across.

More than 5,000 miles of railroad in the United States are operated with electricity, based on the single-track mileage, according to reports. This mileage does not include electric street, interurban and suburban lines.

Surgery with a pen knife recently saved the life of a two-year-old boy in Cincinnati. The child had strangled on a peanut and the physician, realizing that death would ensue before he could obtain his surgical instruments, slit open the boy's throat and incised the trachea just below where the peanut was lodged, permitting the passage of air. Later, the peanut was removed and the child recovered.

The residents of Monaco pay no taxes and they are not allowed to gamble. The tourists do the gambling.

No spot in New Zealand is more than 75 miles from the sea.

For the benefit of famine sufferers, the All-Russian Central Committee has decided to use the valuables in churches of all creeds in Russia. The valuables consist of gold and silver candlesticks, chalices, gold-covered and bejeweled icons and various ecclesiastical accessories worth about $1,500,000,000, according to reports.

The former kaiser's palace in Berlin has been used as a movie studio since the war ended.

Makers of phonograph records in London say the demand for private discs is increasing. Persons are having records of their own accomplishments made and are sending them to their friends instead of sending letters or gifts. The prattle and talk of children at various ages is being filed away with their baby clothes.

More than $1,672,000,000 was lost in fires in the United States during the five years between 1915 and 1920, of which $90,000,000 was attributable to smoking hazards—smouldering cigaret butts in waste paper baskets and other carelessness.

A national horseshoe pitchers' magazine is being published at Wilmington, Ohio, with Raymond B. Howard as editor and C. Ervin Sturm as business manager. It is the only publication of the kind in the United States and is called the *Horseshoe World*.

Ninety-seven per cent of Australia's population is of pure British descent.

A maid in a New York hotel died recently, leaving an estate of $15,500 earned by her own hands. Her pay was $16 a week.

The petition of Lady Rhondda to sit in the House of Lords has been granted by the committee on privileges of the House of Lords. She is a member of the directorates of 36 companies and chairman of several of the boards and will be the first woman to sit in the Upper House of the British Parliament.

An Illinois physician, 81 years of age, diagnosed his own ailment and wrote his own death certificate, which was signed by another doctor after his death.

By proclamation, President Harding has set aside a 593-acre tract in the Nevada National Forest as the Lehman Caves national monument. The caves are near Baker, Nevada, at the base of Mount Wheeler and are at an elevation of 7,200 feet. They contain stalactites and stalagmites, galleries and columns of rare beauty.

Urge Your Friends to Subscribe

THE DEARBORN INDEPENDENT is rapidly gaining in popularity. It is the type of publication persons demand for their homes. THE DEARBORN INDEPENDENT represents a wonderful magazine value—fifty-two issues—832 pages—for only $1.50.
Your friends will appreciate your asking them to subscribe. Give them this blank. They can forward it to us or leave subscription with the local Ford Agent who will gladly take care of it for them.

Adventure Seeker Finds Thrills in Photographing Wild Animals in Native Haunts

By COURTENAY SAVAGE

IT WAS Alexander the Great who cried in despair because there were no more worlds to conquer—yet hundreds of years later Columbus discovered a new world of which Alexander had never heard. And the modern fellow who sits around and wishes that he had been born a few hundred years ago when life was more adventurous—Well—

The jungle walled the river bank, casting black shadows at midday. Vines twisted their tendrils about the trunks of monster trees, and back in the forest water stood in pools formed by elephant tracks. Overhead a monkey scolded at the invasion of man, and a tropical bird echoed the cry. A huge crocodile splashed angrily into the river as the little party came ashore from the launch that hung in midstream, but the herd of water buffaloes, a little way down the river bank, looked curiously at the men—and went on grazing.

It was an odd party that had come from the launch, a lone white man with half a dozen natives. Some of the natives were armed, but the white man was not. Instead, he carried a tripod and camera, and with feverish, silent haste, he arranged his camera—and started making pictures of the water buffaloes. Suddenly the herd stirred. It was almost as if they resented having their pictures taken—and then, without a second's warning, they rushed toward the white man and his camera. They were huge, ungainly beasts, yet they charged with the swiftness of the wind. They were within a few feet of the camera before the man realized his danger. There was no time for guns, not even time to dodge. Heads down, they swept on. And then! Just as suddenly as they had started, they turned at a right angle and dashed into the river. The man and his camera were unharmed!

And yet, some folks say there is no adventure left in life!

Martin Johnson, the man who had stood behind the camera, was born and brought up at Independence, Kansas. As a lad he yearned for adventure. At 16 he went to Europe. He "hopped" freights to New York, worked his way over on a cattle ship, earned his living while he was there, and worked his way back. It was an adventure, but it only whetted the young man's appetite for more.

Then one evening, after he had been at home for several months, young Johnson picked up a magazine and read an article about Jack London and his proposed cruise of The Snark, a cruise which it was intended should encircle the globe. As young Johnson read it he made up his mind that he was going with London. Yes, sir, that sounded like a real adventure. So he wrote to Jack London that night—wrote such a good letter that at the end of a week a telegram arrived in Independence. It was from Jack London, and it contained three words, "Can you cook?"

Such a reply as that might have floored the average would-be adventurer, but not young Johnson. He thought it over for a minute, wired back "Yes," and then proceeded to learn how to cook. When he finally joined Jack London for the cruise, Johnson could really cook, and before the end of the voyage he was doing more than cooking—he was London's close friend and constant companion.

When a fellow gets a start like that he is pretty sure to go on with the job, and when the cruise of The Snark was abandoned after two years, because of Jack London's ill health, Martin worked his way until he completed the trip 'round the world—and he was back in Kansas, ready to start right out again.

This time he went rambling at the head of his own expedition, and armed with what had become his favorite weapon, a camera. He had been the unofficial photographer on The Snark trip, and he had become an expert. He returned to Kansas after a time and talked of settling down, but the lust of adventure was strong, and when the Kansas girl he married remarked that she hoped he was going wandering again, because she wanted to go along—well, there was nothing to do but go. Their first objective point was again the South Seas, but Martin Johnson was like Alexander, looking for new worlds to conquer.

Johnson finally decided on British North Borneo. The place was a tropical forest, through which few men had ever tracked. It abounded in wild beasts, large and small. Their next stop was to be Sandakan, the principal city of North Borneo, and located at the mouth of the Kinibatangan River.

The Johnsons had not been in Sandakan very long before the president of the British North Borneo Company called. He had heard that Johnson was going jungle hunting with a camera, and he wondered if he could have a set of all pictures made. He made an offer. He would give Johnson the use of the company's launch, coolies to carry the equipment, and an escort of native police boys, all the labor to be paid for by the company, in return for a copy of every picture made. Johnson accepted quickly.

Above—Martin Johnson, the Kansas boy who found that adventure had not vanished from this supposedly civilized world. Below—One of the blessings of the jungle was a "water vine," which when cut, would yield a pint of clear water. The picture shows Mrs. Johnson (she's from Kansas and accompanied her husband) getting a drink.

The start from Sandakan was made in the company's launch, which could be used for the first 140 miles up the Kinibatangan River. After that the journey to the headwaters, nearly 500 miles in all, was to be made in native boats—*gobongs*.

The first big game to be "shot" with the camera were crocodiles. The crocodile is the terror of the tropical rivers. A big crocodile will measure 12 or 15 feet, and is a mean customer.

Each day of the trip held its new adventure as the boat made its lazy way up-stream, against a strong current. In a few hours after leaving Sandakan, the jungle closed like a wall about the little party. It took three days to complete the first stage of the journey to Lamang, after which the launch could not be used. Three days of real adventure. Monkeys of every description chattered in the tree tops, scolding at the invasion of their territory. Tropical birds screeched, and snakes were numerous, both cobras and pythons. The pythons were largest, but the king cobras were more deadly, and sometimes were eight or nine feet long. Many species of wild animals were glimpsed along the shore. Johnson got a wonderful shot of a python that must have been 20 feet long. The reptile was coiled in a small tree.

The real adventures were above Lamang, for there the natives were really primitive and the beasts more abundant. This proved to be a great drawback, however, for while the wild animals were constantly heard in the forests, they were seldom seen. But Johnson determined that he was going to stay in the interior until he had obtained a really excellent collection of photographs of wild animals in their native haunts. It meant days of tramping along the small streams that run from the Kinibatangan River into the heart of the forests, hours of waiting for an animal to come out into the light, but in the end it was a worth-while adventure.

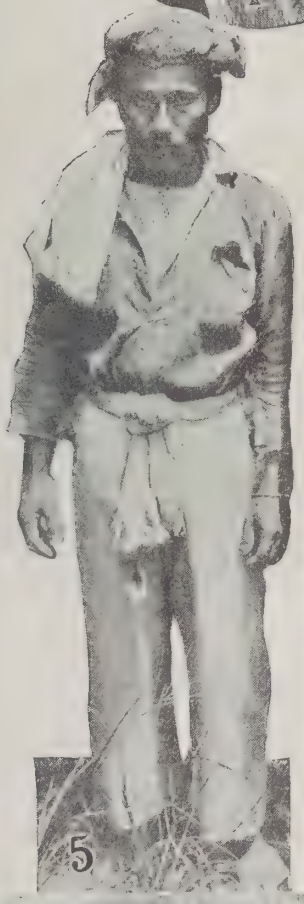
Apes and monkeys (the difference is that apes do not have tails) were always plentiful, so were the birds. A small wah-wah ape was as much interested in the workings of a camera as any stage beauty, and allowed the camera to be brought very close. Another time it was possible to photograph a gibbon as it took its daily exercise. The acrobatics of this particular ape were more thrilling than the circus stunts to be seen in more civilized lands. Another ape, a half-grown orang-outang, was much interested in the camera, and was so bold that Johnson had no difficulty capturing it. It became so tame that it was the pet of the expedition and was brought back to the United States.

Several herds of wild pigs, animals as large as young cattle, were photographed, and numerous species of wild deer. Tropical birds were common camera studies.

The climaxing adventure of all was the elephant hunt. Elephants were not uncommon, but they were extremely difficult to photograph. It finally required 20 days of real work to get some good elephant pictures; 20 days of rushing through the jungle tangles—and of being disappointed.

The only time that elephants can be found in the open spaces is early in the morning, for during the middle of the day they retreat into the depths of the forest, where it is cool and dark. Finally, the party came close to a small herd, so close that they could hear the huge beasts thrashing about in the underbrush. It was night, and the chief native hunter led the way to a forest track down which the beasts would go toward the water. A fallen tree crossed the trail, and Johnson mounted his camera on the trunk. Then they waited for daylight. Finally, the chief native hunter went on to see what the animals were doing, and he came flying back.

In a few minutes three elephants came crashing out of the underbrush. One of them sensed the man and his camera, and trumpeted. It was a cry to strike terror into any heart. The two other animals lifted their heads and joined in the trumpeting. Then suddenly the three beasts charged madly. Johnson ran and climbed a tree. The elephants rushed toward the trees, not sure where he had gone. For four hours they circled, trumpeting and thrashing about, and then suddenly turned off into the jungle. After the hunt Johnson ended the trip.



And what will Johnson do next? Well, there are men and beasts in Africa that no man has ever seen. Adventure is not dead. There are still some thrills left.

8

1. This wah-wah ape was not at all camera-shy, but sat and posed with all the poise of a motion picture actress.

2. A gibbon proved to be an acrobat that would have been a "hit" in an American circus. It does all sorts of tricks in the tree tops.

3. This baby black bear ambled out of the underbrush and was instantly made a pet of the expedition.

4. Tree tops proved a good place to photograph elephants, because the camera man didn't consider it exactly safe to "shoot" from the ground.

5-6. Two Malay pirates. Not quite the same as the bloodthirsty fellows who used to roam the South Seas, but pirates just the same, and wearing clothes looted from Chinese junks.

7. Near the headwaters of the Kinitbatangan River. The entire population of the village comes down to meet the gobongs carrying white travelers.

8. Pythons were numerous, and were frequently seen coiled in trees.

The Coal Strike

STRIKES are so often a collusion of so-called labor leaders with so-called leaders of industry, that it is not always possible to say where pretense leaves off and reality begins. Not only our judgment of the event, but our course of action with reference to it, is dependent on a knowledge of the inside facts, a knowledge which few possess. If among that few the government is one, and if the government has also a courage which it has not yet exhibited, the situation will be quite easily handled.

Whatever may be the significance of the present so-called "strike," there is always the problem of coal-mining. The economic problem is one thing, the human problem is another. If mine owners were less greedy and coal were sold to the public for the reasonable sum which could be so easily fixed under a public-spirited policy, there would still remain the manner in which men are compelled to mine coal by the present methods; that is to say, the human problem, to which the public's attention is hardly ever called, would still remain.

It is not primarily a question of hours and wages, it is a question of method. Mining is practically the only great modern industry where machinery has not come to the aid of men. The man and the mule and the pickax are still the mainstays of the trade, a trade which in time becomes so distasteful to a man of spirit it is with difficulty that it is kept sufficiently manned.

This in turn has led to cruel devices to hold men in bondage to the mine. Through company tenements and company stores with their lawless system of charges, through a sufficient number of lock-outs and strikes in the course of a year, the men are kept in debt-bondage, unable to abandon a thankless trade. A private police force, more like a private standing army, has more than once usurped a sovereignty that belongs only to the Government of the United States, and, altogether, the mining history of our country is one of its blackest spots.

That is the real problem. This present strike is related to it much or little, but the real problem is in the whole condition and method of the industry.

There is a large stock of coal in the country, and if the President fails to prevent the very obvious intention to profiteer, he will be confirming a feeling of futility and helplessness which ought not to be encouraged in this country at this time.

Pawnbroking and Hate

WALL STREET mouthpieces express vexation over the renewed insistence of the State Department that no private loans be floated for foreign nations or for state or municipal governments in foreign lands until the department has scrutinized and approved them.

It is a wonder that the money-lenders are not rubbing their hands with glee that it is regulation rather than prohibition of foreign loans which they must undergo.

Following the conclusion of the World War, several large loans were floated for foreign governments by international bankers in New York City. The foreign nations were in such financial condition that they were forced to accept the terms offered them. One of the typical loans was for the Belgian Government, an obligation nominally paying eight per cent, floated several points below par and payable at maturity at several points above par. Most of these loans, when commissions and all other things are considered, called for actual interest charges approximating 10 per cent a year.

International bankers assume no particular obligation through the loan flotations. The pretty bonds which they have engraved are passed on from large New York banks to smaller banks, which dare not refuse to accept them, and gradually through sales and resales finally find resting places in the vaults of insurance companies, trust companies and in the hands of individual investors. The international bankers act as agents for the payment of interest, but long before maturity of the bonds, their original connection with the deals is forgotten.

There was enough protest by foreign governments over the hard terms exacted in the making of the recent loans. But borrowing is vastly easier than paying. What protests there will be when the day of maturity arrives!

How easy it would be for a demagogue in some debt-burdened country to rise and point the finger of hate at the United States. He will not lack arguments for stirring the wrath of his countrymen over the hard usurious terms of the loans. And once started how tragically easy it would be to fan the fires of hate and envy into the conflagration of war! It would take only the act of a single crazed individual—the destruction of a Battleship Maine, the slaying of an archduke, almost anything—to spread the war fever broadcast.

Within recent months the United States has read again the lesson of loans. Indignant surprise in France, monumental obliviousness in England, hurt disbelief in Belgium—all these and more have gone toward proving the truth of Polonius' assertion that the loan oft loseth both itself and friend.

But these war-time loans were public ones, and the public must accept with equanimity its duty to bear the burden either of repudiation or re-payment with hate attached.

But for international bankers to be able for private gain to place the entire country in the shadow of a foreign hatred is manifestly unjust.

There was a good deal of surface congratulation over the war-time removal of the world's financial capital to New York. There should, instead, be a vast shame over the situation which permits, even temporarily, the United States to be looked upon as a pawnbroker nation.

But Look Whose Ox Was Gored

SOME years ago, a shudder spread over the continent at a proposition, for the relief of agriculture, that government provide storage for grain crops until a glutted market could be relieved and prices resumed normality. The thing was not to be thought of. Financial circles led the hue and cry against such paternalism, and the matter was dropped. The farmer, since as before, has been left to the mercy of the elevator interests, with what result he can tell you.

The recent change in the directorship of the United States mint required an inventory, which shows that Uncle Sam is providing storage for about three billions of dollars in gold owned by private interests, for which it furnishes paper money much more convenient to use. This gold, in coin and bullion, aggregates a third of the estimated world supply, and does not include that "in circulation" in the vaults of banks as reserve. Besides the gold holdings, there are 676 millions of silver and other assets in the various vaults of the mint service.

The difference between the storage of the farmer's grain and the banker's gold would be hard to distinguish, yet one is paternalism, fraught with danger to our institutions, while the other—is a government function.

Christianity and Economics

THERE is no better field for discussion by the religious press than the causes of the present unrest and it is a hopeful sign for the future that interest in economics is growing steadily in that class of journalism. If ever the need of religious belief has been shown in the affairs of men it is now, when apparently so much injustice prevails in civilization.

It is not at all necessary that the argument be one-sided, for the truth must prevail if properly presented, but it is very important that every person taking part shall to the best of his ability seek and state the truth as it appears to him, and respect the candid opinions of those who may differ. It is no time for mere partisanship or prejudice. No man deserves a hearing who will not or cannot base his belief on mature judgment and the teachings of his religion and the experience of the world.

The *Southern Churchman* (Episcopal) of Richmond, Virginia, in its issue of March 25, presents the first of a series of 13 articles on "Christianity and Economic Problems" which bids fair to be of great interest and a genuine contribution to the literature of the present political upheaval. It is to be hoped that the representative press of the other denominations will join in the discussion, for their clientele is of the class that goes to make up the real citizenship of the country, and this is the class that, once enlightened, may and must be relied on for the progress necessary to redeem the world.

England Calls, Mr. Gibbs

THE one circumstance that makes it difficult to believe that Sir Philip Gibbs is a propaganda agent of the British Government, is the fact that the British Government does not usually maintain stupid persons on the job, not to speak of offensive persons. Sir Philip, after a rather too generous taste of our good-natured tolerance, has overstepped that invisible line which all gentlemen observe.

Mr. Gibbs is a newspaper man and only that. He was privileged at the front to see certain things, and he wrote in straight fashion the things which he saw. He was a good but not a great war correspondent. After the war he became author, luring us by a title, "Now It Can Be Told," to a book which told nothing whatever that had not been told scores of times before. His next book has an equally luring title, as if the unknown truth packed away in Gibbs' brain is bursting for utterance—"More That Must Be Told."

This is all very well, and even the lecture tour was very well, and the second lecture tour, but when Sir Philip, the reporter, stands up to read stern lectures to the Government of the United States, he simply shows that strain of bumptiousness which culture, in his race, is supposed to hold in restraint. Mr. Gibbs doesn't know America, is forever barred from knowing America, so that ignorance is added to an impudence which has gone quite far enough.

If Gibbs has had intelligence enough to laugh in his sleeve at the figure we have allowed him to cut, he has intelligence enough to understand what the muffled criticism of him, in various parts of the country, is beginning to mean.

Mr. Gibbs talks exactly like a representative of the international crowd whose hatred of the United States exceeds that for any other nation. The international crowd had their plans all made as to which trap the United States was to walk into, and by just what route we were to enter; Mr. Gibbs, incidentally, being one of the small nibbles of cheese inducing our trapward progress. The United States, anciently wise, has spoiled the plans, whereupon diminutive Philip rises and squeaks a most Aguecheek protest against our government and our people.

The United States does not need Mr. Gibbs' counsel, and if it did Mr. Gibbs is not competent to counsel it. There is a country across the sea in greater need of Mr. Gibbs' earnest efforts than we are, and that country is Mr. Gibbs' own.

Rosenfeld and St. Paul

PROBABLY somewhat on the theory that cats may look at kings, a group of New York's self-confessed intellectuals has undertaken to grade 200 persons, widely known either in the ancient or modern world.

The ratings, based on a maximum of 25 plus and a minimum of 25 minus, are published in *Vanity Fair*. The judges who fixed the ratings were 10, including H. L. Mencken and George Jean Nathan, editors of *Smart Set*, Gilbert Seldes, editor of the *Dial*, and kindred spirits in the mutual admiration coterie which finds perverse pleasure and livelihood in jeering at modern civilization. All are writers, and except for two or three, they are writers of that queer modern school which imagines it is making literature when it twists and contorts language and thought into grotesque and oftentimes hideous literary gargoyles.

Messrs. Mencken and Nathan are among those graded. Mr. Mencken rates his own importance at Plus five, far above the figures with which he represents the standing of Roosevelt, Hughes, Northcliffe, Raphael, Dante, Cicero and Virgil. Mencken considers that he is on a par with Dr. Johnson, Jack Dempsey and Oscar Wilde. The 10 judges are unanimous for the eminence of Wilde in the kind of world they would have, their ratings averaging Plus 10.5. Flo Ziegfeld, who possesses the power to give free tickets to "The Follies," is rated plus by nine of the altruistic judges; the tenth rates him the absolute zero.

With a few exceptions, those graded by the judges are outstanding exemplars of the stalwart Nordic race to whose ascendancy the world owes Grecian culture and philosophy, Anglo-Saxon industry, Celtic chivalry, Teutonic music and art, English literature and American democracy.

It would be futile to attempt an analysis of the separate ratings of the judges. Quirks of character peculiar to each individual affected these.

It is the larger disqualification of the judges that affronts the common sense.

For Mencken to presume to grade Washington and Shakespeare is amusing. For Paul Rosenfeld or George Jean Nathan to rate St. Paul is pathetic. St. Paul's writings have lived for 19 centuries and will endure till the last lover of exalted literature dies; the writings of Rosenfeld or Nathan may wear for a month on the pantry shelves. For editors of *Smart Set* to grade John Milton, master of the sublime, is——but words fail.

Mr. Ford's Page

THE complaint against lawlessness has risen so high that the President himself was moved to add his condemnation, and there can be no doubt as to the kind of lawlessness he had in mind. The lawlessness which most needs to be denounced is not that kind of which the police and the courts take cognizance, but that which is permeating classes of society which we have too long regarded as respectable.

We seem to have forgotten that the word "respectable" means "worthy of respect," not merely well placed socially and financially, and adroitly able to keep out of the hands of the police. There is nothing more respectable in a rich man's orgy than in a poor man's; there is nothing more respectable in the domestic infidelities of the wealthy, than in the promiscuity of those abandoned persons who care nothing for appearances; there is nothing more respectable in the thievery of massive stock-jobbing operations than in the operations of the hold-up man who snatches a working girl's purse.

What you, as a normal human being, cannot respect when you see it reduced to its plain facts, is not respectable, in whatever social degree it may occur.

Respect for law is the trait of those races that are capable of freedom and of the highest civilization; all others are regulated by fear of law. Respect for law must rest on the assumption that law is the wisest expression of the collective wisdom of a people who desire to maintain and increase their liberties.

In its truest sense, law is not repressive but liberative. The law of mathematics sets us free in the kingdom of numbers. The law of letters sets us free in the realm of recorded thought. Law is the gateway into freedom. If we knew the economic law, if we knew the law of human relations, if we knew the total law of life, we should be free of economic chaos and its repressive power, we should be free of the intolerable burdens of human misunderstandings, we should be free of the various slaveries in which our ignorance and stupidity hold us today.

The law written by men upon the books may be faulty, indeed, it often is; but beneath it is the idea of law as the rule of freedom, the rule of liberation, the rule of enablement. And it is this *idea of law* which ought to be preserved alive in our minds.

Perhaps the enabling aspect of law has not been emphasized as much as it ought to have been. The repressive side has engaged practically all our attention. And yet it would be untrue to say that the repressive side is all wrong. When germs are tearing down the teeth and causing pain in the nerves and unrest and fever throughout the body, the first work of the dentist is repression. The organisms which are bent on destruction must be curbed; repairs must be made to enable the normal processes to function. Where there is no law there tends to be license, and when you wish to supplant license with liberty you establish law, which releases the higher forces and provides fields for their operations.

It is our repressive laws that are mostly under criticism today. They are always under criticism, of course, by those who are repressed; but nowadays they are also under scrutiny by those whom they do not touch at all. The reason is this: we think laws ought to be remedial and not punitive only. The punitive element is not separable from the remedial element, but in strict justice they go together. Our failure has been to emphasize the punitive element.

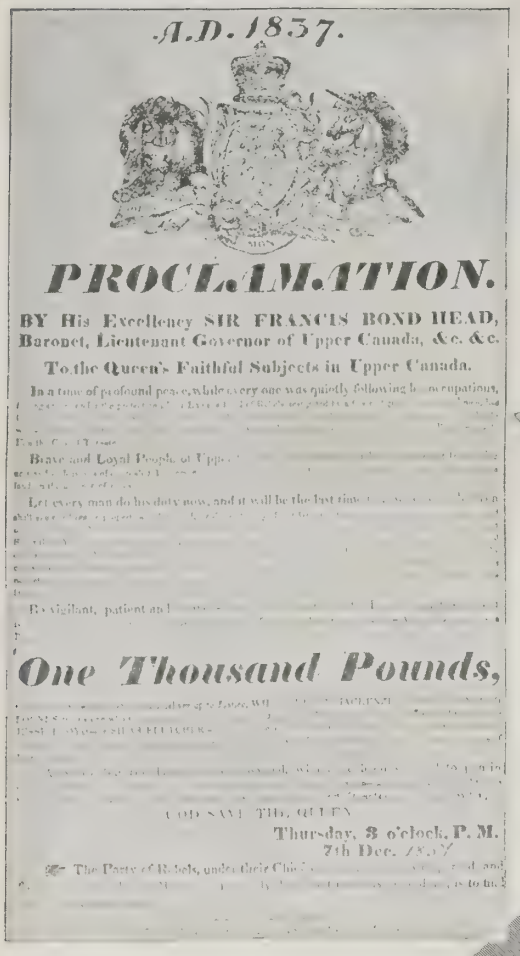
This has been done because men have taken counsel more of themselves than of the idea of justice. The idea of justice involves a restitution, and in that restitution the punitive element inevitably finds a place. In the old law, if a man stole an ox and killed it or sold it, he was required to restore five oxen in its place, and for a sheep, four sheep. If the stolen beast was found with him alive, then he was required to restore double. If he had nothing with which to repay, he was sold for his theft, that is, taken into forced labor until his debt to the principle of restitution was settled. He was not branded and brutalized. Justice was honored in the restitution. That is, a theft did not remain a theft; the thief was required to equalize matters out of his own energy. His punishment contributed to the restoration of the economic breach. But our modern form of punishment simply widens the breach: the crime itself is added to by the cost and waste of branding and brutalizing a man, without in any sense restoring the property or the man. Restitution, in which the sole loser is the offender, is the most effective repression.

If a man kills another, he should be compelled to take up that other man's burdens and carry them through. He should be compelled to labor under surveillance for the fulfillment of his victim's economic responsibilities. If his victim left children, the slayer should be put to work to support and educate those children. Murder would be a serious thing if murderers were thus compelled to live out the economic duties of the life they destroyed. And juries thus arranging for restitution would find truer verdicts. What is more wasteful than for the state to kill a man, losing two lives for one, and leaving families without the benefit of restitutive labor?

We need laws that enable people to do the right things that are waiting to be done, more than we need laws which prohibit them from doing the wrong things which they are allured to do because so many right ways are unopened.

For those classes of society that live well and are at their ease and affect an easy superiority to the law, the contempt of the people will prove a sufficient deterrent. In these days the designation of "lawless classes" is mounting the social scale. With regard to the Constitution of the United States it is becoming quite fashionable in upper circles to sneer. There was a day when sneering at the Constitution of the United States would have outlawed a man. That day has not passed. It is going to be felt quite keenly yet.

Some people, of course, pretend to believe that it is the Eighteenth Amendment that they sneer at. No, it is the Constitution of the United States. That national instrument is a whole. It never yet has been amended against itself. No article has ever been torn from it. No amendment or provision has ever fallen into disuse as an archaic fallacy. It is a living instrument, made by a living people, and it grows because it is alive. Those who think to stab its latest growth in stature are simply pitiable victims of a mushy patter that is alien in its origin and purpose, and anti-American to the core of its heart.



There will not be much of a nation left when this enmity to the Constitution of the United States becomes general—but it is not going to become general. The conscience of the American people, even that part of the people temporarily confused by alien propaganda, is suffering a revulsion against the degenerative poison and will spew it out.

At the same time, law must redeem itself. The more we turn to the enabling aspect of law the more we will make the right course possible and desirable, and in a society thus organized the repressive influences will become natural and not legal. Energies misdirected bring loss and trouble; rightly directed they bring prosperity and peace.

RESPECT for law is a sentiment restricted to people fit to be free; all others feel fear of law. Laws should be potent to enable as well as repress. They should be restitutive as well as punitive. Restitution is the highest corrective; it corrects the criminal; it repairs the economic breach made by the crime; it balances the record instead of merely stigmatizing the offender. We fail because it is not justice that we seek—justice all round; for society, for the citizen offended against, for the offender. Laws that merely make for the repressing of crime, and not also for the releasing of the normal moral energies, are one-sided. Law and liberty go together, when law is the instrument of justice. And such law always commands true respect.

The Mackenzies Finally Come Into Their Own

Grandson Now Premier of Country From Which Grandfather Was Forced to Flee

A.D. 1837.

PROCLAMATION.

BY His Excellency SIR FRANCIS BOND HEAD, Baronet, Lieutenant Governor of Upper Canada, &c. &c.

To the Queen's Faithful Subjects in Upper Canada.

In a time of profound peace, while every one was quietly following [illegible] occupations,

Brave and Loyal People of Upper

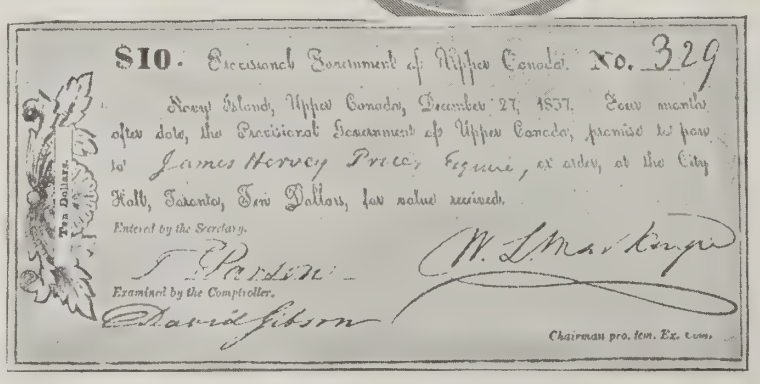
Let every man do his duty now, and it will be the last time

Be vigilant, patient and

One Thousand Pounds,

GOD SAVE THE QUEEN

Thursday, 3 o'clock, P. M. 7th Dec. 1837



The Party of Rebels, under their Chief

Proclamation offering a reward of one thousand pounds for the capture of Mackenzie.

W. L. MACKENZIE KING, New Premier of Canada.

WILLIAM LYON MACKENZIE

$10. Provisional Government of Upper Canada. No. 329

Navy Island, Upper Canada, December 27, 1837. Four months after date, the Provisional Government of Upper Canada, promise to pay to James Hervey Price, Esquire, or order, at the City Hall, Toronto, Ten Dollars, for value received.

Entered by the Secretary. T. Parsons

Examined by the Comptroller. David Gibson

W. L. Mackenzie

Chairman pro. tem. Ex. com.

Paper currency of Navy Island, headquarters of the rebels.

By D. M. LEBOURDAIS

IF BY any chance it was possible for the results of the last Canadian general elections to be transmitted to that region where dwell the souls of the departed, there is much reason to believe that the restless spirit of one William Lyon Mackenzie at last found peace. For it was then that his grandson, William Lyon Mackenzie King, became premier of Canada—the chief executive of that country from which he had been forced to flee in 1837, a rebel with a price on his head.

William Lyon Mackenzie was a Scotsman who emigrated to Canada in 1820, and after a few years' experience in business in Upper Canada, now the province of Ontario, launched forth on a career in which he was eventually to risk all and lose all, saving life itself only by a slim margin; and, finally, to go down to his grave in misery and want, heartbroken and in despair.

At the time of Mackenzie's arrival in Upper Canada the colonies had been suffering for some years under political disabilities which the passing of time seemed to increase rather than to assuage. The difficulties were inherent in the system, which included all the conditions essential to the establishment of a political oligarchy; and it is not strange, therefore, that the opportunity was not overlooked.

Governors changed frequently, but the governing classes in the colonies remained. As time passed, power and influence became more and more concentrated in the hands of the few. This governing clique in Upper Canada came to be known as the Family Compact.

During the four years that Mackenzie was in business he had been a more or less passive observer of public events, but his was not a nature that could long remain inactive where injustice existed. At this time such public journals as were published in the colony were almost completely under the dominance of the administration; criticism of public acts was a thing almost unknown. Mackenzie determined to put an end to this state of affairs and on May 18, 1824, published the first issue of the *Colonial Advocate,* which, although moderate in tone, and in some respects almost conservative, called forth the demand from an official organ that the young editor be banished from the country and his entire edition seized.

Even though Mackenzie's criticism of the prevailing political conditions was temperate and fairly impartial, his activities were not relished by those in power and he soon was made to feel the weight of official displeasure. This led to retaliation by him; and it was not long until Mackenzie had ceased to dissociate the individual from the system: his criticism grew more and more personal. He became relentless in his attacks on the members of the ruling faction.

It was perhaps inevitable that a man of Mackenzie's temperament should eventually become more intimately identified with the political life of the community, and in the elections of 1828 he was returned as one of the two members for the county of York.

Mackenzie soon became one of the most active members of the new assembly. He was appointed chairman of various investigation committees. A great many resolutions condemning the abuses of the period were introduced by him and, with few exceptions, carried by large majorities, but they were ignored by the government.

The life of Parliament having been cut short by the death of George IV in 1830—the rule then being that Parliament must cease with the life of the king—the Reform party was severely beaten at the ensuing elections. But undaunted by the fact that he was now of the minority, Mackenzie continued his hunt for grievances, though, of course, he received no support. Unable to make progress in the legislature, he launched bitter attacks against his political opponents in the columns of the *Advocate.* Five times during the next four years was Mackenzie expelled from the house because of his attacks; and each time did his faithful constituents re-elect him.

The Whigs in England having come into office in 1830, Mackenzie felt that perhaps the best way to mitigate the evils which afflicted the colony was by striking at the top. Consequently, he circulated monster petitions for signature throughout the province; and armed with these set sail for London in May, 1832, to place his complaints before the colonial secretary in person. He was favorably received and succeeded in having a number of grievances redressed; but, of course, the system still remained.

When Mackenzie returned to Upper Canada in 1833 he again attempted to take his seat, but as usual without avail. His success in London and the persecution which he had suffered at the hands of the assembly had raised him to the rank of a popular hero; and on the town of York becoming incorporated as a city under the name of Toronto on March 6, 1834, he was elected its first mayor.

The next general elections, held in October, 1834, resulted in a complete success for the Reformers, and Mackenzie, of course, was re-elected. Immediately, he obtained the appointment of a committee on grievances, of which he was made chairman. It went fully into every question at issue and resulted in the famous Seventh Report on Grievances, a copy of which was sent to the colonial secretary. One effect of this was the appointment of a new governor—Sir Francis Bond Head.

In appointing Sir F. B. Head, the intention was to get away from the military governors of the past, but a man less fit for the position could scarcely have been found. The word "democracy" almost drove him frantic; and every person of democratic tendencies was immediately suspected of treasonable intentions.

Dominated as it was by the Reformers, the assembly passed strongly worded resolutions condemning the attitude of the governor and finally refused to vote money for supplies, with the result that the governor dissolved the house in May, 1836, although it had barely run half its legal term.

The elections which followed were perhaps the most momentous ever held in Canada before or since, save one. The governor actually took part in the campaign against the Reformers: they were republicans, democrats and traitors. The influence of his position was used in every way to intimidate voters and to effect the defeat of the Reform party. Elections were then conducted under the system of open voting, which lent itself very easily to intimidation. The result was a surprise even to the victors: the Reformers were hopelessly beaten. The principal Reform leaders, including Mackenzie, were defeated. Sir Francis was jubilant. He wrote to the colonial secretary that he had "saved the Canadas."

Mackenzie's defeat and the failure of his party was the turning point in his career. Previous to this he had pinned his hopes on reform through constitutional measures; now his mind turned to thoughts of other means. A demand for an investigation into the election methods of his opponent in York County being refused by the assembly, he grew bitter. Having discontinued the *Advocate* some time before, Mackenzie had intended to quit the troubled paths of journalism forever, but there is only one end to the labors of the true journalist! He found the call of printers' ink irresistible and on July 4 (significant date!), 1836, there appeared the first number of a new journal, the *Constitution.* The tone of his writings now indicated the change that had overtaken the man: bitterness and more than usual recklessness were the dominant notes of the new publication.

Meanwhile, events were going steadily against the Reformers. Conditions in the sister colony of Lower Canada were approaching a crisis, and the pulses of men were beginning to stir with premonitions of the impending clash of arms.

There was no hope of redress from those in control. As the summer of 1837 advanced the swing toward armed resistance became more marked. On July 31, the first step along the road to rebellion was taken, when a declaration, afterward called the "Declaration of Independence," of Upper Canada, was adopted at a meeting of prominent Reformers in Toronto. It declared the aims of the Reformers to be directed toward the attainment of "cheap, honest and responsible government"; it recited a long list of grievances, and proclaimed that the time had come for the assertion of popular rights. It called on all friends of freedom to co-operate toward this end; and, to effect such co-operation, recommended the formation of political organizations, the holding of public meetings throughout the districts, and a province-wide convention to be held in Toronto. A local executive body, called the "permanent vigilance committee," was formed with Mackenzie as "agent and corresponding secretary."

Mackenzie now set out to organize the country. For this work he was peculiarly adapted. He was a born agitator and possessed the faculty of creating intense enthusiasm in his hearers. From August 1 until the beginning of December about 200 meetings were held, at most of which Mackenzie was the moving spirit. In nearly every case the Toronto Declaration was read and adopted. In addition, about 150 vigilance committees were formed. Squads of men drilling were not uncommon sights in the country districts, and a sudden enthusiasm developed for target shooting.

The governor and his satellites were fully aware of the activities of the Reformers, but such was the con-

"Pap" and "Privilege": The Good Old Game

Bosses and Ward-heelers Lose When Saloon Control Passes Out

By HARPER LEECH

CHAOS rules city politics today in the big cities and in the little ones. Here and there chaos shows signs of taking form as burlesque. The election of a whole flock of freak mayors last autumn throughout the country bids fair to be eclipsed by even more bizarre results in the spring primaries and the November elections. The voters, as usual, are at sea. They generally are before the bosses make the nominations for them. What makes the thing worth writing about is that the professionals are hopelessly confused. They are running around like chickens with their heads chopped off. Vainly they ask each other what it's all about. The old tricks do not work. The "boys" are used to spasmodic reform movements but they face nothing of that sort now. Dimly they sense that the people are hopelessly calloused to all the old appeals, and that the machinery has slipped its gears. What they do not realize is that they are witnessing the break-up of a system. The whole science of political tactics, as they have learned it, is melting away.

Municipal politics is at once the most fascinating American sport and democracy's most valid opportunity to express itself in terms of real achievement. In the conduct of cities and their affairs their populations deal with matters that affect their daily lives and are confronted with concrete problems which come within the range of the most ordinary cultural development. It has been well said that city polity is only housekeeping writ large.

"Sham Battles" in National Politics

IN NATIONAL politics the issues are comparatively remote and their connection with the individual's weal or woe is obscure. Within the memory of many men now living the only direct contact that millions of Americans ever established with the Federal Government was in some trifling transaction like the purchase of a postage stamp. Its recent expansion of functions has affected normal folk far less than the criminal or the adventurous. The inertia of the great national mass has served to inhibit political action of such immediate or vital import as would be felt immediately by the average citizen. As a result most of our national political struggles have assumed the form of confused sham battles over abstractions and rather vague general principles, which to the masses of the people have assumed the form and functions of grandiose phrases, pat formulas and slogans of a mystic or talismanic character, supplying the well-known mechanism for mob or crowd suggestion. The political struggles fought by the masses marshaled by these well-known methods of mass psychology, have been comparatively harmless and nearly always futile. The tremendous changes wrought in the warp and woof of American life and industry have not proceeded from the politicians. We are what we are today as the result of the silent racial and economic forces which have worked silently but swiftly and ruthlessly under the clouds of political chatter and froth, which have served to hide them from the less discerning. American history has been very little wrought out on the hustings or in the legislative assemblies, and less in recent generations than before.

City politics, on the other hand, is a matter of the roundsman on the beat or the garbage can on the back porch. Notwithstanding its intimate relationship to the life of the people it is a fact that for a generation or two they have been systematically manipulated by the same methods of mass psychology that have preempted the larger field. The expression "political game" tells the story. It has been a game which the voter has pictured to himself as something like a struggle on the football field, involving the elements of chance, skill and character, but to the professionals it has been a science—a system of tactics—comparable to chess rather than to sports involving more uncertain elements.

Same Old Machine-like Methods
